NEW YORK, THURSDAY, JULY 2, 1903

No. 2848

Survey of the World

The Postal Service Frauds

The suggestion of the President, Attorney-General Knox retained, on the 23d ult., as special assistants for the prosecution of persons indicted in connection with the postal service frauds, and for the examination of charges against persons not yet indicted, Mr. Charles J. Bonaparte, of Baltimore, and Mr. Holmes Conrad, of Washington, formerly Solicitor-General. The suggestion was made in a letter written on the 22d, in which the President spoke briefly of the results of the investigation and then said:

"There can be no greater offense against the Government than a breach of trust on the part of a public official, or the dishonest management of his office, and, of course, every effort must be exerted to bring such offenders to punishment by the utmost rigor of the law. The District Attorney's office of the District of Columbia has faithfully and zealously seconded the efforts of the Post Office Department in this matter, but the amount of work in the office is such as to make it difficult, without neglecting other important public duties, to devote all the time necessary to the prosecution of these cases.

"I suggest, therefore, that, if you cannot detail some of your present staff, you appoint special assistants in these Post Office cases, not only to take up the cases in which indictments have been found or hereafter may be found, but to examine into all charges that have been made against officials in the postal service, with a view to the removal and prosecution of all guilty men in the service and the prosecution of guilty men, whether in the service or not, where the cases are not barred by the statute of limitations."

Mr. Bonaparte is widely known as an advocate of civil service reform. A leader of the Maryland bar, he is not-

ably independent in politics, altho acting with the Republican party, and is regarded as a relentless enemy of all rascals in office. He is a graduate of Harvard and an Overseer of that university. Mr. Conrad, a Democrat, was an Assistant Attorney-General under Mr. Olney and afterward Solicitor-General.—Several additional indictments were found last week, four of them against ex-Representative Edmund H. Driggs, of Brooklyn, who is charged with receiving unlawfully from the Brandt-Dent Automatic Cashier Company \$12,500 for procuring from the Post Office Department a contract for the purchase of automatic cashier machines. With him was indicted George F. Miller, an agent of the company. Mr. Driggs, a Democrat, was in Congress from 1897 to 1901, and is now Vice-President of a surety company. He is a lawyer and a trustee of St. Mark's Methodist Church (Brooklyn), and was the candidate of his party two years ago for President of Brooklyn Borough. In March, 1900, while in Congress, he sharply attacked the management of the War Department's transport service at ports on the Pacific Coast, demanding an investigation concerning official reports which appeared to disclose extensive frauds. We explained last week the charges which led to his indictment. In Washington, indictments were found against ex-Superintendent Machen, the Groff brothers and Mr. and Mrs. George E. Lorenz, of Toledo. The two last named are said have been agents for the transmission of bribes from the sellers of the mail-box fasteners to Machen. Mr. Lorenz was formerly

postmaster at Toledo.—It is reported in Washington that Postmaster-General Payne will not resign. Senator Hanna says that the President would not accept his resignation if it should be offered. Mr. Payne is in poor health.—Charges having been published relating to the purchase of manifold paper for registry blanks or books, Third Assistant Madden resented them and defended himself in a letter to Mr. Payne, at the same time appearing to attack First Assistant Wynne and Fourth Assistant Bristow. This letter he gave to the public before it could reach Mr. Payne. Some comment has been caused by this evidence of friction in the Department. The published charges are regarded as affecting Representative Sibley, of Pennsylvania, who defends himself in a published statement.—It is shown that among those taken into the service by appointment in a small office, without competitive examination, and by transfer a few days later to an office in a large city, where he received a very comfortable salary, was John B. Heath, brother of Perry S. Heath, then First Assistant Postmaster-General. — Mr. Charles Emory Smith, formerly Postmaster-General, has made (in a letter to Mr. Payne) an additional statement concerning the Tulloch charges. These were submitted to him in 1899, and were the subject of examination and a report. This report he publishes, saying that it reduced the matters open to question to the appointment of thirteen clerks and seven cleaners. In another statement he intends to consider the Civil Service Commission's report as to evasions of the Civil Service law. Speaking of the charge relating to the charwomen or cleaners who apparently were doing no work, he says that he had personal knowledge of and personal interest in only one of these appointments:

"That was the case of a most estimable newspaper woman, long a successful Washington correspondent, whom I had known for 25 years, and who, through misfortune, was in much distress. Knowing her need and being able to help her, I should have been a brute if I had failed to do so. As she was not on the roll of eligibles, she could not be

made a clerk, and I requested that a place should be found for her on the roll of laborers. Months afterward I learned, to my surprise, that she was enrolled as a cleaner, and, tho a refined lady of education, had conscientiously been doing a cleaner's work. Immediately I sought to find a place more suitable to her position and antecedents, and happily succeeded. That was absolutely the only case of all involved in which I had any personal part."

✱

Negroes Lynched and Burned

Two negroes have been lynched and burned at the stake in Northern States since June 1st. In Belleville, Ill., on June 6th, a negro teacher named Wyatt shot the County School Superintendent, Charles Hertel, because the latter had refused to renew his teaching certificate. That night a mob took Wyatt from jail, hanged him to a telephone pole until he was half dead, and then bound him at the base of the pole, where he was burned, after coal oil had been poured over him. Thus far neither the local nor the State authorities have undertaken to prosecute the guilty, who are well known, but whom, it is said, no jury in the county would indict or convict.—In the four days following this crime, seven negroes were lynched in the South, all for killing white men, and one was lynched by a mob in Indianapolis because he was seen to be talking with a white girl who was annoyed by what he said.—The second burning took place in the outskirts of Wilmington, Del., on the night of June 22d, and the lynched man was George White, a negro who had been arrested for assault and murder. In the afternoon of the 15th, Miss Helen A. Bishop, seventeen years old, the daughter of the Rev. E. A. Bishop, was assaulted while returning from the Wilmington High School to her home, four miles from the city, her father being the Superintendent of the Ferris Industrial School. She had three-quarters of a mile to walk, from the electric railroad to the house. When found she was not dead, but she died on the following day without regaining consciousness. White, a laborer on a neighboring farm, was arrested on suspicion. Altho only 27 years old, he had passed nine years in prison, four of them for an assault like this one. It is

now known that on the Wednesday preceding his death he confessed to the Chief of Police in the County Workhouse Prison where he was confined. This confession he repeated while the mob was preparing to burn him. The local judges were urged to hold a special session of court for the trial of White, but they preferred to postpone action until September. On the 22d a coroner's jury declared that White was the guilty man. That night a mob of 5,000 persons gathered at the Workhouse Prison; 500 of them forced their way in and got possession of the prisoner. There was some resistance, but the armed guards did not shoot to kill. Careful preparation had been made by the lynchers, among whom were skilled mechanics who brought the tools needed for cutting the iron doors. White was borne to the spot where his crime had been committed. There, between midnight and two A. M. he was burned at the stake in the presence of a large assembly. Only one arrest has since been made. A man named Cornell was taken into custody, but a mob of 5,000 demanded that he be set free, and he was at once released on bail. It was announced, after the Governor, the Attorney-General and other officers had held a conference, that no arrests would be made for some weeks to come, and it is believed that there will be no attempt whatever to punish the lynchers. All the leaders are well known, but public opinion is said to be overwhelmingly in their favor. While nearly all of them were residents of Wilmington and the vicinity, one is said to have been a Texan who assisted in lynching, some years ago, a negro who had assaulted and murdered his sister. This man, the reports say, sought afterward to promote the lynching of all negroes guilty of similar crimes, and had been a leader at twelve lynchings when he was drawn to Wilmington by the murder of Miss Bishop.—A meeting attended by nearly all of the clergymen in Wilmington denounced by resolutions the crime of the mob. Before the lynching of White, the father of Miss Bishop urged the people to let the law take its course; but the Rev. Robert A. Elwood, pastor of one of the Presbyterian churches, preached, on the evening preceding the

lynching, a sermon which is believed to have encouraged and incited the mob. He displayed fallen leaves stained with Miss Bishop's blood, denounced the judges for declining to hold a special session of court, and declared that they would be responsible if the negro should be lynched. If White's trial should be delayed until September, and if he should at that time escape capital punishment, he ought then to be lynched, said Mr. Elwood, "to uphold the majesty of the law."—Since the death of White seven negroes have been lynched in the South, four for killing white men, one for assault upon a white girl, and one for breaking a white man's arm.—In Alabama, J. W. Pace, a planter, has been found guilty of holding negroes in peonage and been sentenced to be imprisoned for five years.

Iowa Democratic Convention

The Democrats of Iowa, in their convention, on the 24th ult., declined by a vote of 464 to 354 to reaffirm the Kansas City silver platform. In the Platform Committee the vote was 7 to 4. The nominee for Governor, however (J. B. Sullivan, of Creston), is a silverite and a faithful follower of Mr. Bryan. An attempt was made to commit the party to the support of Government ownership of the railroads and mines, but the vote against it was 628 to 199. Trusts and the tariff as related to them were made the chief issue. The temporary chairman said in his address: "The silver was dead and imperialism is dead; wait; the party should attack 'the new feudalism of the Trusts.'" "The once free-born American," he continued, "is now born into a monopolized and fenced-up world, in which he must walk in the mighty shadow of the owners of his country, and ask of them the right to labor, life, liberty and the pursuit of happiness." The platform calls for the removal of tariff duties on Trust-made goods and for a tariff "for revenue only," asserting that the present tariff is the creator of great unearned fortunes and the shelter of huge combinations. It opposes the Aldrich currency bill, demands a Congressional investigation of the postal service frauds, and says that

the Filipinos and Porto Ricans should be allowed to govern themselves. Railroad charges should be so limited, it adds, that they will yield only a reasonable return upon the capital actually invested; and when the sources of the supply of any product are owned by persons who combine to extort unreasonable prices from the people, the Government should secure an equitable distribution of such products, with only fair compensation to the owners, "so that the design of nature in making provision for the wants of man may not be perverted into means for his oppression."

Workmen and Employers

The strike of the street railway employees in Richmond, Va., has been accompanied by great disorder, and troops have been on guard there for several days. On the 22d ult. the rioting began, and on the following day the mob was in full control. The police, reported to be in sympathy with the strikers, were unable to preserve order, and the local militia was called out. Companies from other cities were added afterward, and before the end of the week 2,000 soldiers were on duty. Mayor R. M. Taylor (a candidate for re-election), addressing a riotous assembly at the car barns on the 23d, said: "I am with you, boys, and have been from the first." He then asked the mob to disperse, and also ordered a non-union motorman to start a car which had been obstructed. The mob did not disperse, but knocked down the motorman. For two days thereafter there was continuous disorder, and the cars were attacked and obstructed. From one car, after several persons in it had been injured, the military guards fired upon the mob, wounding six of the rioters. That night only one car went over the line. It was full of soldiers, and was preceded by militia and a Gatling gun. A captain was seriously injured by a torpedo. On the 26th, a young man named Wilcox was shot in the hip after he had thrown stones at the soldiers on a car. Merchants whose employees used the cars were boycotted. At last accounts the company was running a few cars with the help of the militia.—In New York, the end of the long contest in the building industry does not seem to be at hand.

Parks, the walking delegate who was recently arrested on five charges of blackmail and extortion, has been re-elected by his union with an increased majority, and it is said that he will be made President of the Board of Building Trades, which is composed of nearly forty unions. His victory is believed to be one cause of the return to the Board of the unions of skilled mechanics that seceded two or three weeks ago, and that made overtures to the builders for an agreement. The Board now presents a solid front against the builders, opposing their new arbitration plan, which is designed to eliminate walking delegates and to prevent sympathetic strikes. The men decline to consider the plan unless they shall first be set at work. On the 25th a general strike was ordered, and those remaining at work on the great buildings were called off by a party of 40 walking delegates, led by Parks. The loss in wages has exceeded \$15,000,000. Attempts to procure a settlement are being made by the Civic Federation.—The printers in the New York newspaper offices asked for more pay. The two arbitrators selected chose as an umpire Bishop Burgess, of Long Island. This decision was against the desired increase of wages.—It is said upon good authority that ex-President Cleveland's name was at the head of Mr. Roosevelt's list of those whom he desired to appoint as members of the Coal Strike Commission, and that it was taken off only because the conditions and qualifications specified by the railroad companies excluded it.

The Canal Treaty

Last week's brief dispatches from Colombia indicated a favorable change in the situation at Bogota with respect to the canal treaty. Prominent members of Congress who had opposed the treaty were said to have become supporters of it. On the other hand, the Senate elected for its President Joaquin Velez, formerly Minister to Italy, who was known as an opponent of ratification. In the House the motion of an opponent of the treaty, calling for all the papers in the case, was lost, 38 to 5, and this was regarded as a victory for the treaty's friends. In his

message President Marroquin said there had been presented to the Government the dilemma of permitting Colombian sovereignty to suffer detriment, or of renouncing certain advantages. If sovereignty should be sacrificed, the Government would be accused of failing to defend the interests of the nation; if the canal should not be made, it would be accused of depriving the nation of great benefits. He had permitted it to be known that he desired that the canal should be constructed. "I believe," said he, "that even at such cost of sacrifices we ought not to put obstacles in the way of such a grand undertaking, because it is an immensely beneficial enterprise for the country, and also because, once the canal is opened by the United States, our relations will become more intimate and extensive, while our industry, commerce and wealth will gain incalculably."

**The Kishineff
Massacre**

The official investigation into the massacre at Kishineff progresses without accomplishing anything or bringing anything to light. Dr. Doroshevsky, who devoted himself to the relief of the sufferers and showed himself fearless in publishing the true facts, has been forced to resign his place in the Bessarabian Provincial Hospital. Correspondents to the Paris press, with how much truth cannot be said, declare that the Czar has had a private investigation made into the Kishineff outrages and has been deeply affected by the reports returned to him. He is said also to be sensitive to the opinion of the foreign press in the matter. In discussing the affair he has sought advice from M. Witte, the Minister of Finance, and Prince Khilkoff, Minister of Ways and Means of Transportation, who was educated in America, rather than from M. Plehve, the Minister of the Interior. President Roosevelt has consented to transmit to the Czar a petition framed by the Executive Council of the B'nai B'rith in regard to the treatment of Jews in Russia. The following note has been sent by Secretary Hay to Simon Wolf, of Washington:

Department of State,
Washington, June 24th, 1903.

Dear Sir: The President has concluded to transmit to the Russian Government the peti-

tion of which you presented him a draft on the 15th of this month. The matter which he had to consider most seriously was whether or not such a proceeding would be to the advantage of your persecuted and outraged co-religionists in Russia. On this point he has decided to accept your opinion and that of the numerous and intelligent groups of American citizens of the Jewish faith whom you represent. He requests that you will send him the petition in due form at your earliest convenience. Of course, you will understand that the President cannot tell you what reception your petition will meet with at the hands of the Russian Government. I am, Sir, faithfully yours,
JOHN HAY.

The petition itself is drawn up in language not calculated to give offense. It declares that under ordinary conditions the calamity of Kishineff would be deplored without undue fear of a recurrence. But that the petitioners are advised that millions of Jews—Russian subjects—dwelling in Southwestern Russia, are in constant dread of fresh outbreaks. They feel that ignorance, superstition and bigotry, as exemplified by the rioters, are ever ready to persecute them; that the local officials, unless thereunto specially admonished, cannot be relied on as strenuous protectors of their peace and security; that a public sentiment of hostility has been engendered against them and hangs over them as a continuing menace. The petition declares that no estimate is possible of the misery suffered by the helpless Jews, who feel driven to forsake their native land, to sever the most sacred ties, and to wander forth to strange countries. It closes with these words:

"Far removed from your Majesty's dominions, living under different conditions, and owing allegiance to another Government, your petitioners yet venture in the name of civilization to plead for religious liberty and tolerance; to plead that he who led his own people and all others to the shrine of peace will add new luster to his reign and fame by leading a new movement that shall commit the whole world in opposition to religious persecutions."

It is extremely doubtful whether the petition will ever reach the Czar. More probably it will be returned to the American Ambassador at St. Petersburg with the polite intimation that as Russia permits other countries to administer their interior affairs without foreign intermeddling, so she claims this same privi-

lege for herself. Count Cassini, the Russian Ambassador to Washington, is much distressed over the present turn of affairs.

England In Parliament, June 24th, Mr. Wyndham, Chief Secretary for Ireland, introduced an amendment to the Irish Land bill which enlarges the purchasing rights of tenants and which was received by John Redmond and others enthusiastically. The debate which followed was entirely amicable and the bill is regarded as saved.—At a luncheon of the Constitutional Club, June 26th, Mr. Chamberlain was presented with an address, inclosed in a casket, in recognition of his services to the nation. The presentation speech was made by Premier Balfour, who declared, among other things, that it was foolish for the Conservatist-Union party to make opinions on economic matters a test of party loyalty. In his reply Mr. Chamberlain repudiated the notion of any personal competition between himself and Mr. Balfour. He could not conceive of any occurrence which should sever the political and personal friendship between them. He wished to state emphatically his belief that the leadership of Mr. Balfour was essential to the success of the Unionist party. If the Unionist alliance was dissolved or weakened, the "home rule" snake, which was only scotched and not killed, would again come to the front.—In the "Official Bulletin of the Congo Free State" there has appeared a formal denial of the charges made against that Government by Sir Charles Dilke and others in the British Parliament. The article, which was inspired by King Leopold himself, declares that the Government of the Free State has not violated the provisions of the Berlin Conference, and asserts that to-day the negroes are better housed, clothed and fed than they were fifteen years ago.

King Peter of Servia At 10 o'clock in the morning of June 24th King Peter reached Belgrade and was received with apparent enthusiasm by his

new ministers and subjects. The city had been decorated for his reception, and at the railway station to meet him were assembled the Government officials, military authorities and leading citizens, together with the Russian and Austrian ministers, the representatives of the other countries being conspicuous by their absence. From the railway station the King drove to the cathedral, where mass was celebrated and where in a short address the Metropolitan declared that everything had happened under God's guidance. After the ceremony the procession drove briskly to the new palace, which stands quite near the old palace in which the tragedy had occurred. In the large Banqueting Hall the King met the members of the Skupshtina, and was presented by them with an address of welcome. All the servants of the former King have been retained. On the next day in the Senate house the King took the oath before the Skupshtina. His manner during the ceremony is said to have shown no little dignity. In a review of the troops after the ceremony it was remarked that he rode the white horse formerly ridden by the old King. He was greeted everywhere by shouts of enthusiasm, but there are those who maintain that a good deal of the enthusiasm was a clever stage effect and that the people are not so satisfied as they seem. At a reception given by the King only the Ministers of Austria and Russia were present. It is said that some of the other accredited representatives would acknowledge the King were it not that the old Cabinet has been preserved, which is taken as a sign that no punishment will be dealt to the assassins of Alexander and Draga. King Peter has shown already that he means to place his reliance mainly in the army. He has already issued the following proclamation:

"To My Dear Army—On setting foot on the soil of our dear Fatherland, my cradle and the cradle of my ancestors, my heart gives greeting, first to you, the hope of the Servian people, my dear, heroic army. On ascending the throne of my glorious ancestors I also take supreme command of the whole Servian Army, which, under the leadership of my immortal grandfather, by its virtues and military successes astounded the world, and, in the later war for the liberation of Servia, afforded many proofs of its military merit. I feel happy that

the supreme command has been intrusted to me.

"Officers, Noncommissioned Officers and Men: At this solemn moment I greet you with the words, 'God be with you, you falcons of the Servian people.' I am happy to see you all united around my throne, imbued with fidelity and loyalty to me and to the ideals of our Fatherland. I will endeavor to maintain this spirit by judging and estimating each and all of you solely on your military merit. You are all equally dear to me. I merely ask that you will devote yourselves heartily to the calling you have chosen, and that you will assist me to guide you in the path of honor and glory."

Russian Finance A Russian periodical of Stuttgart has published a report of the secret session of the Russian Imperial Council recently held when M. Witte, Minister of Finance, made his statement on the financial situation of the Empire. As the Russian Government has not disputed its authenticity, this document is taken to be a true report of the proceedings. M. Witte began by explaining that the expenditure of the Empire has doubled within the last ten years, and amounted now to over 2,000,000,000 rubles. The surplus revenue in the estimates of 1903 had been secured only by retaining certain indirect taxes, which had been imposed in 1900 provisionally to meet emergencies from political complications in the Far East. New forms of taxation had also been introduced. Railways owned by private companies had been bought up by the state, and the sale of spirituous liquors had also been taken over by the state. M. Witte, therefore, felt obliged to warn the Council of State that the taxation of the people, both direct and indirect, had reached the extreme limit of intensity. Further increase of the burdens would be intolerable. Means should be found gradually to reduce taxation. The first step in this direction, he thought, was to secure legislation, as drawn up by him in concert with the Minister of the Interior, for doing away with the collective responsibility of the *Mir*. New sources of local revenue must be found, even if they effected the revenue of the state, and the state must contribute to certain

expenses which had hitherto been defrayed from local revenue. The state monopoly of the sale of spirituous liquors was yielding good results, but in the revenue from the railways there had been three distinct periods. During the years from 1885 to 1894, owing to the purchase of private railways and large outlays for improvements, the treasury had to make considerable grants. During the second period, from 1895 to 1899, the deficit had been turned into a surplus by a careful system of administration. Since that time the opening to traffic of sections of the Siberian railway had reduced the surplus, and now, in 1903, there would be a deficit of 60,000,000 rubles. The development of railways for strategic purposes had been responsible for a large part of this deficit. M. Witte called attention also to the increasing expenditure of the state in other directions, notably for the army and navy. He felt certain that if the critical moment came the Czar would assert his autocratic authority in order to maintain the equilibrium of the Budget, and to compel the different Departments of the state to adjust their claims to the actual revenue of the country. He then enumerated the enormous demands that had been made on the people during the past fifteen years, and showed that any further taxation was practically impossible. The Council of State indorsed M. Witte's arguments, and decided to memorialize the Emperor in that sense.

Religious Liberty in Russia The Czar recently surprised the world with an edict insuring his subjects the blessings of religious liberty, declaring that he had "directed those in authority in religious matters to adhere strictly to the principle of religious tolerance that already finds its expression in the Fundamental Laws of Russia." The news of religious liberty in Russia seemed to be too good to be true, and just what the edict will mean practically is apparent from several paragraphs in the new criminal code, which has just been proclaimed for the Empire. Among the Special directions are the following:

§83. Whoever makes use of his public position to induce by flattery or force a member of the orthodox church to join the ranks of another religious communion shall be imprisoned up to three years in a fortress.

§89. Whoever by law or in duty bound as father or guardian to take charge of a child less than fourteen years of age, and has made use of his position to have such a child baptized according to any other rite than that of the orthodox church, or to receive the sacraments according to any other creed, this person shall be declared guilty and imprisoned up to one year.

§90. Whoever is guilty, by preaching or teaching or the publication of an essay or the publication and exposing of pictures, of inducing members of the orthodox church to join a sect or a false church, shall, if it be shown that his actions have caused this step, be punished by arrest or imprisonment up to one year.

§92. He who has in a public way made known his adherence to a Rascol [Sect] forbidden by law, shall be punished 300 roubles.

The code further threatens with fines and deposition any nonconformist minister for any but the most restricted performance of his duties. These orders are not absolutely new, but agree in substance with what has been the law in the past. And what this means can be seen by a reference to the events in the Baltic provinces several years ago, when in the interests of the Russification of these provinces those in authority found it convenient to deprive scores of Lutheran pastors of their office and to send them to Siberia for dealing spiritually with persons claimed by the state church as its own.

Agricultural Exports of Argentina

The exports of Argentina for the first quarter of the present year, as shown by the official returns of the Confederation, indicate enormous gains in comparison with the periods of 1902 and 1901. Thus in the opening quarter of the current year the cattle exported on the hoof from this fertile South American State numbered 49,752 head, as against 13,177 and 27,932, respectively, in the equivalent periods of 1902 and 1901. The increase in the exports is still more marked in the case of live sheep, 100,725 of these animals having been shipped during the first quarter

of this year. In 1902 8,982 were thus shipped, and in 1901 8,322 during the same quarter. The shipments of butter in the first quarter of 1903 were in excess of 2,000 tons, and were more than double those for the same term last year. The cheese exports of Argentina were trivial. The trade in wheat fluctuates, but the export of 656,230 tons in the first quarter of 1903 is more than treble that of the same period of 1902. A considerable amount of the increase in the export business of Argentina arises because of the re-opening of British ports to live cattle and sheep from the River Plate during the last four week. In the table which follows the only decreases are in jerked beef, wool and linseed:

AGRICULTURAL EXPORTS FROM ARGENTINA IN THE FIRST THREE MONTHS OF 1901, 1902 AND 1903.

	1901.	1902.	1903.
	Head.	Head.	Head.
Live cattle.....	27,932	13,177	49,752
Live sheep.....	8,322	8,982	100,725
	Tons.	Tons.	Tons.
Frozen mutton....	16,985	14,116	20,008
Frozen beef.....	8,271	11,831	15,397
Jerked beef.....	2,401	7,693	4,040
Wool	68,460	103,518	92,431
	Pounds.	Pounds.	Pounds.
Butter	1,133,580	2,138,400	4,452,800
Cheese	1,461	662	7,192
	Tons.	Tons.	Tons.
Wheat	339,745	201,745	656,230
Maize	58,872	33,676	59,099
Linseed	246,469	246,129	231,589
Hay	15,581	27,799	40,749

Germany The official returns show that at the German general elections the Social Democrats cast 2,911,317 votes, an increase of 800,000 over 1898. At the reballotings, which were held on June 25th, strenuous efforts were made to keep down the Socialist vote, but they succeeded in returning a number of candidates. The *Lokal Anzeiger* tabulates the changes in the new Reichstag as follows: The Socialists gain twenty-three seats, the Conservatives one, the Poles two, the Hanoverians two, and the Independents one, while the National Liberals lose one seat, the Free Conservatives one, the Clericals six, the Richter Radicals seven, the Barth Radicals six, the South German Radicals and the Anti-Semites three, the Agrarian League four, and the Alsations one.

The Final Outcome of the Declaration of Independence

By Hayne Davis

MR. JAMES BRYCE has said that American institutions disclose the type toward which all the rest of civilized mankind are forced to move, some with swifter, some with slower, but all with unresting feet. This is no mere fancy, but a fact. Witness the birth in America alone of one hundred and eighteen States like those which compose our Union since the Declaration of Independence. There was not one such State in existence before that Declaration was made, and their birth rate since in America alone has been nearly one a year. They have grouped themselves into nineteen absolute Sovereignities, maintaining diplomatic relations with the nations of the world; and all that have territory enough to justify it have taken the same federal form as the United States. Both Canada and Australia, tho still within the shadowy boundary of the British Empire, are really nations formed in the likeness of the United States.

The forces which have done these things in other parts of the world are at work on the Continent of Europe. Already they have formed there, out of petty kingdoms that were at war *inter sese* for centuries, the German Empire and the United Kingdom of Italy, structurally in the likeness of the United States. Already, too, some of the offices of these governments have been won for the American principle—namely, periodical choice by cotemporaries instead of hereditary selection of officers of government.

In all Europe war is being waged between the Home Rule Form and the Elective principle of government on the one side and Imperialism and the hereditary right to rule on the other, and the victory is continually for the American idea. In this Americanization of the world America's part is simply to let her light so shine, by wise conduct of her own home affairs, that other nations may see

her good works and adopt the political principle which has been her source of power.

But the fashioning of various parts of the world into the likeness of the United States is only a part of the political world work of the future. During the past century men have discovered, and applied to business affairs, scientific truths which will make the world's nations nearer neighbors to each other than any of the States now constituting these unions were when their unification began. All the forces which operated to unite the American States during the past century are operating now to unite nations in the same form. Not only this, but new and powerful forces have been added, and the whole system of forces has been intensified by the electric flash, annihilating time and distance, making men's interests as wide as the world and their communications as quick as lightning. If union of contiguous States could not be resisted under nineteenth century conditions, how can union of nations be resisted under these conditions?

The startling fact is, however, that the United Nations has already come into being through The Hague Conference.

Before The Hague Conference convened international affairs were in chaos. That conference turned chaos into something better than Confusion, tho hardly worthy to be called Order. The highest ideal which could win the unanimous approval of the Conference was an International Court to which every nation might appoint four members and which should always be open for the trial of any international question voluntarily submitted to it, but should have no power to summon any nation to come before it in any matter whatsoever.

As twenty-six nations have ratified the Treaty of The Hague, providing for such a court, and have appointed members to it, the Judicial Department of the

United Nations has been duly organized and in good form. Even tho this Court of the United Nations is without suitable authority, its very existence constitutes the United Nations a living organism. It is feeble, but it is alive. Its life is endangered to be sure by the passions of men and races, but the forces which gave it existence will preserve and strengthen it, and it will live as long as human government endures, because it is organized in the Republican form (Home Rule) and operated on the Democratic principle (periodical choice of officers by their cotemporaries).

The United Nations seems now to have only a Judicial Department, but every living political organism has three departments—Legislative, , Judicial and Executive. It is easier to see them when divided and put into the hands of three separate persons or three distinct bodies than when they are concentrated in one person or scattered among many. In the United Nations as now constituted there are twenty-six legislative bodies—law making authorities of each constituent nation. No idea can become a binding law for this union until it receives the express or implied approval of every one of these bodies. There are twenty-seven judiciaries in the United Nations whose jurisdictions conflict. First, The Hague Court, which can judge in such causes only as are voluntarily submitted to it by both disputants and whose judgment may be disregarded by break of faith; and the twenty-six Executive and Legislative Departments of the constituent nations, the right to judge its own cause having been reserved to every nation when the union was formed. And in judging its own cause a nation acts necessarily through its legislative or executive, not through its judiciary, tho judgment properly belongs to the latter.

Whether a particular controversy be judged by the nations involved or by The Hague Court, the enforcement of the judgment is in the hands of the Executive and Legislative departments of the constituent nations. So that there are twenty-six executive authorities in the United Nations.

This is a chaotic system to which the interests common to all men are intrusted, and yet it is a system. It is not hopeless

confusion, but struggling order. Existing nations have come out of a similar condition—England out of almost this identical one. And America has handed over to the twentieth century two documents which contain all the words necessary for preserving the life and perfecting the form of this political child of our century—the Articles of Confederation and the Constitution of the United States.

It would seem as if the destiny of this government of the future is to grow into the grace, first, of the Articles of Confederation, and then of the Constitution of the United States.

The United Nations now have one grace not possessed by the United States under the Articles of Confederation (1776-1789) or under the Constitution of the United States as originally adopted.

First, it is provided in the Constitution of the United Nations—the Treaty of The Hague—that any nation may secede at will from the union thus created by giving one year's notice of its intention. The absence of a clause on this subject caused the Civil War and almost wrecked the American Union.

Second, the Articles of Confederation required the submission of all disputes between States to the judgment of Arbitrators of the United States, and created a deliberative body having Representatives from and chosen by each State, and empowered to legislate on certain matters agreed to be of common concern to all the States.

When the International Parliament corresponding to this Continental Congress of the American Confederation comes into existence, shall it be empowered to enact laws for the United Nations on specified subjects? If so, should this be by unanimous vote, or three-fourths vote, or two-thirds vote, plus one (which was the provision in the American Confederation)? Or should this body merely originate amendments to the Law of Nations, its resolutions to become binding when ratified by a specified number of nations, or when not vetoed by a specified number?

What international questions ought now to be put into the list of cases triable only by the Court of the United Nations?

Would it be wise for nations to enter into an agreement to submit all controversies to arbitration in the first instance, with the right reserved of appealing to arms after the decision of the court if the people cannot abide the decision? These questions present the paramount political problem of the immediate future.

As the American people could rest only one decade under the Articles of Confederation, it is reasonable to suppose that the people of the world, after having realized what seems to be its grace, will soon grow out of its deformity into the symmetry of the United States as now constituted.

There are difficulties in perfecting a world-wide organism not encountered in the creation of the United States, which covers only a part of one continent, tho including in its citizenship men of every race. The differences of condition must express themselves in the Constitution of the World Union; for instance, the United States is forbidden to interfere in domestic difficulties within a State unless called on by the Legislature of that State, and is bound to help if called on, and to preserve forever the Republican form of government in each State. This was a proper provision in forming the United States, for all the States had reached the final form of government—Republics. In the United Nations some members are republics, some quasi-republics, some quasi-monarchies and some absolute monarchies. Republics can unite with such Governments for affairs common to all, if a Government for these affairs can be agreed upon which is acceptable to all the nations concerned; for the basis of an international union must be Home Rule, which entitles the people of every nation to have such government for their home affairs as seems to *them* most likely to affect their safety and happiness. Hence the United Nations will have to guarantee to the people of each nation the right to grow out of its present deformity into more perfect political symmetry when and as its people prefer, binding itself not to interfere under any circumstances in the domestic difficulties of any constituent nation.

It might be well to leave each nation free to levy a tariff on imports, for there is no tariff policy always best at all

times for all nations. And if there were, it would not be possible for all nations simultaneously to discover this fact. If the Parliament of nations should enact a uniform tariff law for practically the whole world, it would surely postpone the day of its coming into being, and might cause some nations eventually to secede. Ultimately, international trade and intercourse would be as free as interstate commerce now is. But this had better come by independent action of the various National Legislatures, just as the freedom of speech, of conscience and of the press throughout our Union has come by the separate action of forty-five State Legislatures, not by concerted action of their Representatives in the Federal Congress.

With these exceptions few material changes need be made in the American Constitution to turn it into a World Constitution. The grant of positive power to the larger organism should be an exact counterpart of the grant of power from the States to the United States. All political power was reserved to the States, or to the people, except power to control commerce* between the States and with foreign nations. These two, and only these two, powers were granted to our Union because all other political matters were considered as local to the States. Just so the United States should reserve control of commerce between its own States and grant to the United Nations authority to control international commerce, this being the one political matter of common concern to all nations.

Not only the positive grant of power to the United States but the essential limitations on its authority are proper in the Constitution of the United Nations—*i. e.*, the United Nations should be forbidden (1) to establish a religion, (2) or to require any religious test for holding office, (3) or to abridge the freedom of conscience, or of speech, or of the press, (4) or to interfere in the

* The word "commerce," as used in the Constitution of the United States, is construed by the Supreme Court to include intercourse of all kinds as well as trade. The power to make treaties of commerce, to declare war, to make treaties of peace, is really a part of the power to control intercourse and commerce with foreign nations.

domestic disturbances within any nation, etc.

Each nation should have a voice in the United Nations—an equal voice in the Senate, a voice in the House proportionate to population (or, say, international trade) and a blending of these two in the choice of the chief executive, if it be found that a chief executive be needed.

As to suffrage and holding office under the United Nations, a person entitled to express his opinion in the conduct of his State and nation would hear his voice re-echo in the councils of the United Nations; and any one eligible to office in his own nation would be eligible to office in the United Nations.

When the United Nations assumes the form of the United States this will give to every man a trinity of political authorities.

First, most important and forever most dear to the heart of man, his own immediate State or political neighborhood, which, by becoming a part of the United Nations, would become supreme forever in its own affairs at home.

Second, his nation, guaranteed in its perpetual control of commerce between the States which compose it and in the right of its people to organize it, or re-organize it, in such form as they may prefer.

Last, the United Nations, greatest in area and yet least important, but nevertheless absolutely essential to secure to any man those blessings for which his State and nation have been organized by such expenditure of blood and treasure.

After the perfection of this Union the authority of the Legislature of New York, Saxony or any other State within a nation would be exactly the same as now. The Congress of the United States, or the Parliament of any other constituent nation, would have every perfect power it now has, for nothing would have been taken away except the right to say in international affairs. And as the Legislature of every nation now has an equal right to say in such affairs and therefore contradict what any of the others say, and by so doing

cause war, it is plain that no nation has a perfect or desirable voice in the interests common to all nations. Consequently the people of every nation would have a more perfect as well as a juster voice in their widest interests if they expressed themselves in an International Parliament instead of through their own National Legislature or Executive.

Passing from consideration of its form to the reason for perfecting and perpetuating it, this Union would substitute safety for danger at home, profit for loss everywhere. It would turn the present terminable privilege of trading throughout the world at a present loss in money and an almost sure calamity of war in the near future into an abiding right of profitable intercourse between all nations, and the present universal danger of destruction into security for the enjoyment of the fruits of labor wherever harvested.

Everybody's interest would be conserved, no man's interest jeopardized, and the gravest menace to the peace of the nations dissipated. Extermination of nations, massacre of men in war, devastation of lands and of the treasures of ages, and all the horrors which inevitably accompany these things, would be at an end.

But mere agreements to arbitrate international differences cannot bring war to an end. The American people made such an agreement when forming the Confederation; then they went further and formed the Union, and yet war between the States came. American history teaches that organization on the Home Rule basis, clearly defining the rights of the several political organisms, and scrupulous respect for the rights of the smaller by the larger bodies, are all essential to the preservation of the peace and welfare of the most intimate Sovereignties. Lincoln truly said: "Nothing is settled till it is settled right." And as man, no matter what his color, or convictions, or habits of life, is entitled to Home Rule—a due voice in all that concerns him—revolutions within governments and wars between nations must continue until the world settles down to peace and plenty under a universal Republic which shall secure to all men

their inalienable right of Local Self-Government.

It was Victor Hugo who exclaimed:

"The Republic is the Future"

The Republic is the political device for effectuating the right of all to have a due voice in everything that concerns them—the Present liberated from the Past, the Here from the Yonder—such a Government is the Republic and such a Republic, covering the whole world, is the Future.

The greatest obstacle to the immediate perfection of this Union is not in the nature of things, but in the prevailing misjudgment of each other by individuals and races. To Jews other races seem still too much like Gentiles—unworthy of the promises. To those hav-

ing the spirit of the Greeks, others still appear to be Barbarians; to Royalists, the mass of mankind seem unworthy of taking a part in the higher things; to those who pride themselves on nobility, the rest of humanity seems ignoble. But to the man who has risen really high, other men appear as they really are—capable of sharing in his noblest thoughts and aspirations, which are indeed already smoldering in them and ready to be fired by the vital word when truly spoken.

Finally, to regard the formation of this United Nations as a fancy is to ignore the fact that it has already been formed. To look upon its final perfection in the likeness of the United States as visionary is to ignore the essential political history of the nineteenth century.

NEW YORK CITY.

The Personality of Theodore Roosevelt

By William Garrott Brown

AUTHOR OF "THE LOWER SOUTH IN AMERICAN HISTORY," AND LECTURER AT HARVARD UNIVERSITY

THE figure of Theodore Roosevelt is at present one of the two or three most conspicuous in the world. The Emperor of Germany and Joseph Chamberlain in England are the two contemporaries with whom it seems most natural to compare him. Of all Americans, he is the man whom his countrymen hear about and talk about the most.

For the reason that we have him so often in our thought, the influence which he has on our individual lives is probably stronger for the time being than that of any other personality among us. It is doubtful if any power he has over us through his office or through his leadership of a party is so great as this which he exercises directly through his example and his character. Many years must pass before any public act or policy of his will touch so many lives as he now daily reaches by reason of the knowledge which we all have of him. For most of us, when we consider a course of conduct or try to judge ourselves, are in the habit of bringing up for comparison

some other man well known to us for strength or virtue or success, and asking ourselves how he would demean himself if he were in our case. Nowadays, I fancy, more of us think of the young President at such times than of any one else.

Our opinion of him is, therefore, a very practical matter. To us, his contemporaries, it is scarcely less important to decide what sort of man he is than to judge his official course aright. We are of many minds concerning him, but that is not to be wondered at. It is seldom that even in a group of intimate friends any two will agree completely about a third. When we try to agree about a public man countless prejudices and partialities are aroused which make it still more difficult to reconcile our differing ideals and standards. Another difficulty is that we do not all have in mind the same facts when we discuss his career. To go over the main facts simply and briefly, so that they make a single impression, is a good way to be instructed.

Roosevelt was well born. From a

mixed ancestry he inherited the strong characteristics of several racial strains, and a tradition of honorable and successful living. He also inherited a sufficient patrimony to make him the master of his own time. The disadvantages with which he began were feebleness of body and poor eyesight. While he was a boy his intellectual power was thought to be solid, but not brilliant. He was carefully reared in a home where the life was cheerful and wholesome. Both at school and at college he had the training which is commonly supposed to be the best anywhere offered to American youth; to this there was added foreign travel and special training for the bar. On the whole, he was fortunate far beyond the common lot in respect of what came to him at his birth and the way he entered upon life.

What may properly be called his own work began with the strengthening of his body. Before he came of age he had by exercise and self restraint made himself a good athlete; but it can scarcely be believed that his extraordinary capacity for hard work both of the mind and of the body is entirely acquired. He has remained short-sighted, but with glasses his eyes have been proved to be good enough for much reading and writing and for excellent marksmanship. He was not less resolute in making his mind ready for its uses than he was with his body. A good student of books, he employed many other means to acquire knowledge, and had won before he left his university a valuable reputation for energy and self-reliance.

Before his law studies were finished he had turned to the two pursuits which he has followed ever since—politics and letters. His first book was written when he was twenty-three, and by his thirtieth year he had written enough to give him a good place among American historians and biographers. Of his literary work, as a whole, perhaps a fair judgment is that in quantity it surpasses, while in quality it at least equals, the work of other men who for a longer time have made the same subjects their principal occupation.

But he himself has had many other occupations. At twenty-four he entered the New York Legislature, a Republican, but an avowed reformer. He had begun

politics by associating himself with a group of young men in New York City bent on various reforms, among them the reform of the tariff laws. To one of these friends he wrote later that he was a Republican first, a free trader afterward. It is generally agreed that in the Legislature he was an energetic and in the main successful champion of good causes, sometimes against his fellow Republicans. Nevertheless, by the time he was twenty-five he was strong enough in his party to lead in the State convention of 1884 a successful opposition to Blaine, whom he distrusted. But when Blaine was nominated Roosevelt refused to join in the independent movement of that year, and he has never since shown a disposition to leave his party.

During these early years he was also winning in the far West the reputation of a good frontiersman and huntsman. At twenty-eight he was the candidate of the Republicans for Mayor of New York City. Since his thirtieth year he has been in office practically all the time. As Civil Service Commissioner for six years and in other offices, and as a citizen, he has given exceptionally good service to the cause of civil service reform. The testimony of such a man as Jacob A. Riis does not permit us to doubt that at the head of the police commission of New York he in two years accomplished an extraordinary amount of work. For a year before the outbreak of the Spanish War he was Assistant Secretary of the Navy, and he is generally accredited with the lion's share of the work of making the Navy ready for the conflict; but when the war came he left his post at once to raise a regiment of volunteer cavalry. His valor in action is not doubted; but his discretion as an officer has been questioned. Prominent in what there was of fighting, he made himself equally prominent by heading a protest against leaving the army to suffer from disease in a tropical climate when the fighting was over. Being now widely celebrated, he was at once nominated and elected Governor of New York. It seems to be agreed that as Governor he promoted many administrative reforms, made good appointments, and showed considerable independence; but by some he was blamed because he did not break alto-

gether with the extraordinarily absolute leader of his party in the State. However, it has not been shown that he surrendered any principle he had ever plainly declared.

In 1900, being pressed to become the Republican candidate for Vice-President, he said he would not; but he yielded to the clamor of the National Convention. When, through the death of McKinley, he was elevated to the first place he announced that he would adhere to his predecessor's policies. This he has done, and behaved as a consistent Republican on all questions involving that view of the Government which the party has generally maintained. But his administration is distinguished by the extension of the merit system of appointments and by two departures that seem to be new. By interfering actively to make an end of a great strike and by securing the enforcement of a law, hitherto ineffective, in restraint of trusts, the President has indicated his feeling that the Government ought to deal more aggressively with the new conditions which industrial changes have brought about. By his appointments to public offices in the South, and particularly by opposing the movement there to keep the negroes out of office and even out of the Republican party, he has brought the Southern question into a new and difficult phase. His initiative and control in legislation are not thought too great.

When it is remembered that along with these performances in politics and literature and war Roosevelt has found time for countless other activities not without interest to the public, and that his domestic life has been filled with all the responsibilities that come to the husband and the father, his actual achievement is impressive. It seems to make good the claim which he himself advanced for the age we live in—that life was never before “so full of interest and of possibilities of excitement and enjoyment.” Of life considered thus as opportunity he has made better use perhaps than any other American of his generation. He has done more than any other, and of what he has done, most is approved by those standards which the ordinary morality of the race accepts. So far, therefore, as our opinion of the man is

determined by his work in life, the question is not of his success; it is, rather, whether he has not been too uniformly successful. For experience has brought many of us to feel that constant success implies constant compromise, and that sometimes it is more admirable to fail than to make any compromise whatsoever.

On this point, however, it must be said that Roosevelt's course squares with his avowed morality. His writings and speeches are full of the doctrine that to strive for the best possible, and never to rest in failure, is the right way to live. Apart from the bent of his nature toward action, he has taken that view of life which tends the most strongly to achievement. It is his nature to do things as in this world they must be done; and that is also his creed.

We must give him, therefore, without stint the praise of strength. To those of us whose fault is mere weakness the thought of him is like a scourge. Nor can many of us honestly believe of him that he has done more than we have because he has cared less to be right. Here and there are things known to us in his life which a nice casuistry might permit us to condemn—such things as his abandonment of free trade at the outset and his leaving his post in the Navy Department, where he knew that he was doing good service, to go into the field, where he could not well be sure that he could do better than another. In general, it is hard to believe that it was every time the rightest course to accept the opportunity or the preferment which came to him. But who of us that have done nothing can say honestly that of the opportunities he has missed a tithe were missed from any fear of doing wrong? Granted that this young American's ideals of conduct have not been so unfortunately high as some of ours, how many of us can say that we have stuck to ours half so stedfastly as he has stuck to his? However bitterly some of us may oppose his course, say in the matter of holding the Philippines by force, we cannot, on the facts of his career as we know them, deny that it has been as consistent as public careers usually are. On the contrary, if we compare him in this respect with his fellows in public

life, we shall probably be driven to decide that he has been controlled, oftener than the great mass of them, by his sense of right. Fortune has favored him, but we must go beyond the accepted law of the struggle if we would object to his having the highest place.

We should probably find better reason to be discontented with our foremost American if we should consider those elements of his character which have the least to do with the struggle. Many of us feel, I think, that for all this strength in the figure which we are so often called to gaze upon there is too little compensating grace. We find in Roosevelt's youth more of lustiness than of sweetness, in his manhood more of power than of stateliness. The entire spectacle of his life is not at all like that which the Greeks had in the life of Alcibiades, but neither is it like that which the English had in Sir Philip Sidney's. It is a spectacle which draws our spirits forth to work and adventure, but does not inspire us with any finer sympathies.

This, perhaps, is all we should expect of a man of action. But we cannot help remembering—and has not he himself taught us to demand for our own age all that the best of former ages have known?—that there have been great men of action, conquerors and deliverers and builders of states, who wrote their strength above a woman's tenderness, an artist's sensibility, whose career stirred their contemporaries to other things besides achievement. We call to mind the Charlemagnes and Alfreds. But we need not go so far back in time, or out of our own history, to find in the careers of men of action a quality which Roosevelt lacks. We shall find such a quality in Lincoln, and in more than one other of our earlier American public men. We shall find it in men of the old fashioned broadcloth coats and the high-flown eloquence and the provincial dignity, which seem to be disappearing along with the white houses with green blinds. It is not merely in his dress and bearing and his mode of speech that Roosevelt is unlike those men whom his immediate predecessors in many respects resembled. He has brought into the higher walks of public life characteristics which city breeding

and wealth and universities and foreign travel have in recent years made not uncommon in America, particularly in our Eastern States, but which to a great part of our population are still novel and not altogether acceptable. The effect of it all is a little like that which the coming of city folk in summer time has upon a rural community. Hitherto whatever form and grace have come into our public life have come from the New England village, the country town, the Southern plantation. In this new manner there is more of the great city and of the college football field. As yet it is not easy for us to find the new so good as the old. In Roosevelt himself there is less of the poetical, the dreamy, the reverent than there has been in others, even of our American men of action.

Taken thus as an example, an influence on character, his career might also profitably be contrasted with others which have not been in the ordinary sense active careers at all. No better opposite could be found than the life which so many thoughtful Americans have recently been reviewing. Roosevelt, at the head of his extraordinary regiment, storming the last stronghold of that civilization which for centuries has been offering a lessening competition to our mastery of the Western world, and Emerson at his desk in quiet Concord, with "the three domestic women," who were all he commanded, in the background, writing down but a "fragmentary result" of his meditation, show us two very unlike ways to eminence. Few will believe that at the middle of this century Roosevelt will still be a personal force such as Emerson is to-day, a century from his birth. Cuba and the Philippines and the Isthmian canal and laws and precedents will perhaps speak for him. But no words of his are likely to live as Emerson's "repellent particles" of sentences have lived. Power spiritualized outlasts power incarnate.

Power made definitely effective, immediate performance, practical results—these, I think, are the main things in Roosevelt's example. The effect on American character of his elevation to so high a place before our eyes can scarcely fail to be a still stronger emphasis on achievement. It is, on the whole, a good

lesson, but not perhaps the lesson which Americans of this time are most in need of. Idleness and incompetence are not the most prevalent of our faults, nor are we particularly lacking in regard for force. It will probably seem to posterity that Roosevelt was in this respect representative of his time rather than a creator of new national ideals. American ideals will probably seem to have changed simultaneously with his rise; and many think that American character also is rapidly changing. An elderly Cuban remarked after an interview with a philanthropic educator, whose work on the is-

land did not commend itself to the military authority then in control: "That time I felt as if I were dealing with an American of forty years ago." But Roosevelt has probably not contributed so much to these changes as they have contributed to his good fortune. It is hard to believe that energy and persistence and courage like his could have been kept down in any former period; but he is right in his contention that the present time offers to such a man as he better opportunities than he would ever have found before.

CAMBRIDGE, MASS.

The Year's Progress in Peace

By John W. Foster

EX-SECRETARY OF STATE

HAVING been requested by THE INDEPENDENT to contribute to its Fourth of July number, I have thought it appropriate to furnish a review of the events of the past year respecting arbitration. In no aspect of our international relations has our country been more distinguished than in its attitude on this subject. In our exultation on the return of our national anniversary we should not forget that some of our most glorious victories have been those of peace. Ours is not a military Government, and let us so shape its policy with other nations that it may never become such.

It is a matter of congratulation for us that the United States was the first to set an example to the world of a resort to The Hague Tribunal. It was announced a year ago that this country and Mexico were just concluding an agreement to submit to that international court a question much discussed and of long standing. That case has already been submitted to the Tribunal, and with a promptness and celerity almost unknown in international judicatures a decision has been rendered. Altho the amount of the award is large, the debtor nation has cheerfully accepted the result.

Even for her the result was so much more satisfactory than the constant irritation growing out of the continued agitation of the question that it was better to pay the award, even tho regarded as inequitable, and be at peace with her neighbor.

Probably the most edifying and auspicious event has occurred in a quarter of the world to which Anglo-Saxons have not been inclined to look for helpful examples in good government and salutary public law. In the lower extreme of the South American continent there have arisen during the last century two prosperous and aspiring republics. As a rule they have sustained good administration, maintained excellent foreign credit, and have greatly advanced in wealth and resources. For a time they arrayed themselves in a rivalry for supremacy on that continent, and following the example of the greater nations they largely increased their armies and navies. A controversy over a boundary line threatened to light the torch of war and thrust these two peaceful, prosperous and industrious peoples into a sanguinary and exhausting conflict. But better counsels prevailed, and Chile and Argentina agreed to submit the bound-

any question to the arbitration of the King of England. His award has been rendered and accepted by both nations.

But that is only the beginning of the narrative. The two nations have entered into a treaty whereby they agree to submit all questions which cannot be settled by diplomacy to arbitration, the only exception being those involving principles of their constitutions. They further agreed to stop the construction of more naval vessels and to sell those which were ordered at the time the war fever was raging, and as a result there are now in the naval dockyards of Europe several war vessels of the two nations seeking customers. They also agreed to reduce their armies to a peace footing and to so maintain them, and to partially disarm their naval vessels at home.

As a result of this disarmament we are informed by recent press news from Buenos Aires that the Minister of Marine has tendered to the Minister of Agriculture two of his unoccupied men-of-war to transport grain and meat products to South Africa, where the Government is seeking to open up a new market for their superabundant harvests. With a slight change in the Biblical metaphor, may we regard this as the beginning of that millennium era, foretold by the ancient prophet, when the people "shall beat their swords into plowshares and their spears into pruning-hooks; nation shall not lift up a sword against nation, neither shall they learn war any more"?

From these far away countries, where we have been so prone to expect war and disorder, comes this inspiring and hopeful example. They are a people, too, of a different religion and race from the most of us—Catholics, not Protestants—Spanish Americans of the Latin race, not the boastful Anglo-Saxon. May we not learn from this to be a little more charitable in our criticism of the countries to the South of us in their struggles to free themselves from the customs which enchain them during so many centuries of misrule?

Some notice must be taken of the Venezuela complication. Three of the most powerful nations of the world combined in a hostile demonstration against one of the feeblest of the smaller nations.

The alleged cause of this combined armed expedition was one for which neither of them, nor all three combined, would have had the temerity to make war against any nation with even moderate military resources. When in 1861 the United States was solicited by three of the great nations of Europe to unite with them in an armed demonstration against Mexico for a similar reason, Secretary Seward replied that our Government was not disposed to enter upon warlike measures to enforce claims against a friendly Power. Such a reason for hostilities has certainly not gained in strength with the lapse of half a century of enlightenment. The point which I wish to emphasize is that the public sentiment of the world, and especially of the British people, brought those three powerful nations to a halt. It is encouraging to know that in this era it is not so easy to inaugurate or prosecute an unjust war as it was a century or more ago.

On the other hand, the event shows some of the evil effects of transforming the populous nations into great military Powers. While the vast naval armaments and standing armies of Great Britain, France, Germany, Russia and other nations make them very cautious about provoking each other to a conflict, they offer a temptation to occupy these forces in expeditions and adventures against weaker nations. There was little risk to Germany, Great Britain and Italy in seizing or sinking the infantile flotilla of Venezuela and in bombarding its antiquated forts. Hence, in the interest of the weaker nations and of the world's peace, it is of the utmost importance that a public sentiment be created among the enlightened nations which will restrain the great military Powers from entering upon schemes of adventure or oppression and which will support the smaller independent nations in their appeal to the arbitration of their differences with the more powerful.

In this connection it is gratifying to us as Americans to note the attitude of our Government in the existing controversy of the European nations with China. After they, by their territorial aggressions upon that empire, had provoked its people to rise in blind resent-

ment against foreigners, and then punished them by the levy of an enormous indemnity, they insisted with this helpless nation upon the exaction of the last "pound of flesh" by a technical construction of the protocol, which made it annually more and more difficult for the empire to comply with its terms. It was a generous and magnanimous act on the part of Secretary Hay to construe the protocol most favorably for China, and heartily to support that Government in its appeal for submission of the question in dispute to The Hague Tribunal. How it would exalt the Christian nations in the eyes of those whom we style the heathen if this appeal should be granted!

The Venezuela embroglio has also served to bring into prominence the value of arbitration and the utility of The Hague Tribunal. It was a high compliment to President Roosevelt to be solicited to act as arbitrator of that dispute. But it enhanced his reputation still more to decline the offer and to refer the contending parties to the Tribunal which his own Government has done so much to create.

In no country did this act of President Roosevelt receive greater commendation than in France, some of whose representatives at The Hague Conference were the most ardent supporters of the scheme adopted by that body. Only a few days ago the press announced that the Parliamentary arbitration organization of Senators had received some notable accessions from the ranks of its public men, and that the cause of international arbitration had been given a new impetus in that enlightened country.

Not the least of the events of the past year tending to peace is the treaty between the Governments of the United States and Great Britain to refer the controverted question of the Alaskan boundary to a mixed tribunal of American and British jurists. It is not an arbitration, and, from the state of the question and of public sentiment in the United States, it could not well be such. It is an illustration of the fact that even so excellent a principle as arbitration has its limitations in practice. It was not possible to have secured a treaty to entrust the settlement of the Alaskan boundary to the

award of a neutral foreign arbitrator. It may sound strange to be told that some of the most earnest advocates of The Hague Tribunal were strongly opposed to the Alaskan boundary treaty. But I regard it as a wise measure and one which redounds to the credit of President Roosevelt and Secretary Hay. It provides a safe method of adjusting a long pending and vexed question, which threatened to disturb the relations of neighbors who ought to be the closest friends; and I entertain the confident expectation that the six distinguished jurists to whom the matter is referred will find a solution honorable to both parties.

Should it have this greatly to be desired outcome, it cannot fail to increase the prospects of a permanent arbitration treaty between the United States and Great Britain. It will be remembered that six years ago Secretary Olney and Lord Pauncefote signed a general arbitration convention to continue for five years only, but it failed to receive the approval of the Senate largely because of this boundary dispute. The Alaskan boundary treaty, approved by the Senate last February, is the method of settlement provided in the Olney-Pauncefote convention. If it shall prove effective we may have renewed hope of seeing at no distant day a general arbitration treaty between these two kindred peoples, who have a common heritage and a common mission in the world. It must not be that the twin Latin Republics of South America shall put us to very shame when we are claiming to hold aloft as a model for all peoples our much vaunted Anglo-Saxon Christian civilization. We should concentrate our efforts in favor of a general arbitration treaty between the American and British Governments on the lines of the unratified convention of 1897. To this end public sentiment should be brought to bear upon the Senate of the United States. That distinguished body is a fair representation of the American people, and when the latter shall express themselves as favorable to such a treaty the Senate will ratify their verdict. Let all lovers of peace and of their country concentrate their efforts to bring about that greatly desired result.

Independence Day

By Edward Everett Hale, D.D.

WHAT has the country gained and what has it lost in a hundred years? A hundred years ago the Fourth of July had already asserted its place as a national holiday. There were Fourth of July orations and Fourth of July fireworks, and the day was called Independence Day a great deal more than now. Royall Tyler had already written the song which perhaps is still remembered by some of the older readers of these lines:

"Squeak the fife, and beat the drum,
Independence Day is come!
Let the roasting pig be bled,
Quick, twist off the cockerel's head."

Thirty years later than that, as a school boy, I used to crunch Independence Biscuits. Independence Biscuits were oblong in shape, and they were made as the Boston substitute for Prince Regent's Biscuits. If you were an Anglo-maniac you could buy Prince Regent's Biscuits, but they were round. If you were a true American you bought Independence Biscuits, which, as I say, had four right angles. I wish anybody could tell me where I could buy as good biscuits now.

John Adams's words in his familiar letter to his wife had been verified and more than verified:

"I am apt to believe that it will be celebrated by succeeding generations as the great anniversary festival. It ought to be commemorated, as the day of deliverance, by solemn acts of devotion to God Almighty. It ought to be solemnized with pomp and parade, with shows, games, sports, guns, bells, bonfires and illuminations, from one end of this continent to the other, from this time forward, forevermore.

"You will think me transported with enthusiasm, but I am not. I am well aware of the toil, and blood and treasure that it will cost us to maintain this declaration, and support and defend these States. Yet, through all the gloom, I can see the rays of ravishing light and glory. I can see that the end is more than worth all the means, and that posterity will triumph in that day's transaction, even altho we should rue it, which I trust in God we shall not."

Mr. Webster uses the same words in his reproduction of the speech which he supposes John Adams made, in Independence Hall in the Continental Congress.

Since the year 1800, in the century which has just passed, the nation has gained the sense that it is a nation. In 1800 the old State's Rights men were still living. Such men as Samuel Adams in Massachusetts and Thomas Jefferson in Virginia were trying to persuade themselves that the United States are a Confederacy. But the most foolish boy who fires a cracker in the street to-night knows that the United States *is* a nation. The Government at Washington, the cyclopedias, even the newspapers, have come round to print the word *is* instead of the word *are* when they speak of the United States.

Here is a nation, and the country knows that it is a nation. It required a war, a sad and wretched war of four years, to teach this to the country. But the true statesmen had known it before. John Marshall and John Adams had known it. George Washington had known it. Benjamin Franklin had known it. Daniel Webster had known it. And every one who set his face against the reality which the word nation expresses was swept under and is destined to be forgotten.

This is the first thing the country has gained. It is so great a thing that the people of this country do not understand now how great it is. But the great tide of emigration into America does something to help. The Pole, or the Bohemian, or the Mesopotamian, or the man from the parts of Africa round Cyrene, who lands at New York to-morrow does not know that he is coming to live in Massachusetts or in Illinois or North Dakota. He only knows that he is coming to America, and that is all he cares for.

When my brother Charles represented our Government in Egypt he

told me that if he went to the railway station to go from Alexandria to Cairo the finest car in the Khedive's service was run out for him. The officials paid every attention to him, such as they could not have exceeded if his were a crowned head; and they did this because he represented America. The humblest fellah in Egypt, he said to me, associates America with the idea of freedom, and if he can pay court to the representative of America he thinks he has scored one in his life of the year. This is what the nation gained as a hundred years went by.

In an Asiatic port, half a century ago, the captain of an Austrian vessel undertook to impress as a seaman a man who was an Austrian by birth. But he had become an American citizen by naturalization. An American frigate was in the same harbor, and the commander of the frigate sent word to the Austrian that if the man were not sent back to him in half an hour he would open his batteries and sink him.

The man was returned. An incident like that is repeated from one end of Asia and from one end of Africa to the other. The United States is a nation, and the United States takes care of her humblest citizens.

So is it that in the celebration of to-day men will join who are glad that they are under a flag which represents a nation. There will be men who join in that celebration who do not know whether they live in Massachusetts or in Connecticut or in Rhode Island, but they will thank God that there is a nation which will give to them rights equal with those of its own son, if only they will assume the duties of citizens while they claim the privileges of citizens.

This is a great deal to have gained.

On the other hand, we have lost the freshness of a beginning. I have my father's address when he left Williams College in 1804. No boy graduate in this July could speak more bravely or more loyally than he does of the future of the country, of the power it is to have among the nations of the world. Is there not something magnificent in this forelook of the boys and men of that time? It drove the foreign travelers

mad. To toil over miserable mud roads for hours, to stop for the night and beg a lodging at a log cabin, and then to have the owner of that cabin tell you in the morning that America was to take the lead of Europe—that this very desert where he lived, perhaps, was to be the center of the civilization of the world, would provoke a German, or a French, or an English traveler so that he could hardly speak his rage. Yet they all, every man, every woman, every boy and every girl, talked in that fashion. They discounted the future. They knew that all power was theirs. Freedom! That was theirs, and on Freedom everything would follow.

It is refreshing to read of such charming enthusiasm after some "bishop, or squire, or knight of a shire" has told you in 1903 that we are going to the dogs, that Freedom only means licentiousness, that we no longer live to the glory of God, and that we live for our own pockets, for our own dividends, A by himself, A.

It seems to me that such people might be better employed.

Cardinal Gibbons, in a very interesting paper on "Patriotism and Politics," gives a brief outline of what appears to him the most efficient means to perpetuate our political independence. They are, first, stringent laws regarding the ballot. Second, an enlightened judiciary. Third, a fearless press. Fourth, incorporating into the school system familiar lessons on the history of the country. Fifth, a more hearty celebration of our national holidays. Sixth, the maintenance of party lines.

Cardinal Gibbons is a man of singular opportunities for studying the country at large. I like to quote him in copying this verdict of his. Especially I like this suggestion of his about the national holidays.

The national holiday has now nothing to do with independence of George III. It is hardly worth while to repeat the black catalogue of what HE did or did not do. He is gone to his own place and is forgotten.

But if we use the national holiday to show, first, that open promotion is the right of every American citizen, we would do a great deal. Open promo-

tion, so that Abraham Lincoln, the rail splitter, may become President of the United States—so that no boy shall be born in the slums of Chicago but has as good a chance for education as he or she who shall be born in the purple.

Second, Freedom, absolute freedom. Do not tell an American carpenter that he shall not bring up his son to be a carpenter; do not tell an American locomotive driver that he shall only work ten hours a day if he wants to work eleven. The Declaration of Independence meant Freedom for Tom, Dick and Harry, as well as Freedom for Massachusetts, and Virginia and Carolina.

Third, somewhere and somehow, let every celebration of the Fourth of July

rub into the daily lives of people the important truth which in the last hundred years had been revealed to their ecclesiastical leaders—namely, that none of them are born for hell, that all of them are born children of God, able to enter into his work and to go about his business. Of the whole century, the greatest victory has been this, that the old theology of total depravity has gone where it belongs. The new world, the world of America in 1901 and 1912 and 1923 and 1934, and so on to the end of the century, this new world is a world in which men and women know that they share the divine nature if they will. They are to go about the Father's business, and they are to enter into the service which is perfect freedom.

BOSTON, MASS.

Summer Life in Luxurious Adirondack Camps

By William Frederick Dix

EDITOR OF *Town and Country*

AS you trundle your canoe on the little two-wheel cart across the short "carry" from Mirror Lake to Lake Placid, you pass through a leafy, green tunnel piercing the woods from lake to lake. And midway you have a bright glimpse of sparkling water at each end of the path. Slipping your canoe into Lake Placid and paddling out into its breeze-rippled surface, the influence of its calm beauty seems to come over you suddenly. On all sides rise rounded hills, heavily wooded with firs and pines; far in front, on the right, is a jutting rock resembling the Giesbach, on fair Swiss Lake Brienz; at the left lie Moose and Buck Islands, whose dense green is intensified by a speck of a rustic camp-dwelling here and there, and, as your back is toward the little colony of cottages and hotels at the end you are leaving, you feel that the mystery of nature's solitudes is sweetly enwrapping you in its spell,

"For the mountain lakes stand high
In the land where our souls have been,
We float where the gates of heaven are nigh
And the world may not come in."

Suddenly, from around a wooded point, a tiny fleet of canoes darts out into the glittering water containing rosy faced, white-clad girls and athletic looking young men in summer flannels. Some of the girls are paddling. Their sleeves are rolled up to the elbow and their hair shines, uncovered in the sun. You hear the tinkle of a mandolin, a snatch of song and little ripples of laughter, and the lake seems all at once to be smiling and human. Here and there on the shore, as you paddle along, are bark-covered boat houses which flash out from the thick, surrounding forest, with a gleaming yellow pine slanting platform in front, for the canoes and rowboats, and on the second story a piazza and living room, in which you can set wicker chairs and bright cushions. Behind each of these boat houses is a little group of five or six cabins, which comprise the summer home, technically called "camp." An Adirondack camp does not mean a canvas tent or a bark wigwam, but a permanent summer home where the fortunate owners assemble for several weeks each year and live in per-

feet comfort and even luxury, tho in the heart of the woods, with no very near neighbors, no roads and no danger of intrusion.

These beautiful Adirondack camps are usually built on the margin of some lake. Each has its group of log built, rustic cabins and each is usually reached by water only. The little steamboats bring the mail and provisions and guests, and tho the camp owner may have many hundreds of acres surrounding his camp, he wisely leaves it in its primeval con-

dition and often stocks it with deer and other game. Thus the wildness is preserved, and he and his household may roam the hills which are unmarred with roads and paths. The cabins cluster at the edge of the lake and the trees are trimmed just enough to afford views of it and to let in the sunshine.

The camp to which you are bound for a cup of afternoon tea is, perhaps, over on the other side of the lake, behind Moose Island, so you paddle out into the sunlight and across to the narrow water-

Copyright, 1902, by Burr McIntosh Studio

way between the island and the mainland. Far before you the White Face Inn appears and the lake in front of it is gay with rowboats and canoes. At the right, along the shore, a line of camps appears, some with flags floating over the boat house, and here and there, moored close in shore, are little clusters of canoes with people lounging in them chatting, reading, sewing or singing. For two or three miles you paddle along and finally, with a few vigorous final thrusts, you send your canoe sliding up the smooth platform of a boat house and your waiting host sits on the low gunwale to steady it as you scramble out. You gather up your coat and are escorted up a steep, mossy path, past one or two little cabins—the guides' house, store house and cook house—to the largest in the group. This, like the others, is built of logs, with the bark left on the outside. Inside, however, you find a great, square room with hard wood floor, walls hung with red burlap, polished beam ceiling, a great stone fire place and chintz covered and wicker

furniture. On the tables are books and magazines; guns, antlers and trophies of the woods are on the walls, and the place is delightful with an air of simple beauty and comfort.

Overhead are several bedrooms; a few yards away, connected by a covered gallery and in a separate cabin by itself, is the dining room, and, as you seat yourself on the enormous porch in front of the living room, you can look out through the trees over the lake without seeing any other human habitation.

This is a characteristic Adirondack camp. Naturally, no two are alike; some are elaborate, even to the point of questionable taste; some are really summer cottages with "all modern improvements," even to shaven lawns and formal flower beds, while others are little more than shelter from the weather, with bunks furnished with balsam boughs. But the truest type is composed of a group of rustic buildings on the edge of a lake, with pathless forests in the rear. Few who have not lived this

The Dining Room, Finished with White Enameled Wood Work, of Mr. Edwin Norton's "Stoneheng" on Mirror Lake

healthful, invigorating life can appreciate its wonderful charm. It is a return to nature after ten months of wearying city life with ceaseless formalities and responsibilities. Here the busy professional man or financier can find real rest and surcease from business as in no other way, and it is an interesting phase of American social life and decidedly significant. It has taken us generations to learn to appreciate the value of this camp life. As society has grown more and more complex, the swing of the pendulum goes more and more toward simplicity for the vacation. It took us many years to achieve the really comfortable summer hotel, and only within a decade or so has the cottage idea flourished. That, of course, is a vast improvement over the hotel life, and the pretty cottages in the mountains or at the seaside which have sprung up everywhere attest a truer idea of summer rest. So the life at these Adirondack camps is infinitely refreshing to the weary man of affairs, and all through this wilderness of six thousand square miles, containing over a million

acres of primeval woods and two million acres of woods of a newer growth, these summer homes are built. Nestling in the hollows among the hills are a thousand lakes, fed by rivulets and streams, and every summer thousands of holiday seekers find rest and new vigor in this paradise of hills and wooded glades.

Lake Placid has innumerable camps on its shores, Saranac Lake, about ten miles away, is also gay with them, and further north, on St. Regis Lake and Spitfire, there are many beautiful ones. One of the most elaborate of these is that of Mr. Anson Phelps Stokes, on St. Regis Lake, near Paul Smith's, and is a large group of cabins overlooking the lake and wooded islands in front. Mr. Alfred G. Vanderbilt's "Sagamore Lodge," the main house of which is built in the form of a Swiss *chalet*, and which has a forest surrounded tennis court, recreation house, stables and a large flotilla of boats, is at the head of Raquette Lake and eight miles from the nearest station. About two miles away in one direction

The Large and Airy Living Room in the Stephens Cottage, Lake Placid

The Oak Finished Living Room in Shawnee Camp, Lake Placid

is Mr. J. P. Morgan's camp, and two miles in another is the establishment of Hon. Timothy L. Woodruff, which is one of the most elaborate and picturesque in the mountains. Most of the rooms are in one large dwelling, built of logs, two stories high, and with a valuable collection of bear skins, deer heads, Mojave blankets and trophies adorning the floors and walls. There is a Venetian gondola among Mr. Woodruff's boats and a tame bear affords much amusement to the family and guests. Bishop

fishing, paddling, repairing paths or building little additions, and enjoying the refreshment of the woods.

Life in one of these camps is delightfully unconventional, and certain traditions of more primitive life are vigorously observed. Each camp has its pyre, upon which great logs and inflammable brush are piled, and often during the summer nights mammoth camp fires are lighted, friends from other camps assemble, coming in gay processions single file through the trails, each with an oil

Mr. Anson Phelps Stokes's Camp on St. Regis Lake

Potter, of New York, has an island entirely to himself, and, almost hidden in forest foliage, his little, half timbered dwelling is discerned only by the passing canoeist or the passengers on the steamboat. Hawk Island is the name of his mountain demesne, and it rises from the waters of Lake Placid near the Undercliff end. To visit these beautiful lodges in the wilderness would be to meet many of the prominent men of the times and their families, living a most informal existence, wearing stout, simple clothing, blazing trails through the forests,

lantern, and stories are told and songs are sung as the flames light up the great pine trees and are reflected in the lake in front.

During July and August camp life is at its height. The young men are here from college and the girls from boarding school; every room is occupied, and there are picnics and canoe parties galore, excursions up the various mountain peaks, swimming in the lake in front of the boat house, and a delightful buzz and gayety. There is no "dressing up," and evening gowns and dress coats are un-

known, while walking skirts and tennis flannels and knickerbockers are the order of the day—and evening as well.

All this is highly significant as a phase of American life. This Adirondack wilderness is not merely a vast playground for the rich, not merely a haunt for the fisherman and the hunter, not merely an exclusive pleasure preserve where money is lavished in great hotels, elaborate villas and luxurious "camps," too far away to be accessible to the general public, but a mighty object lesson in forestry and a source of wealth to the State and country. In Europe forestry is both an art and a profession, and there the magnificent tracts of woodland are preserved for centuries. Here, with colossal indifference, we allow our mountains to be denuded of trees by forest fire and by the vandal pulp and saw mills, inviting flood and famine and seriously affecting the source of streams and rivers. For three years the New York State Commission has had almost no money to work with in protecting the forests and the game and fish in them, and every year thousands of acres of beau-

tiful primeval woods are denuded by fire and the ax. But no one can live in one of these Adirondack camps and learn something of the beauty of the woods without growing to realize their inestimable value. These wealthy camp owners are already doing splendid work in buying large tracts of forest lands, restocking them with game and protecting them from destruction. Further, they are beginning to influence legislation and contribute to the funds of the commission, so that the encroachments of the pulp mills and the lumbermen will be restricted. Forestry is in its infancy in America, and one does not realize its tremendous importance till he has learned to love the woods. It is not merely a romantic idea, but of vital necessity to our farms and our climate, this protection of forests in our various mountain groups; and the men who build these rustic homes on the shores of St. Regis, Loon or Raquette Lake are beginning to exert an influence for good which will insure the preservation of those superb tracts of American forests for future generations.

NEW YORK CITY.

Our Lost Declaration of Independence

By North Overton Messenger

[The people of the United States will learn, with astonishment and profound regret, that the document bearing the Declaration of Independence is forever lost to them as individuals. Nor can any assurance be given that, as a nation, it will remain with us, even in the remnants of the inscription, for so long a period as reverent patriotism could desire. Secretary Hay has set the precedent, which the Department of State hopes to preserve inviolate, that no pressure of personal or political influence shall ever again expose the fading characters to light, which the best scientific opinion of the country has now inhibited as the most dangerous of the destructive agencies. In connection with Mr. Messenger's informing article we reproduce the photograph which was made, as a record of the document's exact condition, when it was sealed finally from the gaze of all eyes with the great seal of the Department.—EDITOR.]

GENERATIONS hence, some careful antiquary assigned to care for the Government archives in the State Department may be rejoiced with a glimpse of a sheet of parchment, blank but for a few scratches here and there—the last traces of what once was writing—and he will recognize only by its registration that most precious profession of human liberty and the rights of man, the Declaration of Independence. Immured from light, between two sheets of glass,

in a dark drawer of a great steel safe, the document is henceforth to be kept from inspection as the only hope of perpetuating for any length of time the legibility of the scroll.

But the doctors of science who, after anxious consideration, have decreed the confinement in solitary of the charter of liberty, could not guarantee its preservation. It would be impossible, they said, to save it for any length of time. The only way to extend its days was to give

it perpetual night. The parchment had been incased in glass for years, in order to protect it from the effects of heat, moisture and air; and, of late, it had been kept in a dark place. But every now and then some one with influence sufficient to compel compliance and not content with the *fac-simile*, open to all, would request a glance at the original, and the parchment would be exposed to light. Now, when exposure is absolutely prohibited, there will doubtless still come

some to clamor for the privilege denied every one else and so made doubly precious. Still, the Secretary of State has made it a permanent order that the document is not to be exposed, and, for the time at least, potential as the great seal of the Caesars, to be violated by none, is the seal on the safe, "Closed by order of the Secretary of State."

For a long time it was observed that the document was fading. Some of the signatures had completely disappeared

The Declaration of Independence, from a Very Recent Photograph

from the parchment, others were scarcely visible. A photograph of the scroll, taken in 1883, was produced and compared with the sheet, which made all the plainer the effects of the deteriorating influences, whatever they may have been. It was evident that it was but a question of years when the burning words of freedom, which were made good in the expenditure of blood and treasure, would disappear from the sheet and remain enshrined only in the hearts of the people.

The attention of the Secretary was called and a council of state was held. Opinions differed as to the cause of the trouble, and as to means for preventing its further progress. Correspondence with the officers of the British Museum, who are accustomed to handling ancient manuscripts, shed no light upon the Declaration's difficult case.

Secretary Hay decided to pass the question up to a court of last resort, which should include scientific knowledge of the highest order. A clause in the charter of the National Academy of Sciences provides that the Government may utilize the Academy; Secretary Hay appealed to Professor Agassiz, of Cambridge, for assistance.

A committee of the National Academy of Sciences was appointed, consisting of Dr. Billings, of the New York Public Library; President Remsen, of Johns Hopkins University, Baltimore, and Professor Chandler, of Columbia University, New York. The committee met recently in Washington, in the office of the Secretary of State. It was a very grave meeting, for every member appreciated fully the importance of the consultation. The document was drawn forth from its

receptacle and spread out. Powerful microscopes were employed to note the condition of the parchment and the ink; and most careful inspection was made by every one of those present. There was no doubt that the ink was fading and that light had a great deal of influence in the deteriorating processes.

The verdict of the committee was that the parchment must be kept away from the light, or, within a short period, it would be entirely bare of legible inscription. With the finding of the verdict, it was placed between the glass and laid away in a drawer of the fire proof safe.

The Declaration of Independence came to the Department of State from the Continental Congress, and remained in the archives until June 11th, 1841, when it was deposited in the Patent Office, at that time a bureau of the Department of State. The Patent Office was transferred to the Interior Department in 1849, and the Declaration was put on exhibition in that Department. Unfortunately it was placed where a strong light fell upon it, and the deterioration, which had commenced with its subjection to the *fac-simile* process in 1823, was accelerated.

The Declaration was exhibited at the Centennial Exposition, in 1876, and was viewed there by thousands. Upon its return to the Department of State it was deposited in the fire proof quarters occupied by the library of the Department. It was not until 1894 that the necessity for absolute exclusion from it of light and air was recognized. Then, at last, the document was carefully wrapped and placed flat in a steel case. Now it will never see the light again—at least not in this generation.

WASHINGTON, D. C.

Ad Patriam

By Clinton Scollard

To deities of gauds and gold,
Land of our Fathers, do not bow!
But unto those beloved of old
Bend thou the brow!

Austere they were of front and form;
Rigid as iron in their aim;
Yet in them pulsed a blood as warm
And pure as flame;—

Honor, whose foster-child is Truth;
Unselfishness in place and plan;
Justice, with melting heart of ruth;
And Faith in man.

Give these thy worship; then no fears
Of future foes need fright thy soul;
Triumphant thou shalt mount the years
Toward thy high goal.

CLINTON N. Y.

The Carlyle-Froude Dispute

By Andrew Lang

THE controversy about Froude and Carlyle does not seem to agitate mankind, despite its revival. Whatever may have been the impression of men twenty years ago, opinion has settled in the belief that Mr. and Mrs. Carlyle were born with all the sensitiveness of genius, that they could not be happy as other folk are, that both had faults, that Mr. Carlyle deeply, perhaps too deeply, deplored his own, and wished the fact to be understood, and that Mr. Froude, in a position of intolerable and unprecedented difficulty, endeavored to carry out the wishes of his friend. Errors in detail he may have made (as he frankly confessed), but he told, as discreetly as might be, the truth as he understood it. On points in this affair I shall not venture from which the mind turns with aversion. But as to Mr. Froude's honorable discharge of his trust, I am the more bound to express my opinion as, in the field of the sixteenth century, I have often had to utter my dissent from his conclusions. I shall examine the censures of Sir James Crichton-Browne in "The New Letters and Memorials of Jane Welsh Carlyle." Sir James, happily, does not, like Mr. Lilly in *The Fortnightly Review* (June), accuse Mr. Froude of deliberate mendacity. He rather supposes that Mr. Froude began from a false conception, and was irritated by criticism and opposition into obstinacy that he disobeyed Mr. Carlyle's injunctions, and that he was fundamentally inaccurate, tho "it is impossible to believe that Froude contemplated or foresaw the evil he wrought." Mr. Froude did foresee the endless trouble which he would incur if he carried out Mr. Carlyle's wishes. "So dangerous a task," he calls it, tho "I was not prepared for attacks on my character as a gentleman and a man of honor." ("My Relations With Carlyle" (1889), pp. 28, 29.) Unfortunately both Mr. Froude and

Mr. Carlyle's niece, Miss Aitken, later Mrs. Alexander Carlyle, trusted too much to verbal statements, made by a man now old, ill and of wavering will. That is the source of half the evil.

Sir James says that Mr. Froude had "a preconceived" notion of Carlyle's relations with his wife, which was radically wrong. Why "preconceived?" Mr. Froude was, for many years, most intimate with Carlyle and his wife; after her death he was the recipient of Carlyle's gloomy reminiscences. Mr. Carlyle himself wrote that his own work on Mrs. Carlyle's Letters might be, for him, "wholesome punishment." Punishment for what? It is, on the one hand, vain to split hairs about Mr. Carlyle's loose employment of the word "remorse"—he always expressed every emotion with exaggeration—and it is, on the other hand, futile to deny that he did conceive himself to have made his wife less happy than he might have done. Mr. Froude not only knew but stated the former point—Carlyle's affectionate but morbid exaggeration of his own errors. "Faults there had been, but such faults as most married men commit daily and hourly, and never think them faults at all. . . ." ("Thomas Carlyle," II, 410, 1884.) These were Mr. Froude's impressions on reading some papers intrusted to him by Carlyle in June, 1871, "to do with as I pleased after he was gone."

But, apparently, after studying Mrs. Carlyle's journal, and hearing the deplorable story of Miss Jewsbury, in 1880, Mr. Froude found that "I could not tell him that there was nothing in his conduct to be repented of, for there was much, and more than I had guessed." Sir James Crichton-Browne, so rigid about accuracy, cites this phrase (without giving a reference) as "more than he had guessed."

Now look at Mrs. Carlyle's journal of July 5th, 1850. "In the evening alone,

as usual; a very sick and sad day with me, like many that have gone before . . .” Could a husband, a man of heart, read these lines after his wife’s death, and not feel “remorse;” could Mr. Froude read them, and doubt that Carlyle had reason for “remorse”? “Very sick and sad” Mrs. Carlyle was, and had been. Sir James learnedly explained that at this time “she passed through a mild but protracted attack of mental disturbance,” “climacteric melancholy” and “neurasthenia.” But the “idolatrous” marriage service (as Mrs. Carlyle’s ancestors called it) bids us married people stand by each other, “in sickness and in health, for better and for worse.” A man is not to leave his melancholic and neurasthenic wife “alone in the evening, as usual.” I do not know whether Carlyle was talking with Lady Ashburton, or taking walks, or was absorbed in his work. But he usually left his sick wife alone in the evenings. When he read that record of hers he felt as you or I would have felt, but more acutely, and he expressed his emotion more loudly and longer. Mr. Froude believed Mr. Carlyle to wish all this to be exposed to the world. He obeyed his orders, and so he is denounced as “Virulent!”

As to Mr. Carlyle’s walks of “thousands of miles” (as Mrs. Carlyle writes) to Lady Ashburton’s, the question of his behavior is insoluble. How much ought a man to yield to the jealousy of a sick wife who dislikes being left alone? Nobody can answer. But, when the wife is dead, if the man has a heart, he feels remorse and there is an end on’t. No special pleading can obscure the issue.

However, no friendly biographer wants to drag such sorrows before the world, unless he has a rather fanatical Carlylean theory about “the whole truth,” and had the orders of his “biographee.” Mr. Froude had both. Sir James says, “he overlooked the solemn injunctions which were the condition of his trust.” That is just the question. Did he? From 1866 to 1869 Mr. Carlyle wrote down his wavering ideas as to the disposal of Mrs. Carlyle’s Letters and so forth. In 1866 the “Reminiscences were not to be published.” In 1871 he gave the mass of papers to Mr. Froude, to use

as he chose. He gave Mr. Froude verbal leave to publish according to his discretion. In 1873 Carlyle gave him papers of all sorts, to be the material for his biography. “It is a remarkable fact that Froude’s commission to write a life of him rested entirely on his own memory, unsupported by any documentary evidence,” says Sir James. It is not at all more remarkable than that Carlyle’s gift of the papers to his niece, in 1875, also rested entirely on her memory, and that Mr. Carlyle’s executors, as one of them, Sir James Stephen, writes, “never heard of it until 1881, after Mr. Carlyle’s death.” But Sir James Crichton-Browne never mentions, as far as I observe, this remarkable fact. In 1873 Carlyle made his will, saying that Mr. Froude was “taking charge” of “my manuscript entitled ‘Letters and Memorials of Jane Welsh Carlyle,’” “to him I give it. . . . to do his best, and wisest in the matter.” Now pray observe Sir James’s accuracy and charity! He writes: “It is characteristic of the looseness of Froude’s methods that he states in the ‘Life in London’ (Vol. II, p. 408) that the manuscript of ‘The Letters and Memorials’ was placed in his hands in June, 1871, whereas Carlyle, in February, 1873, speaks of it in his will as being still in his possession.” Yet Sir James, three pages back, quoted Carlyle’s own will to the effect that Mr. Froude “takes precious charge of that manuscript in my stead.” Not Mr. Froude, but Sir James exhibits looseness of methods—with no excuse but that of utter carelessness and desire to find fault.

Mr. Froude, undeniably, had the right to use his discretion in publication. That he “gerrymandered” the MSS. is Sir James’s opinion. In fact, he treated them as he deemed to be for the best.

About 1880 Carlyle gave Mr. Froude another verbal direction to “return those papers of mine to Mary,” his niece, “when you have done with them.” Mr. Froude did so, later, “when he had done with them.” Three months before his death, Carlyle talked to Mr. Froude about what we may call the “remorseful” papers. Mr. Froude said that he would publish Mrs. Carlyle’s Letters and the Memoir also. “He seemed at once relieved and easy. He

said I must do as I pleased. . . . He threw the responsibility on me. . . . So Mr. Froude used the papers as his discretion enlightened him. There was an uproar. On May 5th, 1881, Mrs. Alexander Carlyle, according to Sir James, "published in *The Times* her uncle's solemn injunction (which Froude had suppressed) against the publication of that paper in the 'Reminiscences,' entitled 'Jane Welsh Carlyle.'" Apparently the "injunction" is that of 1866, which, as far as I can see, Mr. Carlyle had nullified. Sir James does not here date "the solemn injunction." If it was that of 1866, it had long ceased to be binding. Irritated, naturally, Mr. Froude offered at once to restore "the remaining papers" (tho he was not yet "done with them") to Mrs. Alexander Carlyle. Next day he withdrew from a hasty promise. In fact his fellow executor would not allow him to keep it. Other reasons he had, but of *this* reason Sir James Crichton-Browne makes no mention. Sir James Stephen writes (December 9th, 1866) that, on counsel's advice that the papers "belonged not to you personally, but to Mr. Carlyle's executor. . . . you could not have given them up without my consent, and I never gave nor would have given it." Sir James Crichton-Browne does not mention this obstacle. He says that Mr. Froude was represented as "unable" (to give the papers up before he was done with them) "because of a possible claim on the part of the executors on behalf of Carlyle's residuary legatees." He tells us how this argument was met, but he does not tell us (and I presume that he did not know), that Mr. Froude's coexecutor would not allow the papers to be given up. Mr. Froude returned them, of course, when he had finished the work which Mr. Carlyle asked him to undertake. He had said what he deemed it right to say, and had not said what (despite the impossible theory of "the whole truth") he deemed it better to keep concealed.

He thought that Carlyle was not born on his wife's "social level," and Carlyle most emphatically was not, if the point is to be discussed. You can look at the portraits of Dr. and Mrs. Welsh, at the

photograph of their house in Haddington. The portraits of Carlyle's father and mother would represent good people—not a gentleman and a lady. "As a small tenant farmer's son," says Sir James, "he was on the level of a country doctor." Look at the photographs! Mr. Carlyle may have been of the ancient and noble house of Turthorald, as has been asserted (tho, as far as I can see, the line was extinct by 1600), but his father and mother were not on a level with those of his wife. The thing is unimportant, but they were *not*. Tho she is said to have been born on Carlyle's level (which is an error), Sir James also tells us that Mrs. Carlyle "was brought up under hot bed conditions," which a girl in Carlyle's rank could not have been. Miss Jewsbury said that Mrs. Carlyle once thought of drowning herself. Sir James says that she felt "strong suicidal promptings."

On the whole, thanks to the theory of "the whole truth" in biography, this poor lady, having married a man of genius, has had hard posthumous fortunes. If Mr. Carlyle had much to bear from her, she had much to endure from him. In what is the world the wiser or the better for having the roof lifted from the house, and the sorrows of two fiery, cross-grained, unhappy, but loving people displayed, and canvassed, and wrangled over? The theory of "the whole truth," tho well meant, and Carlyle's own, is impossible and inhuman. Mr. Froude, tho he held the theory, could not act upon it! He could not cite the whole of Mrs. Carlyle's journal. The moral is that great men of the pen should prohibit the publication of their Lives and Letters. If all of them were Scots, if all biographers were Lockharts, the case would be different. But such subjects and such biographers are rare; and they are wise who refuse to have their sins and troubles revealed to a world which cares much more for gossip about them than for their works.

That is the moral at large: while, to the best of my apprehension, Sir James Crichton-Browne has undertaken a task in which he has failed to attain strict accuracy, the judicial temper and "sweet reasonableness."

The Menace of the Tower

A WORD FOR INDEPENDENCE DAY

By Edwin Markham

AUTHOR OF "THE MAN WITH THE HOE AND OTHER POEMS," ETC.

*In storied Venice, down whose rippling streets
The stars go hurrying, and the white moon beats,
Stood the great Bell Tower, fronting seas and skies--
Fronting the ages, drawing all men's eyes;
Rooted like Teneriffe, aloft and proud,
Taunting the lightning, tearing the flying cloud.*

*It marked the hours for Venice: all men said
Time cannot reach to bow that lofty head:
Time, that shall touch all else with ruin, must
Forebear to make this shaft confess its dust;
Yet all the while, in secret, without sound,
The fat worms gnawed the timbers underground.*

*The twisting worm, whose epoch is an hour,
Caverned its way into the mighty tower;
And suddenly it shook, it swayed, it broke,
And fell in darkening thunder at one stroke.
The strong shaft, with an angel on the crown,
Fell ruining; a thousand years went down!*

*And so I fear, my country, not the hand
That shall hurl night and whirlwind on the land:
I fear not Titan traitors who shall rise
To stride like Brocken shadows on our skies--
Not giants who shall come to overthrow
And send on Earth an Iliad of wo.*

*I fear the vermin that shall undermine
Senate and citadel and school and shrine--
The Worm of Greed, the fatted Worm of Ease
And all the crawling progeny of these--
The vermin that shall honeycomb the towers
And walls of state in unsuspecting hours.*

WESTERLEIGH, STATEN ISLAND, July 4, 1903.

The Root of the Matter

By J. Irving Manatt, LL.D.

PROFESSOR OF GREEK IN BROWN UNIVERSITY

TO breed a gentleman, it has been said, you must begin with his grandfather; but, in fact, the schooling of every one of us, gentle or simple, began with our first parents, whether under a tree in Eden or up a tree elsewhere. The babe born to-day brings latent in his little brain the accumulated consciousness of (it may be) a thousand generations; and life and school have just to wake him up, open his eyes, and set him thinking. Alas! what liberties are taken with this cosmic process by people who would not reform the Decalog or tinker with the law of gravitation.

Hardly a decade passes without putting on the market a brand-new education, whose forerunners shout "old things are passed away"—until the next new thing sends it packing in their train. Thus we peg away, pulling down what the fathers builded and rooting up what they planted. Our elbowing age would ban the ripe and the sweet; for are they not diseases of a culture "essentially unsympathetic, aristocratic, exclusive?" This menace to democracy and the social order is that hoary sinner, "the classical ideal"—upon whose head the New Education (for the time being) lays both hands to confess over him all the iniquities of the children of Israel. And then, when she has headed the heavy-laden brute for the wilderness, she makes haste to wash her clothes and bathe her flesh with water—that no taint of the old thing may cling about her, but all things be and abide fresh and raw!

Now this is not a plea for the classical ideal—peace to its ashes; only a search for the jewel we have flung away with it—namely, the power of the mother tongue. For that is the root of the matter in all education, new or old, as it must be the fruit of the matter in any education worthy of the name. I have, then, no apology to make for rushing in, an uncalled Iolaus, to the help of our Hercules in his battle with the Hydra—as gallant a fight with as grim an ad-

versary as any in olden time. God speed every well-aimed blow of our English colleagues in school or college; but this is our fight as well as theirs and we cannot do our part by simply crowding the grand stand and clapping our hands. If ever we are to win out in this war, we must mobilize all our forces; every teacher, high or low, no matter where or what he be set to teach, must teach and preach pure English—ay, and practice what he preaches! Every lesson in every subject in every school must be a lesson in the mother tongue. This is, indeed, a counsel of perfection; but if we Greeks live not up to it, let us be anathema. The other tribes may speak for themselves; but if either Greek or English must perish from the earth, then good riddance to Greek. Only have a care lest in felling the old tree you cut the tap-root of the young one!

Post hoc is not *propter hoc*; yet it is a singular coincidence that the English plague followed so hard upon the heels of the college fetish. It was just a dozen years or exactly one school generation after Mr. Charles Francis Adams declared war on Greek—a war whose savage trophies ensanguine so many of our already barbarized high schools and fast barbarizing colleges—that he suddenly found the Harvard Freshmen to be shamefully short on English. Somehow the father's sour grapes had set the children's teeth on edge; and, as chairman of Harvard's English Committee, Mr. Adams has ever since been tinkering with the teeth instead of dressing the vineyard.

If now we are to go to the root of the matter, we must not only reclaim the neglected vineyard, but we must seek those conditions of soil and sun which alone can yield us the ripe and the sweet. If we cannot actually begin the schooling of the child with his first parents, we may catch the child himself in his cradle, and there begin a schooling that shall have its perfect work in the generations to come. Before the "trailing clouds of

glory" have quite faded out or the "divine ideas" are quite darkened in him, he must be taken in hand; and for this our child-students are preparing the way. But child-study begins at home—not so much with our children as with ourselves; self-knowledge is the one sure thing. No man ever grows too old to remember his earliest inspirations, not even if he have lived them down; certainly not if they were but the first faint flutter of wings that have grown with his growth and strengthened with his strength. Let every man examine and confess himself, and we shall have a body of experience more precious than gold. If I may open the confessional, I date my own call to the intellectual life from the moment (it seems ages ago) when I first climbed my grandmother's knee and heard her read in sweet, low tones from the old family Bible. The call was repeated when my first teacher in the little country school-house, our first day's lessons done, stood up among us and said a simple, fervent prayer. But what made my calling sure was the lean, lank Hoosier, who, on a sleepy summer day as we two sat fishing from my father's mill-dam, spouted Shakespeare by the hour. He had not had the idealism fattened out of him; nor had another who at the psychological moment put in my hands "*Hyperion*," the first pure, living English prose it was my fortune to read. And to this day I cannot go into the Maine woods but Longfellow's phrases are ringing in my ears "like a wind sighing through a forest of pines;" nor can I go to Heidelberg without seeking out all Paul Fleming's haunts, tho it cost a Sabbath day's journey to the green, dark valley, with the brooklet still "telling how it is on its way to the mill."

So simple are the things that revive the divine ideas in us, that set our souls athirst for somewhat beyond meat and drink. To produce such impressions, if we may; to seize upon them, however produced, and make them strong wings for the spirit of youth is the first business of education. Without this inspiration we may indeed train the hand to feed the mouth; and if to make a living were the whole of life we might be content with that. But the end of education is not to make mechanics; it is to round out God's

work in making men. Now, with all deference to Mr. Galton's figures, there must be in the average human being the making of a man, and the social problem is to realize this promise and potency. Great men will never abound, genius will always be a century-plant; but society must make the most of the individual within the range of his powers. The masses may have but a short and simple schooling, but so far as it goes it should take hold on the same motives and build up the same quality of man that the highest culture invokes and produces. The man who lives by the sweat of his brow needs a sustaining inspiration not less, but more than his brother who lives by the sweat of his brain. And if this inspiration be brought to bear all along the line, no matter where the pupil may quit the ranks—be it for lack of further capacity or of further opportunity—he has had the best that schools can do for him. And many a one who falls out early in the day may have won a better degree than many another who makes the whole campaign.

And, now, what has all this to do with the English question? Much, every way. For the great army of youth the mother tongue holds the whole store of culture—is at once inspiration, means and end. In the early stages of education it has the field to itself, and if its work be not well done here the cause is lost. College or secondary school may save so as by fire some few of those who come limping up to them; but in the average case the youth of thirteen who still sins against the cardinal commandments of the mother tongue will die in his sins. Thus the common school is our real battle ground; and there we must concentrate our courage and our strategy.

First, we must have there teachers alive to their finger-tips—teachers not by rule of thumb, but by grace of God. Perish the thought that anybody who *knows* things can teach little children. I have taught as well as studied in the lonely little red schoolhouse (ages before it was painted), in secondary school, college and university—East, West and in between; and I venture the assertion that it is a deal easier to conduct a university than to teach an ungraded country school. The college president has but to

say "go," and scores of professors move on the enemy's works; but the master in the little red schoolhouse treads his weary round alone, and happy he whose strength is equal to his day. That it never can be, save as the spirit within him is fine enough to transmute drudgery into delight and strong enough to possess and uplift the school. In rare cases this may come through the mere power of personality; in the average case it is simply a question of finding a lever that will lift the more or less inert mass. Now, the lever is the WORD—the chosen word. Chosen, first of all, for CHARM: it must go straight to the heart and live there. And the teacher who can read—who can really read with the spirit and the understanding—has a precious gift. To seek out the best that has been written, the great words compact of charm and power, and interpret them as only a sensitive, sympathetic reader can—is there any readier means of stirring to the intellectual life? And is there any surer way to quicken that sense of the beauty of words without which the study of any tongue is but a poor servitude? Certainly, in the earlier grades it would not be time lost if five or ten minutes were taken out of each hour for such reading of some perfect bit of English prose or verse. And that would go far to form a taste for reading and a pure taste even before the child can read for himself. That is why it is better to read a fine story than to tell it, even if it lost nothing of its finish and its fragrance in the telling: it reveals the hid treasure in the book to be had for the digging. Thus it brings to bear the prime motive of study.

And what a treasure it is that our seers and singers from Dan Chaucer down have garnered for us! Where is the sage who shall sift it all and sort it out for the seven ages—at least for the schoolboy with the shining morning face, no longer, in that event, to go

creeping like snail
Unwillingly to school.

Give us this golden treasury of child-literature and a generation steeped in it, and the English question will well-nigh take care of itself. No Greek boy schooled in Homer and the Attic singers would mangle his mother tongue; no more will our youth when nurtured on

the sincere milk of the word—in the Bible and Shakespeare and Tennyson and all that tuneful choir. The Greek boy to-day starts in with his *Homeric Vocabulary*, a charming little school-book telling over again in the simplest terms the great stories of his fathers' gods and heroes. And our Hawthorne has told our youth the same tales—poor, "thin, rustic, provincial" Hawthorne, with whose telling we must e'en make shift until Mr. Barrett Wendell can take an afternoon off and do them genteelly! We want now a First Reader in Homer—not a dilution, but the cream of the great epics, even as Homer would have sung them had he spoken our tongue—to people the young fancy with the great figures at Troy and in the fairyland and far-seen isle of Odysseus's *Wanderjahre*; for I cannot too often return to the point that we must minister to the imagination if we are to accomplish anything. As Lowell said of John Bull, we have had the idealism too much fattened out of us; and if we are to join in any quest of Golden Fleece or Holy Grail or Pure English we must e'en get it starved into us again. With Wordsworth:

"I'd rather be
A Pagan suckled in a creed outworn,
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea,
Or hear old Triton blow his wreathèd horn."

As we read these beautiful things and feel their uplift, we shall seize the psychological moment to organize a nobler quest than that of Golden Fleece or Holy Grail—the quest of the Lost Jewel of the Mother Tongue. Every knight of the new order, laying hand on hilt (or sweep), shall vow to draw water only from the well of English undefiled; "The sweetness of the lips increaseth learning" shall be his watchword; his battle-cry, "No quarter to slang!" And how shall we stamp out slang—slinky slang, silly slang? Only by the expulsive power of a new affection. Inculcate live, sweet, pure, terse English—smacking of the salt sea, racy of the soil, breezy of the hills, redolent of the woods; and slang will slink away and hide its Hydra head.

But how to get our captains? Whatever other qualifications be required, the one fundamental and indispensable qualification for every teacher in every grade and every department of every school is command of the vernacular. Command, I say advisedly; for if he is to teach anything well he must have the power of the mother tongue as his medium; and, if my main contention is sound, he must have that power because—will he nill he—by example, if not by precept, he is a teacher of English. Throughout the public school system, especially, that qualification ought to be as strictly exacted as is the physical examination for the army and navy. A single teacher in any subject in the habit of using and so (naturally) of tolerating slovenly English is simply undermining the work of his English colleagues. Here at Brown, for example, in a teaching staff of eighty, twelve men carry the English work; we are nearly seven to their one, and without our best co-operation, not to say against our virtual resistance, even a

dozen Lamonts could make small headway.

How the English teacher, proper, is to be trained for his calling is a further question which I cannot go into without breaking my parole and magnifying the "classical ideal." For my own part, I have found but one royal road to English, and that is the king's highway of the old classical discipline. Lowell had traveled that road when it was rockier than it now is, with fewer shady stretches and cool springs and inviting inns; and on Harvard's greatest day, in the face of the flaunted college fetish, he spoke of it as became one of that royal society "steeped in and saturated with Greek literature." "We know not," he said, "whither other studies will lead us, especially if dissociated from this; we do know to what summits, far above our lower region of turmoil, this has led, and what the many-sided outlook thence." To those serene prospects he who would be an English master may well lift up his eyes.

PROVIDENCE, R. I.

The Heart of the Republic

By O. C. Auringer

I

NEW worlds are never won by cleverness,
Nor ever yet did wit transport a state;
And there are hearts no art can medicate,
And wrongs no spell of intellect redress.
Frail tongues and wisdom, powerless to possess
The Eden closed to knockings of debate,
While impulse, blindly feeling, finds the
gate,
And faith, cloud-footed, stumbles to success.
That statecraft, but the universal heart,
Full flooded, throbbing toward a fairer sway,
Brings the new reign, the lordlier dynasty;
As rapt Columbus, yearning o'er a chart,
Launched in a vision, groping for Cathay,
Fell on fresh Edens in the Western sea.

II

America, my heart's fair Holy Land,
Not few bold Pilgrims of my blood have
pressed
Thy sacred soil in freedom's lofty quest;
And well I know what zeal behind the hand
Aimed the bright lance and swung the joyous
brand
That sang on helm and harness—that high zest
Which thrice thy glorious hosts in helm and
vest
Fired, when the Paynim Crescent lit thy strand,
Fierce Israel's hawk, Rome's falcon, and the wing
Of Moslem vulture, sinister of dye,
Hlave chased love's bird from Palestinian
bowers;
Ah, may no like dark spirits ever spring
To hunt the lordly eagle from thy sky,
So nursed in fire, O Holy Land of ours!

NORTHWOOD, N. Y.

LITERATURE

English Literature

It is necessary to say that this third volume* of a work on which publishers and author have expended so much care is a disappointment, almost a failure. The weakness of the plan was sufficiently evident in the first volume which we reviewed last week, but the present section can be characterized only by the words scrappy and ineffective. This is partly due to the author's well known lightness of manner, and partly to the plan of the work which renders any genuine labor of criticism really out of the question. In the first place the very wealth of illustration makes any serious writing on the part of the author or thoughtful attention on the part of the reader almost an impossibility. To have the mind called every minute from the letter-press to some portrait or *fac-simile* is to preclude any consecutive train of ideas. This inherent weakness is further increased by the spasmodic disposition of the biographical and critical paragraphs. As an example, take the treatment of Milton.

Beginning on page 10 we have a pleasant but loosely constructed account of Milton's earlier life and career as a poet, with extracts from the "Nativity Ode," "At a Solemn Music," and "Comus." Follows, on pages 15 to 18, a formal biography of Milton in finer type. After an interval of fourteen pages devoted to a number of the cavalier poets, we come to a brief, insignificant paragraph on Milton as a prose writer, with an extract from the "Areopagitica." After another interval of forty-eight pages given up to various prose writers and poets, Milton again appears as the author of "Paradise Lost." And once more, after a further interval, we reach, on page 95, another general and inconclusive paragraph on his position as "a vast unrelated Phoenix" in his age. There is no

where shown any grasp of Milton's work as a whole, no criticism beyond that of the tritest and most ordinary sort, no study of Milton's form, no serious comparison of his method with that of his great predecessors, no clear account of the origins of "Paradise Lost" in Milton's mind. The whole treatment is scattered and flabby, and it is a specimen, unfortunately, of much that the volume contains. It is all vivaciously written, to be sure, and makes fairly easy reading, as Mr. Gosse's writing always does.

A certain vivacity and smartness is indeed a marked trait of the book as a whole. Sometimes this shows itself in admirably clear and pointed characterizations, as, for instance, this epigrammatic comparison of two religious poets: "But while we cultivate Crashaw for the flame below the smoke, we wait in Vaughan for the light within the cloud." That is a metaphor which really assists the understanding. At other times this jaunty manner is in more questionable taste. Certainly it conveys a wrong impression of Sir Thomas Browne to picture him as "dancing on the tight-rope of style." Such an inept comparison is not lightly forgiven in an historian of literature. Nor do we like, on the very first page of a volume, to see an attempt to sum up so portentous a work as Burton's "Anatomy of Melancholy" as a "monograph on what we should now call neurasthenia." Any one who has read the Preface to that work ought not so far to succumb to facile cleverness as to mistake the spirit of Burton for "neurasthenia." Were this volume less pretentious in design and appearance, less bulky in actual material weight, such criticisms of its manner would be unfair: possibly it is still ungenerous. As an agreeable account of literature from Milton to Johnson, it would be highly welcome if presented in handy form. As it is, nothing less than a monumental work of historical criticism could be pardoned in so monumental a volume, and this Mr. Gosse has quite failed to give us. The book is really valuable as a treasure-

* ENGLISH LITERATURE. *An Illustrated Record in Four Volumes. Vol. III. From Milton to Johnson.* By Edmund Gosse. New York: The Macmillan Co. \$6.00.

house of illustrations, and for this reason it ought to be, and no doubt will be, in every library of any pretensions to completeness. Even here we must regret that the explanations of the pictures are not a little fuller. The source of the illustrations ought to be indicated more exactly, and some notion should be given of their relation in size to the originals. We have yet to wait for a full and really authoritative history of English Literature, and the need for such a work is pressing.

The Life of Browning

MR. CHESTERTON brings to his task,* which is by no means an easy one, several advantages which might have been lacking to a more positive critic attempting to deal with so tricky a sprite as Browning. First of all he brings with him an easy belief in the virtual identity of literature and life. He is also an optimist of the kind which understands "the one grand and logical basis of all optimism—the doctrine of original sin," and enough of a humanitarian to take Walt Whitman seriously. For the application of these convictions, in their own nature rather nebulous, he possesses an unusually pliant and sinuous sort of criticism, subtle rather than profound, running to epigram and paradox. Indeed, paradox may be said to be his method. But, above all, he has that without which no student of Browning is reasonably complete—a strong disposition to rummage.

Now all this produces some very clever and effective writing. Nothing could be better in their several ways than the alchemy of transmutation to which Mr. Chesterton subjects the notion of conventionality or his demonstration of Browning's art from his artlessness. But what is most significant is that this sort of thing is beginning to form a kind of present day criticism, characterized by negative rather than positive qualities—by the lack of principle, and especially by the lack of that sense of literary catholicity and succession, that strong instinct

of tradition and of the solidarity of literature as a whole, which made Sainte-Beuve. This constitutes the advantage of which we spoke in the beginning; for in these respects the criticism is the counterpart and interpretation of the literature with which it deals and by which it was inspired.

From the application of this criticism to Browning, therefore, two or three things seem to become apparent which the author apparently had no intention of conveying. And this, we suspect, is the significance of the book: that its effect is different from its intention. It becomes apparent, then, in a dim, half-realized way that much of the literary activity of the latter part of the last century has been expended upon a set of experiments, brilliant indeed, but clean out of the way, cut off from the main body and tendency of English literature—a sort of literature of dissent or hole-in-the-corner literature, if it must be named, which has arisen more or less under Browning's influence and of which his work is the best representative. The character of all these attempts may be summarized in a single phrase—the attempt to express the inexpressible, to push representation out a little farther than it is fitted to go into the regions of the impalpable obscure, amid the fogs in the brain.

To a certain degree this literature of the curious, of the exceptional, was and is still due to a lack of definite tendency in the influences which produced it. It will be noticed that the particular "moment" to which Browning belongs was a moment that failed to pursue anything really worth while on its own account. The weakness of a material age lies not so much in its materialism *per se* as its lack of a satisfactory object. Men are vaguely discontent without knowing what they want; they are troubled in their partial and unprofitable interests, like the French artists for the art's sake, and the trouble within them is communicated to their work. Along with this there naturally goes a gradual loosening of the sense of form. Indeed, such is our present vacuity that we have generally come to prefer the infinite suggestiveness of the indefinite to the rigidity of a particular figure, which does, as

* ENGLISH MEN OF LETTERS: ROBERT BROWNING. By G. K. Chesterton. New York: The Macmillan Co. 75 cents net.

a matter of fact, confine at the same time that it informs the spirit. And when we do undertake to express ourselves we do so vaguely, elusively, in order to weave as large a mesh as possible. "There is," says Mr. Chesterton, "a certain kind of fascination, a strictly artistic fascination, which arises from a matter being hinted at in such a way as to leave a certain tormenting uncertainty even at the end." This is pretty nearly the last pass for poet or critic.

It is these things that have finally produced that sort of contempt for literature as distinct from life, from all that is abrupt, poignant and irrational, of which we recently spoke, and have resulted in giving literature into the hands of those who are primarily something else than authors. For the one point above all others which Mr. Chesterton makes clear, tho again without intending just this, is that all the art which Browning expresses is fundamentally lacking—in what else can we call it than the literary sense? "It was part of the machinery of his brain that things came out of it, as it were, backwards. . . . He was, in other words, at least in his prose and practical utterances, more or less incapable of telling a story without telling the least important thing first." The whole passage is very instructive. And the distinctive mark of this failing is that his writing gets lost so often in inessentials. So Mr. Chesterton speaks of "his peculiar sense of material things, all that power of writing of stone or metal or the fabric of drapery, so that we seem to be handling and smelling them;" while in another place he remarks upon his "intense love of the holes and corners of history." But the same truth comes to even more salient and significant expression. "He was one of those who achieve the reputation, in the literal sense, of eccentricity by their frantic efforts to reach the center." Exactly; there lies the conclusion of the whole matter. It is of that class of men who are not born to letters, or are at least disconcerted by the vagueness of the times, that Browning, as all Mr. Chesterton's book points, has made himself the representative by his "frantic efforts to reach the center."

Ego et Deus Meus

WHATEVER may be thought of the speeches and sermons of the German Kaiser as literature, there is no doubt that as a revelation of the character of a very puzzling, elusive, altogether uncertain personality, they are invaluable.* They exhibit William II—he is always on exhibition—with such a many-sided temperament that in comparison with it that of Dryden's Buckingham is simplicity itself. The art of government by no means exhausts his restless activity. It leaves him leisure to be a painter, a poet, a musical composer, an architect, a scene shifter, and several other things besides. In this portly volume we have his opinions on almost every question that comes within the range of human curiosity, and always settled *ex cathedra*. *Gulielmus locutus est, causa finita est*.

Perhaps the most striking feature in the imperial utterances is the clue they afford to the Emperor's attitude toward God. Ordinarily the more the words of sovereigns are weighed the less they count; but official eloquence ceases to be commonplace in the mouth of a ruler who dwells, in almost every speech, on the diplomatic relations between himself and Providence. William is undoubtedly a sincere believer; he could not well be otherwise, for his deep, mystical belief in the divinely granted authority of kings renders such belief absolutely necessary. If God did not exist he would have to be invented for the special purpose of consecrating a Hohenzollern emperor. God is William's suzerain; William is God's greatest feudatory, his ally. They have reciprocal obligations, just as William and the King of Saxony or the regent of Bavaria have. He often reminds God of his obligations, and points out to him the injustice he would perpetrate if, after choosing a privileged being like himself to represent him on earth, he should refuse constant and ample assistance. A number of passages might be given in proof of this:

"You know that I look upon my position and

* THE KAISER'S SPEECHES. *Edited by a German for Portrait of Emperor William II. Translated and Edited with Annotations by Wolf von Sappbrand, Based Upon a German Edition Made up of Oscar Kraussmann.* New York: Harper & Bros. \$2.50 net.

upon my whole task as one set me by heaven; that I am merely executing the mandates of one higher than I." (P. 298.) "To that must be added the sentiment of responsibility toward the Most High which lives in me, and my rock-like conviction that our Great Ally (God) of Rossbach and Dennewitz will not fail me. He has taken such an amount of pains . . . with our House of Hohenzollern that it is not to be assumed he will have his pains for nothing." (P. 360.)

Speaking of the Socialists (p. 304),

WILLIAM II.
Copyright by Harper & Bros.

he declares that "That party which dares to assault the foundation of the state, which rebels against religion, and which *does not even halt before the person of the most august ruler*, must be overcome." A superb climax! Disrespect to the state is bad, disrespect to religion is worse, but disrespect to William—*anathema maranatha!* Even the belongings of the Kaiser have a sacrosanct

quality. He has the insignia of his imperial power placed on the altar of a church in Königsberg, as if for adoration, and makes a speech on the occasion. But the most extraordinary of these discourses are those devoted to the Emperor's grandfather, a very ordinary person, who owed all his greatness to his Iron Chancellor. He almost regrets that William I did not live in the Middle Ages, for then "He would have been canonized, and pilgrimages would have been undertaken from every country on the globe to pray near his bones."

Mr. von Schierbrand has done his work admirably, but the absence of an index impairs the value of the book not a little. To send a person wading through it in search of some particular imperial diction is the height of cruelty. The volume is adorned with a good likeness of the Kaiser as he is to-day. He has no longer the greyhound-like slimness, the waspish waist, that gave a romantic glamour to his person some twelve years ago. He evidently has become decidedly stout—a fat Adonis. His waist is even more protuberant than that of the Venus of Milo. His cheeks are rather swollen also, and the lower half of the face is heavy. The impression is palpably Teutonic, but not particularly imperial.

A Gentleman of the South

A STORY of the Old South,* which begins with a feud between two families who lived in patriarchal State somewhere in Alabama, and ends with a duel in a cemetery over the grave of a mutual lady love. And, strange to relate, this is not altogether a fanciful situation invented by the author, but it really typifies the almost medieval

* A GENTLEMAN OF THE SOUTH. By William Garrott Brown. New York: Macmillan Company. \$1.50.

customs of the South before the war.

In fact, fiction dealing with this period must always seem more or less incredible to a later generation disciplined by a uniformity of social conditions. Love, hate, courage and eloquence were the dominant characteristics of these people. And a man found his social level not so much according to the list of his virtues as he did by his ability to demonstrate these attributes of a gentleman. There was no such thing as reality in the South in those days. People imagined everything and made life conform as much as possible to the exaggeration. They had nothing in their experience which corresponds to the literal sensations of the North, where energy and severer conditions long ago reduced even the mind to terms expressing only realities. Thus it is clear that the author who attempts to write a story of the Old South must do so only in the most romantic terms.

In the course of this tale everybody goes to Washington and shines, the men in the Senate chamber, the women everywhere. And in this the author again shows his intimate understanding of the spirit of the times. Especially in the old days the South showed a genius for social and political life. And at the time indicated by this story they gave to the life of the National Capital a sort of grandiloquent manner and a charm entirely Southern. And this was not difficult to do when we remember that everybody went to Washington who had the proper ancestral record to propel him into the political and social arena.

Incidentally every man belonging to this class either fought duels or held himself in readiness to fight. Dueling was a part of the heroic logic of the times, and grew out of the phenomenal self-esteem peculiar to the men of the South even unto this day. Each one raised himself to the sixteenth power of importance in his own estimation, and therefore had more to defend from the challenging impudence of the world outside. And each conceived himself to be under extraordinary obligations

to sustain the sword arm dignity of his reputation. It was a part of the general hallucination which governed the South at that time, and ultimately resulted in her defeat. And so Mr. Brown is historically accurate when his heroes end the tale with a duel. Whether it should have been fought in the family burying ground is a matter of taste. But as a rule gentlemen who fought duels in the South are said to have adjourned across the line into South Carolina. Precisely why this was the custom we are unable to say, but we have no doubt Mr. Brown will himself throw light upon the question in the course of his historical investigations. For after all has been said Mr. Brown is an historian rather than a novelist. He interprets faithfully, but his dramatic ability is by no means extraordinary. And come to think of it, the South is more in need of historians just now than of novelists. Let him give us another volume as good as his collection of essays entitled, "The Lower South in History." Besides, this "Gentleman of the South" has been used so often to further the interest of aspiring authors that he has become a sort of lay figure in Southern fiction. We have lost interest in his proud performances.

The Making of Our Middle Schools. By Elmer Ellsworth Brown. New York: Longmans, Green & Co., \$3.00.

The prodigious development of our school system well deserves the attention of the historian, and no part of it is of greater interest than that described in this book. The author allows himself much latitude; he does not hesitate to tell us many stories about the early teachers and patrons of education. While this matter is, strictly speaking, not indispensable, it gives a human interest to what could otherwise hardly escape being a dry chronicle of incorporations and schedules. It should be said, then, that the author disclaims the purpose of writing a systematic history. What he has attempted, and attempted very successfully, is an account of the intermediate schools, commonly known as grammar or high schools and academies, which have come to fill so important a

place in our system of instruction. He tells us of the grammar schools of England, of the colonial grammar schools, early and late, and of their teachers and what and how they taught. The English and American academies are also described. The movement for State control of education, which attended the growth of democratic sentiment, is considered at length. This movement has had many features of singular interest, and it is hardly less deserving of study now than when it first became conspicuous. The modern high school receives due attention, and chapters are given to the tendencies of the present time. We regret that we cannot review this valuable treatise at greater length. It is the product of extended investigation, and the enthusiasm of the author makes it pleasant reading. Teachers in our public schools will consult it with profit.

Belgium and the Belgians. By Cyril Scudamore. New York: E. P. Dutton & Co., \$2.00 net.

Mr. Scudamore gives a well arranged and interesting account of Belgium. Tourists in particular will find much of value in his descriptions of the scenery in the provinces of Liège, Namur and Luxemburg. He has gathered a great deal of information regarding education, government, politics and industry in the Flemish Kingdom, and to this has added his personal impressions of the life observed there. Wages and salaries, both in public and private employment, are low, but necessary expenses are moderate, and the people, high and low, are thrifty, except for a too great expenditure for drink. Of the several racial stocks the Flemings are by far the most numerous. There are two types of these, one tall and long-faced, the other short and round-faced. Both are Teutonic. The Walloons also show two types, the darker indicating a pre-Aryan origin and the other Celtic. Belgium is increasing rapidly in population, and its industry and agriculture are steadily advancing. Co-operation among the urban workers is farther advanced than in any other country. A chapter on the political situation, recounting the unremitting struggle for equal suffrage, the gains of the

Socialist party and the losses of the Clerical party, is contributed by a member of the Brussels bar.

The Song of the Cardinal. By Gene Stratton-Porter. Indianapolis: The Bobbs-Merrill Co.

A more delightful love story has not appeared this year than *The Song of the Cardinal*, which is the courtship of a red-bird beau that lived and sung and flirted on the banks of a beautiful river somewhere this side of Florida. The tale is told with delicate sentimentality, which so far from straining ornithological facts is really founded upon an intimate and intelligent knowledge of bird-life. The unique charm of the story indeed comes from the manner in which the author has translated into romantic terms the authentic performances of a red-bird lover. Such books can be recommended not only on account of the pleasure they give but for the good they do. They contain the most convincing of all arguments against the vagrant cruelty of young sportsmen, because they give those touches of nature that suggest our kinship with these lovely folk of the trees.

Felicitas. By Felix Dahn. Chicago: A. C. McClurg & Co., \$1.50.

The scenes of this pretty idyl are laid in the Roman provinces during the fifth century, when they were overrun by Northern barbarians. While poking among the ruins along the old "pagan road" one day the author discovers a slab of marble which he concludes was once the threshold to the garden of an ancient villa, and upon which this legend was carved:

Hic habitat Felicitas
Nihil mali intret.

Wearied with his romantic excavations he falls asleep and dreams this story of the beautiful young wife "Felicitas" and her husband, who once lived in the villa. And a more delicate interpretation could scarcely have been made of a period famous in history on account of its frightful brutalities. The story is not without historical interest, but the charm of it lies in this admirable picture of innocence and happiness, amid the chaos of a fallen civilization.

EDITORIALS

The German Social Democrats

It is a notable victory, freighted with far-reaching consequences, which the Social Democrats have just won in the German elections. They have polled 2,911,317 votes, about double the number polled by the next strongest party, and an increase over their own vote of 1898 of about 800,000. They have elected at least 81 of the 397 members of the Reichstag, an increase of 23. They are entitled to a far larger representation than they receive, the unfairness of the apportionment bearing upon them with particular hardship. In 1898, for example, it required an average of 37,626 voters to elect a Socialist, and only 13,228 to elect a Clerical and 15,911 to elect a Conservative. On the average electorate of the four principal conservative parties the vote recently polled by the Social Democrats would entitle them to upward of 150 members of the Reichstag.

The German Social Democracy is an outgrowth of two working-class movements—those of Ferdinand Lassalle and of Karl Marx—antedating the creation of the Empire. In the first German election (1871) the Socialists polled 102,000 votes. In 1874 they increased this number to 340,000. In the following year the Gotha congress united the two movements, and at the election of 1877, 493,288 votes were polled. The attempts of Hödel and Nobiling on the life of Emperor William in 1878 brought about a terror of radical parties, and Bismarck caused the passage of severe anti-Socialist laws. Under the vigorous prosecution following the Socialist vote fell, in 1881, to 311,961. But the reaction was only temporary, for in 1884 the vote increased to 549,990, and in 1887 to 763,128. Three years later (1890) the vote leapt to 1,427,298. The anti-Socialist laws were repealed during the same year, and the party everywhere took on new courage. In 1893, on a vote of 1,786,738, it secured 48 seats in the Reichstag, and in 1898, polling 2,107,076 votes, it won 56 seats, afterward in by-elections winning two more.

This steady and amazing growth is variously accounted for. By Conservatives it is held to be due to an increasing opportunism in the methods of the party leaders; by the more extreme Socialists, on the other hand, to the resolute keeping before mankind of an attainable ideal of human society. We are inclined to think that the critics of Socialism have in general misrepresented the party's more recent methods. That the leaders have made party capital of present issues is undoubted. They have shown an increasing interest in questions of social and political reform, and to some extent have abated their revolutionary attitude of a few years ago. The recent platforms of the party called for such diverse remedial measures as the following:

1. One vote for every adult, man and woman; a holiday to be election day; payment of members.
2. The Government to be responsible to parliament; local self-government; referendum.
3. Introduction of the militia system.
4. Freedom of speech and freedom of the press.
5. Equality of man and woman before the law.
6. Disestablishment of the churches.
7. Undenominational schools, with compulsory attendance and gratuitous tuition.
8. Gratuitousness of legal proceeding.
9. Gratuitous medical attendance and burial.
10. Progressive income tax and succession duty.

These are not the whole of the immediate concerns of the Social Democratic party. Generally, it may be said that on every pressing issue of modern politics the party develops an attitude which it sustains on its platform and in its press, and the discussion of which often temporarily throws into the shadows the revolutionary ideal.

But one would be mistaken to say that the revolutionary determination is any the less an integral part of the movement. The ideal of a co-operative commonwealth is the beacon by which the movement is guided. The concessions that are made to present-day needs are made because of the belief that they aid in the attainment of the desired goal.

The general attitude toward remedial measures has changed, but not the attitude toward the ultimate reconstruction of society. The Berlin congress in 1892 declared:

"What can be got for workingmen by parliamentary work is a mere *viaticum* to sustain them on the march forward, a mere installment which serves to furnish the proletariat with a little more of the means of battle which they require in order to fulfill their historic mission."

It is true that a conviction that legislative reforms are something more than "a mere *viaticum*" has gained ground in the party ranks during the last ten years; but the growth of this conviction has tended in no respect to obscure the "vision of the world" with which all their policies is illumined. In the manifesto with which the party opened its recent campaign there is this most radical declaration:

"Our aim is the establishment of the Socialist state and social order based upon collective ownership of the means of production and the duty of all to labor—the establishment of a political and social condition in which truth, justice, equality and the common welfare shall be the sure rule of conduct for all. Voters, you who agree with us in these ideas, vote on June 16th only for the candidates of the Social Democratic party."

That all the voters of the Social Democratic ticket are not Socialists is indubitably true. Thousands of them are led to its support from the fact that it serves as the most effective means of protest against the militarism and autocracy of the Emperor, other thousands because it promises some measure of resistance to the exactions of the Agrarian League, and still others because of its social and industrial demands. To many of these the ultimate aim of the party is of small concern. And yet it is from these lukewarm auxiliaries in each campaign that the subsequent recruits to the regular organization have been gained. It would seem that, at least in Germany, to paraphrase Pope, Socialism is such a monster that it needs only to be seen to be hated; and yet seen more often, it is first endured, then pitied, then embraced.

The immediate effect of the elections may be but slight. The Conservative groups are still in the saddle. But the

defeat of many of the Agrarian leaders will probably cause a reduction in the food tariffs, which prove so burdensome to the German people, and the Socialist increase will probably strengthen the opposition to the enormous expenditures for the army and navy, and at the same time promote the passage of a number of remedial measures in behalf of labor. Among the indirect effects will be without doubt an alarming growth in Socialist propaganda throughout Europe.

Can We Spare the Old Men?

KNOWLEDGE is new, but wisdom is old. It is not an exaggeration to say that until the nineteenth century the world had little knowledge. Most of the theories which were accepted as scientific no longer ago than the age of Benjamin Franklin have gone forever to the rubbish heap of ridiculous things. But thousands of years ago the world had attained wisdom, and perhaps it cared more for wisdom then than it does now.

Knowledge has been acquired with immense difficulty, for nature has kept her secrets well. Only to that research which has been endlessly patient has she disclosed some few glimpses of her infinite stores of truth. Wisdom is born of life. It is not to be obtained in laboratories nor by scanning the heavens. Man gets it only through actual experience of the struggle for existence. A man may have knowledge and remain a fool, and an age which rejoices in its astounding command over the processes of nature may be without judgment.

There is too much reason to fear that this twentieth century, which is vaunting itself over all the ages of the past, is trying to make knowledge and enterprise take the place of ripe wisdom. No one can compare any modern work of man with corresponding work of earlier times without admitting that the modern product is crude or tricky. It is a shameful confession for a scientific age to have to make, nevertheless it must be made, that there is but little honest workmanship in any industrial art or trade today, and that strictly honest goods have practically disappeared from the markets of the world. An Iroquois mocasin and a Navajo blanket are gen-

uine things. A machine made shoe with scrap filled soles and "all wool" dress goods grown on a cotton plantation are toilsomely fabricated lies. And even where deceit is not worth while, there are haste and indifference to true standards and ideals in a majority of modern activities. To go fast, to accomplish what looks like a vast result, to make a big show, to hustle and puff, and look as if you were a portentously busy fellow—this is the modern notion of working and living. The man who cares for the quality of his work, who loves to linger over it patiently, finding satisfaction in the thought that he is doing every bit of it in exactly the right way, is one for whom the world seems to have but little use.

We suspect that there is a close relation between all this modern crudeness and the brutal disregard for age which is being manifested in every employment and profession. Where to-day does one see in trade, in business or in the professions the dignified man of ripe experience who has laid by stores of wisdom and who could impart to younger men those traditions of painstaking method which youth is proverbially impatient of, but in disregard of which no really worthy work has ever yet been achieved? The conductors on our trolley cars are youngsters who haven't yet grown beyond the age at which boys think it is smart to treat their betters roughly and to say impertinent things. Salesmen and saleswomen, with few exceptions, are of the age which assumes that elderly gentlemen and gray-haired ladies should thankfully receive advice about their most private personal possessions and habits, and which cultivates the habit of punishing unappreciative customers by a chilling inattention. In brokers' offices, in banks and in great manufacturing establishments practically all work is carried on by young fellows, unable to conceive that they might learn something from men of longer experience, and who are thankful when some faithful gray-haired employee is dismissed to make room for one of the younger lot.

The saddest state of affairs is found in the professions, and especially in those which in one way or another have the making of public opinion. Every little while some one asks why there is no

great newspaper to-day. Time was when the *Tribune*, the *Sun*, the *Times*, the *Evening Post* and the *Springfield Republican* helped to make history. Their opinions counted for something. That was when their editorial pages were controlled by men of ripe experience. Greeley, Dana, Raymond, Godkin and "Sam" Bowles were men of unlike minds and of different characters, but they had one qualification in common. They had lived. They had stored up experience. They were not kids. The modern newspaper is without influence because it is a product of the kid mind.

In the universities the state of affairs threatens to become even worse. The modern university president has become infected with the business way of looking at things. He thinks he is running "a plant" like a cotton factory or a barbed wire mill, and must turn out a certain number of intellects of assorted sizes every June. For this work he needs a lot of young hustlers in the professors' chairs, who can do business on the "step lively" plan of the trolley car conductor. And as to the ministry, it is only necessary to recall the oft bewailed "dead line of fifty" years, beyond which the clergyman's usefulness is supposed to end. Indeed, there would almost seem to be no suitable place in the world's work to-day for the man over sixty unless it be the Supreme Court of the United States.

The whole situation, we say, is a sad one. It is sad because it reveals an utter failure to discriminate between the pretentious things and the real things in human life. It is sad because the results will be more and more destructive of quality, of manner, of appreciation of the sound and the beautiful, which only long years of hard experience can reproduce. When we have learned to desire sound goods, careful workmanship, judicious decisions, considerate treatment of patrons—in short, wisdom, rather than humbug, pretense, "plunging" and "hustling," we shall again have in the employ of corporations, in the newspaper offices and in the universities men of age and experience. Young men must do most of the world's hard and active work, but there is work which they are incompetent to touch. An age which

knows the difference between wisdom and knowledge will retain for that work the men who are competent. Wherever manner and quality are still in demand, wherever real goods are still sold, the man of experience is found.

✱

The Carlyle Scandal

WE are glad to print this week a communication from Mr. Andrew Lang which goes over the Froude-Carlyle dispute with convincing clearness and authority. As we pointed out in our review of the "New Letters and Memorials of Jane Welsh Carlyle," the attempt of the editors of that book to throw discredit on Froude was perfectly futile. Numerous errors in detail may undoubtedly be found in Froude's four volumes, but in the main his portrait of Carlyle was veracious, and it will endure. Certainly his procedure in the whole vexatious affair was candid and honorable. But Mr. Lang makes no allusion to the latest phase of the dispute, and we feel compelled, against our taste, to add a word of comment. It would be pleasanter to pass the matter over in silence, but the scandal is abroad and will be repeated everywhere despite any protests. It is also true that silence might be taken for acquiescence in the disgusting story.

Some time ago the daily papers printed extracts by cable from a pamphlet issued by Froude's "representatives," Ashley A. Froude and Margaret Froude. This pamphlet has now been thrust under our nose; we have read it, and wish to save others that annoyance. The pamphlet is printed from pencil notes left by Froude, but shown to no one during his life. Most of it is of no importance; the only part that demands attention is contained in the following quotations:

"This was one of the Cheyne Row secrets which was the cause of so much heart-burning and misery. But it was not all. Carlyle's mysterious allusion evidently did not refer to anything connected with Lady Ashburton. I am not sure that I know now what he meant; but a mystery was communicated to me, if I can call that a mystery, which was forced upon me from the study of the papers—some-

thing which I would infinitely rather have remained in ignorance of, because I could not forget it, because it must necessarily influence me in all that I might say, while I considered I must endeavor if possible to conceal it."

"When she [Miss Jewsbury] heard that Carlyle had selected me to write his biography she came to me to say that she had something to tell me which I ought to know. I must have learnt that the state of things had been most unsatisfactory; the explanation of the whole of it was that 'Carlyle was one of those persons who ought never to have married.' Mrs. Carlyle had at first endeavored to make the best of the position in which she found herself. But his extraordinary temper was a consequence of his organization. As he grew older and more famous he had become more violent and overbearing. She had longed for children, and children were denied to her. This had been at the bottom of all the quarrels and all the unhappiness."

We cannot say less of the publication of the pamphlet than that it is a cruel error of judgment and an offense against decency. It is an error of judgment because its tendency will be to throw discredit on the whole portrait which Froude has given us of Carlyle; and that, of course, is precisely what Froude's representatives least wished to do. That in such a matter Froude could have placed confidence in the story of a meddlesome, unwholesome and untrustworthy woman like Miss Jewsbury, who manifestly—granting her honesty—has misunderstood the situation, is an imputation against his right to act as biographer at all. No one with any proper understanding of human nature should have taken her tattle seriously. The rest of the unfortunate pamphlet adds no proofs to this gossip, and calls for no account. The only other point of any significance is an absurd inference in regard to the relations of Carlyle and Lady Ashburton:

"A fresh light was thus thrown on the Lady Ashburton affair. Intellectual and spiritual affection being all which he had to give, Mrs. Carlyle naturally looked on these at least as exclusively her own."

This is merely grotesque.

The pamphlet is an offense against decency. If the charge were proved, there might be some possible excuse for publishing it. But to spread

abroad such an imputation on such slender evidence is utterly unpardonable. It is no excuse for the representatives of Mr. Froude that they were goaded to the act by the silly attack on Froude in the introduction to the "New Letters and Memorials." We regret sincerely that one of the best and most high-minded of our publishing firms should have lent their imprint to the pamphlet. It does not rebound to their credit.

In the end we can only say that Froude's original portrait of Carlyle holds good, despite the slur on his judgment from this ill-advised publication. Every man of upright judgment will hope that the matter may end here.

The Influence of Commerce

DENUNCIATION of the commercial spirit is not a new thing. As long ago as 1837 Rev. Dr. Channing was writing:

"Our present civilization is characterized and tainted by a devouring greediness for wealth."

Harriet Martineau, who was one of the best observers of her age, and a cotemporary of Channing, wrote:

"The activity of the commercial spirit in America is represented abroad, and too often at home, as indicative of nothing but sordid love of gain, a making haste to be rich, a directly selfish desire of aggrandizement. This view of the case seems to me narrow and injurious. I believe that various energies, some nobler and some meaner, find in commerce a center for their activities. I have studied with care a variety of persons engaged in commerce and have certainly found that a regard for money is a more superficial interest than many others."

She argues that American commerce is characterized first of all by enterprise; second, by a love of distinction; third, by a love of novelty and art; but, above all, by a human eagerness for accomplishment. She knew men of business, whose activity had made them wealthy, who would not care if they lost every dollar they had.

"They knew themselves well enough to see that the pleasure was in the pursuit, and not in the dollars."

If the most liberal institutions in the State were examined, it would be found "how active the merchant class has been, beyond all others, in their establishment." The argument was very good for the time in which Miss Martineau lived; but the logic is just as applicable to-day. We believe that the commercial spirit, so far from being essentially sordid and selfish, has developed the largest benevolence and humaneness of the age. It needs but a careful reading of history to show us that traffic has been at the bottom of the civilizing process all the way from tribal life to internationalism. The impulse given to commerce by steam power and electricity has only increased its beneficent effect. We cannot afford to misunderstand the drift and the spirit of that expression of human evolution which is realizing the fact that all men are neighbors.

The eighteenth century was characterized specifically for its continuous struggle for freedom of commerce—a struggle that ended in the Declaration of Independence. We fought our Revolutionary War nearly as much for free trade as for personal freedom. Our second war, that of 1812-14, was not unlike the first in motive. England's Orders in Council undertook to compel American carrying ships to pass through a British port and pay port duties. Napoleon issued counter edicts, that any vessel paying such duties should be seized as substantially British and be condemned. Our commerce was at the mercy of these European belligerents. The Treaty of Ghent, whatever else it failed to do, established the great principle of commercial neutrality on the high seas. In 1838 three steamships crossed the Atlantic. The impulse to commerce was astounding. But it at once became necessary to reform in all directions. Postage must be reduced, so that people could do business with speed and ease. Travel followed trade, and the Cunarders were on the ocean in 1841. Then came the telegraph, and in 1866 a cable under the ocean. Commerce had already sent Commodore Perry in 1844 to break open the sealed doors of Japan, and to begin that expansion of

international fellowship which now dominates the globe. An "Open Door" began to turn, on somewhat creaking hinges, in the Orient. It became impossible any longer to sustain the old ethical idea that a nation can do as it pleases with itself any more than an individual. Every island must become a part of the world's commercial system. We were preparing the way for the absorption of Hawaii and the liberation of Cuba. "The field is the world." There was in all this no selfishness, but an enlargement of the spirit of fellowship and co-operation of humanity. The oceans were becoming a vast republic—governed by the common law which is concentrated and epitomized in the Golden Rule.

The history of English commerce has been, in the main, as honorable as that of the United States. When in 1806 Napoleon issued edicts debarring English goods from the Continent, it was English commerce that fought him single handed and established its right to freely trade where it would. Russia yielded to England, and the Moscow campaign followed, which led to the obliteration of Bonaparte from European politics. It was English commerce that, in the thirties, demanded and secured the abolition of the Corn laws, and incidentally brought about the enlargement of suffrage in the manufacturing towns. Commerce never had a vote to cast against the elevation and protection of labor. There are very few scars on the history of commercial traffic during the nineteenth century—at least after the Treaty of Ghent. But it was more particularly by the enlargement of view, the widening of relations, the bringing of classes, nations and races together that commerce operated to create humane sentiment and bring about the betterment of humanity. Race prejudice gradually broke down; Catholic and Jewish emancipation followed in England, and negro slavery was doomed in America.

Commerce owns the steamships of the world; the railroads and the telegraph. It cannot be denied that, on the whole, it has made good use of them. It has taught us that we are interested financially in making all classes and all people good

buyers—that is, in ameliorating the conditions of mankind in every quarter of the globe. As the ramifications of peaceful business widen and surround the globe, taking in not only Europe, but Africa, and Asia, and America, and the islands of the ocean, international commerce assumes a dictatorial tone. It says, You shall not fight; you shall not disrupt the business of the world. Commerce does not love war. The wars that have been waged for the extension of commerce have been merely the eddies in the stream. It is bringing about a fusion of right and righteousness—of commercial duty and religious obligation. To commerce, more than we have been ready to believe, has been intrusted an important part in the duty of making the world just, honest, humane and equitable. Do unto others as you would they should do unto you becomes international law. Not the United States against all the world, but the United States for all the world is our new political economy. The tendency of commercialism is toward co-operation and combination—toward internationalism and humanity. It demands a chance for free competition in the world's markets; and it will enforce its demands. Peace conferences are a sign on the road we are traveling. Over the rulers, over the world, presides a new power—the power of international exchange, and ultimately it will have reduced warring to peace, and have beaten the sword into plowshares.

Needed Improvement in Mission Methods

Not a few students of foreign mission methods believe they can be improved. Let us take Japan as an example.

First, as to men. What is the condition? City after city in this Empire is manned with three, four or five missionary families, often plus single ladies, where one or two would be sufficient, thus releasing the others for centers with no foreign resident. Why? Simply because the city is a "strategic center" and "denominational interests" require the overlapping. There is one city of less than 50,000 people, where three separate varieties of Methodists are working.

Why not remove two of these families elsewhere? Japan to-day needs not so much more men as it does an intelligent disposition of the force now on the field, tho surely men of the right caliber are demanded.

Second, as to money. Japan should have one strong Christian university. No single Mission Board is rich enough to co-operate with Christian forces in the Empire to establish such an institution. But if Presbyterians, Baptists, Methodists and Congregationalists should pool their educational resources Japan might have its Christian university, together with four or five excellent preparatory schools doing a unique service for the nation. Just this is being accomplished in China. Dr. Neesima and his Doshisha are household words throughout the land. So powerfully has this educational institution taken hold of the affections of Christian Japan that to-day in its governing bodies no less than five denominations are represented. Its President is both the most honored Presbyterian layman in the Empire and the Speaker of the Lower House of the Imperial Diet. Two of its trustees are Episcopalians. On its teaching force it numbers two Presbyterians, one Methodist and one Baptist. One trustee may be considered a representative of those inside of church membership, while the larger number, both of its faculty and Board of Trustees, are Congregationalists. Nothing has been done to force this condition. It has come about naturally in the development of Christianity here. Why should not the churches of all denominations at home, by a generous policy of large endowment, make this the great Christian center which it might become?

There is a demand in Japan for one great Christian university, with its related preparatory schools here and there over the Empire. The Doshisha and other Christian schools constitute the well laid foundation for such an enterprise. The Governmental system cannot cover the ground. Such institutions as Count Okuma's Waseda University and the Keio Gijiku, not to speak of the annual turning down of hundreds of bright young men for lack of accommodation in the higher schools, make it evident

that a well equipped Christian plant would attract large numbers and contribute an element of power which Japan greatly needs to-day.

But this is only one item under the head of financial consolidation. The economies of combination are manifold in the field of self support for churches or of the employment of native agencies. Witness the present waste of money in Christian periodicals, each with its tiny band of subscribers in place of one or two thoroughly alive, aggressive, comprehensive and well supported publications.

What has been accomplished already in the line of consolidation gives good hope of reaching the ideal. Presbyterially governed churches in Japan have for years marched in solid column. The many banded Methodists will doubtless soon wear the same uniform and fight under one banner. A Committee of Co-operating Christian Missions is at work drawing closer the cords of united effort. All Protestant denominations except the Episcopalians will begin to sing out of one book before the end of 1903, and even the defenders of Apostolic succession have consented to join with other Christians in praising God unitedly in terms of 150 hymns. All this is good, "very good."

But there can be advance. If Methodists and Presbyterians in Canada and Presbyterians and Congregationalists in Australia can combine, why not all three in Japan? If three, why not more denominations? Where is the rub? Chiefly in the Mission Boards and the Churches in America. Let us bring the truth home; the difficulty is there. To the credit of our missionaries be it said that the fault is not theirs.

Some day the great Trust principle will invade the churches as it has the realm of commerce. The business men in our home churches control the situation. Let several hundred leading laymen in each denomination get together and say, "The era of sectarian mission enterprise must close," and the beginning of the end is nigh. There is a handwriting on the wall in the remarkable development of lay enterprise in the Church. What means the Young Men's Christian Association and the capture of positions of responsible oversight in so

many of our Mission Boards by laymen—positions once held only by clergymen? Does not all this presage business methods in the conduct of the business of the Church? When the modern business man takes hold the sect must go; all such ancient and musty history as ecclesiastical individualism, theological hair splitting and close communionism will be relegated to its appropriate "dark backward and abysm of time," and the Church will awake to its business of bringing men into personal touch with the Living Christ the world over.

Lynching by Fire in Delaware

Only a few years ago lynch law was for the first time in this country administered by burning a negro at the stake. That was in Texas. Within the last month this awful and barbarous punishment has been inflicted twice by mobs in the North—in the first instance, for murder, in Belleville, Ill., and in the second, for rape and murder, only thirty miles from Philadelphia. We should like to think that argument against these brutal and demoralizing exhibitions is unnecessary for the restraint of the intelligent people of any American community; but we remember that the blood of the victim of George White's atrocious assault was shown from the pulpit of a Wilmington Presbyterian church on the evening before the burning of this negro, to emphasize a sermon in which the people of Wilmington were indirectly incited to the violence of which a considerable number of them were soon to be guilty. The most effective agent for the prevention of such awful crimes as that which the Wilmington negro committed is a stern and speedy enforcement of the law by the courts and the sheriff, with all the solemnity which the act requires. Lynching is not a deterrent with respect to the universally abhorred crime in question. At all times, and especially when it is accomplished by such public torture as burning at the stake, it is intensely demoralizing, degrading and uncivilizing to the community in which it occurs, and indirectly to the entire nation of which that community is a part. In this way the untutored savage satisfies his desire for revenge and his thirst for blood, but

even he does not take fragments of bone from the ashes of his enemy and treasure them up for exhibition as mementos of a notable event in which he was interested as actor or spectator. Just punishment can be inflicted more effectively under the law. It should be inflicted promptly. The judges at Wilmington erred grievously in declining to take measures for the speedy trial of the murderer of Miss Bishop. A month ago, in Texas, where lynching by fire was first practiced, a negro guilty of an assault like this one in Delaware was rescued from a lynching mob by the authorities, tried, convicted, sentenced and decently hanged, all in the four days immediately following his offense. It is of the greatest importance that in all such cases the forms and rules of law should be observed. Such promptitude as marked these legal proceedings in Texas would have saved Delaware from disgrace.

Postal Service Prosecutions

The President's letter to Mr. Knox, with the appointment of Mr. Bonaparte and Mr. Conrad as special counsel, shows that it is Mr. Roosevelt's purpose to uncover, if possible, all the rascally work that has been done in the Post Office Department, and to bring every one of the rascals to justice. But as to the existence of this purpose no special evidence was needed. Everybody possessing ordinary intelligence has known that the attitude and action of the President with respect to any matter of this kind could be predicted with absolute certainty. It will be observed that the two special assistants are not only to deal with indicted men but are also to "examine into all the charges that have been made against officials in the postal service," with a view to the prosecution of "all guilty men, whether in the service or not," provided that the successful prosecution of them is not barred by the statute of limitations. Bearing in mind the character and righteous impulses of Mr. Bonaparte and Mr. Conrad, we are confident that they will not permit their examination to be restricted in any case by a hasty assumption that prosecution is barred by the statute, and that some scoundrels will not escape exposure even

if the law cannot now be enforced against them. This selection of special counsel is admirable in every way. Mr. Conrad is a Democrat; Mr. Bonaparte is a Republican of notable independence, who cannot be restrained by partisan considerations from pursuing relentlessly any guilty Republican, even if the latter should hold a high place in the party councils. President Garfield was not less fortunate in the employment of Richard T. Merrick and William W. Ker, both Democrats, to assist in prosecuting the Star Route robbers; but at that time there was much more for the prosecutors to contend against in Washington than there is in these days, and partisan influence served to prevent the indictment and prosecution of certain persons who ought to have been punished. That was not so very long ago, but the prosecutors and the leaders of the defense in that memorable contest are dead. Those frauds were much more extensive than the thefts of Machen and the others who are now under indictment, and whose offenses, as measured by the pecuniary profits, may in comparison be called petty larceny. One lesson of the Star Route investigation and prosecution should be of service now: there is nothing to be gained by confining the inquiry and the pursuit to frauds of the immediate present or of a very recent date. The light should be let in, at least, upon all the dishonesty hitherto unknown that can be discovered. If the Star Route prosecutors had dug diligently in the mines of fraud and jobbery for the period just preceding the one to which their action was confined, the Republican party would by the inevitable exposure have been relieved of some burdens which for years afterward it continued to carry. It is true, however, that the mass of work to be done that related to the more recent period was so great that more assistants would have been required for the additional labor above suggested. At the present time the Government has an opportunity to turn the light upon all the dark corners in the postal service for a period covering several years, and incidentally, it may be, to restrict for the future the political activity of several persons whose presence hereafter in Congress or in places of prominence con-

nected with national political organizations cannot be beneficial to parties or the public.

The Democrats of Iowa

A controlling majority of the Iowa Democrats are able to perceive that the silver issue is dead, that the issue of imperialism cannot be made "paramount," and that a campaign cannot now be made successfully upon a platform that calls for the Government ownership of the railroads. The platform's demand for "the removal of tariff duties from all Trust-made goods" is one that, with some modifications, would seem reasonable to a considerable number of Republicans throughout the country as well as in Iowa. Many of these duties should be revised downward, if not wholly removed. But we perceive no profound public interest in this question at the present time. It may become a prominent issue next year. Reasonable opposition to the Aldrich Currency bill does not necessarily require the assertion to be made that it is designed to "foist upon the country an unstable currency based upon uncertain private securities" and "to give value and stability to the watered bonds of Trusts." It is noticeable that altho a resolution for Government ownership of railroads was rejected by a vote of 3 to 1, the platform contains a paragraph somewhat vaguely suggesting Government ownership of mines as a remedy for extortion on the part of the combined owners of such sources of supply. The vagueness of this paragraph is a serious fault. What are "the steps" which the Government should take for securing "an equitable distribution" of anthracite coal, for example, and how can they be taken with due regard for the Constitution?

Fourth of July Tetanus

During the next two or three weeks there will be, as there has been for every year about this time for more than half a century, frequent reports in the newspapers of fatal cases of tetanus. This is our annual Fourth of July epidemic of the disease. Cases will occur

mainly in children and young people, and will all have a similar history. During the setting off of fireworks for our noisily patriotic celebration of the Fourth some wound, usually not very severe, will be inflicted. This wound commonly heals without any hint of possible serious after effects. Some five to twelve days later, however, a stiffness of muscles is noted, usually beginning in the back of the neck or in the jaw, which spreads rapidly until, a day or two later, practically all the muscles of the body are affected. This is the dread tetanus or lockjaw, and is almost invariably fatal. As has been very well said by a distinguished authority in medicine, the first sign of stiffness in the muscles is not the manifestation of the beginning of tetanus, but the preliminary symptom of such serious involvement of the nervous system by the disease that death is almost sure to ensue. Physicians generally realize the conditions under which tetanus develops in these cases. Tetanus bacilli are almost constantly present in street dirt. When a wound is inflicted by a toy pistol or a blank cartridge the hands are usually soiled with this dirt, and some of the material is carried into the tissues. If the wound is entirely superficial and is not sealed up by the burning of the tissues the tetanus bacillus will not grow, for it is an absolutely anærobic organism and does not multiply in the presence of the oxygen of the air. It is clear, then, that parents and others need to take the greatest care with regard to such wounds, and especially should not hastily cover them up in such a way as to prevent the free access of air, since this is the most dangerous possible condition for them. On the contrary, free bleeding should be encouraged and the greatest amount of cleanliness should be exercised in handling them. As a rule, no wound inflicted at this time in the street should be considered as trivial. Even with the best of care some of them will prove serious, and any neglect of precautions may bring with it unavailing remorse. The annual death rate in our large cities from tetanus is about twenty to thirty per million of population. More than one-half of these deaths occur in connection with the celebration of the Fourth. It is said that in Washington, where

proper regulations as to the sale of fire-arms and ammunition to minors are enforced, the annual epidemic of Fourth of July tetanus is practically unknown. There is some hope, then, that if the police authorities of our cities take the question to heart there may be an amelioration of the present sad conditions.

The Canal Treaty at Bogota

President Marroquin, desiring that the canal treaty shall be ratified, sends to the Colombian Congress a message that is conciliatory and diplomatic. It may seem to us, here in the United States, that Colombia would surrender no essential part of her sovereignty by ratifying the pending agreement; indeed, one objection here to the treaty has been that it gives us insufficient control over the canal strip. In Colombia, however, the most weighty argument of those who would reject the treaty has been one based upon an alleged loss of sovereignty, and this explains those parts of the message which admit that the argument has force, altho it is outweighed by other arguments pointing to the advantages which Colombia must gain from the opening and use of the canal. Recent dispatches indicate, fortunately, that the treaty is approved by a majority in the Congress at Bogota. A change of sentiment appears to have been caused by the earnest and persistent efforts of members from Panama and of other prominent residents of towns on the isthmus and along the neighboring coast. The threat of secession has not been entirely without effect. While the action of the Colombian Congress may, and probably will, prevent any movement for the erection of an independent republic on the isthmus and along the adjoining coast, it is still possible that secession will present to this country a question of great importance. In view of this possibility it is well to recall the provisions of the treaty of 1846. By that agreement the United States "guaranteed positively and efficaciously to New Granada [and Colombia is entitled to the same guaranty] the rights of sovereignty and property which New Granada has and possesses in and over said territory," meaning the isthmus from its southernmost

extremity to the boundary of Costa Rica. Would a faithful observance of this treaty prevent the United States from recognizing and dealing with a new republic on the isthmus, if one should be successfully established there as a result of a rejection of the treaty at Bogota? It is a question not easily answered in advance. Our duty would be determined in some measure by the circumstances attending the secession and by the relations which should exist between the new republic and the republic adjoining it on the South. But it is a question which we may be required to answer.

Schley Redivivus It is a pleasure to note that ex-Secretary Long has so far regained his health as to be able to fight his battles over again in the columns of the *Outlook*. As a chief actor he can no doubt contribute much of value to the inside history of the Spanish War; but his present rehearsal of his principal contest—the Sampson-Schley controversy — adds nothing of interest to that happily defunct issue, except to show that the responsible head of the Navy had about all the bias that was ever charged to him, and that even now, when the events narrated seem about as far distant as the reprehensible behavior of Commodore Cleopatra at Actium, his judicial equilibrium still needs much trimming to get it on an even keel. Of course, the wo occasioned by the famous “retrograde movement” dispatch of Schley here touches the nethermost profundity of Tartarean gloom. It used to produce merely “anxiety,” but, on further reflection, Mr. Long now thinks it was the sole and efficient cause of “the darkest day of the war.” He plainly fails to recollect that even this raven blackness of official despair could not be named in the same week with the anguish which brooded over the souls of the bath house keepers and summer boarders of Nahant and vicinity when they successfully shrieked for fleets to protect them from the shells of the truculent Cervera. The ex-Secretary, however, has a saving sense of humor, and after the “darkest day”

remark he blithely concedes that “undoubtedly it is a fair criticism on the Department that Schley was not relieved at once and inquiry ordered. But it was not then known just what his situation was” (despite the darkness of the day), “and it was taken for granted that the Commander-in-Chief, Sampson, who was near at hand, would take proper action, as had he been senior in the service he probably would have done.” The funny part of this is that the criticism now called “fair” was bitterly resented by Mr. Long’s party when it was made, that Sampson’s “nearness at hand” consisted in being at Key West and on the other side of Cuba, and that the lack of seniority excuse for Sampson (in full and supreme command) was one of the very things which *his* particular adherents have always hotly repudiated. Meanwhile we fear that Mr. Long has not remarked the strong feeling now existing among other surviving participants in the drama itself that bygones had better be bygones; and that, on the whole, they would like to be permitted to continue the work of restoring ancient friendships with as little reminder as possible of an unfortunate interruption, for which he was not altogether irresponsible and which did neither the country nor the Navy a particle of good.

It is obvious that the promise of President Roosevelt to transmit to the Czar the petition of the Jews of America does not fall in the ordinary line of diplomacy. On the contrary, it very obviously lays the sender open to the retort that he might better attend to his own business. Were it not that we have supreme confidence in the ability of Mr. Hay to observe all the niceties of diplomacy in the transaction, we should feel impelled to deplore the President’s yielding to the pressure placed upon him. As it is there is every reason to feel confident that the Government will be able to act as an advocate for the rights of humanity without in any way lessening its influence among the nations of the world by an ill-considered or ill-contrived procedure

FINANCIAL

The Railroads in 1902

By the annual report published last week the statistics of the Interstate Commerce Commission are brought down to June 30th, 1902. On that date there were 202,471 miles of railway in the United States; the capital of the companies was \$12,134,182,694 (of which \$6,109,981,669 was in bonds); the number of employees was 1,189,315, against only 824,476 in 1897. Earnings, gross and net, have steadily increased since 1897, and dividends with them. Gross earnings in the fiscal year 1902 (\$1,726,380,267) show an increase of 60½ per cent. over those of 1895, the increase of net in the same period having been 74½ per cent. Prosperity has enlarged the dividends every year since 1897, from \$87,000,000 then to \$156,000,000 in 1901 and \$185,391,000 in 1902. In the year covered by the report, employees received in wages and salaries \$676,028,592, which equaled 60½ per cent. of the operating expenses. Since the year 1895 the increase in the number of employees has been 51½ per cent., and the increase in total of wages 51¾ per cent. Statistics for the year now closing, however, will show a considerable increase of the average daily pay. Owing to the higher wages granted (the addition having been not less than 10 per cent. on most roads) and the increased cost of materials and supplies, net earnings for the fiscal year now ending have only slightly exceeded those of 1902.

The Irving National Bank

THE Irving National Bank, of New York City, has just removed to "Sunnyside" in the Irving Building, on the corner of Chambers and Hudson Streets. Established in 1851, its first location was at 279 Greenwich Street. It removed shortly after to a banking house on the northeast corner of Warren and Greenwich Streets, from which point it has now removed to its present location. The first President of this bank was Mr. Edward H. Laing. He died soon after assuming office, and was succeeded in 1852 by John Thom-

son. On February 3d, 1862, John Castree became President pro tem., and continued in the office until January, 1876, when Isaac Odell undertook the management of the bank. John L. Jewett, Jr., became President in June,

New Building of the Irving National Bank

1877. Mr. Jewett died in October, 1890, and Charles H. Fancher, the present executive was elected to succeed him as President on October 31st of that year. Charles F. Mattlage and Samuel S. Conover were elected Vice-Presidents successively in 1897 and 1902. Benjamin F. Werner was appointed Cashier in 1901. On July 1st, 1865, the Irving Bank became a National Bank. Its capital was originally \$300,000. In 1857 it was increased to \$500,000, and on July 1st, 1902, it was again increased to \$1,000,000. The present capital of the bank is \$1,000,000. The surplus and undivided profits are \$1,072,619.33, and it has total resources of \$8,108,614.54.

Financial Items

THE Bowling Green Trust Company dividend of three per cent. is payable July 15th—not June 15th, as stated last week.

....The coupons and dividend of the Buffalo & Susquehanna Railroad Company and the coupons of the Gulf & Ship Island Company will be paid at the banking house of Fisk & Robinson, this city.

....It is announced that the four powder companies on the Pacific Coast will enter the new combination projected (with a capital of \$50,000,000) under the leadership of the Dupont Company of Delaware.

....The First National Bank of Morristown, N. J., of which Albert H. Vernam is President and J. H. Van Doren Cashier has declared a semi-annual dividend of five per cent. and an extra dividend of two per cent., payable July 1st.

....Negotiations for a consolidation of the National Bank of Commerce and the Western National Bank have been resumed, and the merger will soon take place. The new institution will be known as the National Bank of Commerce, and its capital will be \$25,000,000.

....Canada's new transcontinental road, to be known as the Trans-Canada Railway, will extend from Quebec to Port Simpson, on the Pacific Coast, a distance of 2,830 miles. Work upon it was begun some time ago, and the builders hope to have the entire line ready for business in 1907. It will parallel the Canadian Pacific, crossing the continent something more than 200 miles north of that road.

....The syndicate which has obtained control of the electric light and power companies of Baltimore intends to procure a great supply of power from the Susquehanna River. Plans for two power development plants, each of 50,000 horse-power, have been made. The transmission line will be about 35 miles long. It is expected that power for manufacturing industries will be furnished at very low rates.

....In his recent annual report the Prussian Minister of Railways says, with reference to the 365,000 employees of the railroads of the State: "My predecessor issued an order that every one participating as an agitator in Social Democratic movements would be peremptorily dismissed. The same course will be pursued by the new administration."

The year ending with March last was the first period of twelve consecutive months in which imports into the United States exceeded \$1,000,000,000, the exact amount having been \$1,001,596,683, against \$1,414,736,954 for the exports. Imports in one year had never been as much as \$500,000,000 prior to 1870, and it was not until after that year that exports exceeded that sum. The increase of imports in the year ending with March (about \$100,000,000) over those of the year preceding was due mainly to the larger receipts of materials used by manufacturers.

....Dividends and Interest announced:

Amer. Woolen Co., preferred, 1½ per cent., payable July 15th.
 Amer. Locomotive Co., preferred, 1½ per cent., payable July 21st.
 Amer. Car & F'dry Co., preferred, 1½ per cent., payable August 1st.
 Amer. Car & F'dry Co., common, 1 per cent., payable August 1st.
 Amer. Telephone & Tel. Co., coupons, 4 per cent., payable July 1st.
 Exploration Co. of New York, \$5.00 per share, payable July 15th.
 Wells, Fargo & Co., 3 per cent. and extra 1 per cent., payable July 15th.
 U. S. Mort. & Trust Co., 8 per cent., payable June 30th.
 Southern Pac. Co., various coupons, payable July 1st.
 Amer. Chicle Co., preferred, 1½ per cent., payable July 1st.
 Amer. Chicle Co., common, 1 per cent., payable July 1st.
 N. Y. & N. J. Telephone Co., quarterly, 1½ per cent., payable July 15th.
 Carman-Guanajuato Gold Min. Co., coupons, 3¼ per cent., payable July 1st.
 Missouri Pac. R'way Co., \$2.50 per share, payable July 20th.

INSURANCE

A Life Insurance Story with a Decided Moral

ALEXANDER J. BRADLEY was a very nice young man. He was exceedingly popular, not only with his friends but with his business associates. He represented a prominent concern as a salesman. The partners thought very highly of him, and there were other points in his favor, so that when he married Miss Florence May Victoria Forest his cup of happiness appeared to be quite full.

The young couple began housekeeping under the most favorable circumstances. Only those who have had similar experiences can understand with what infinite delight they first examined by dim candle light the cosy house which they purchased almost at the beginning of their married life. Oceans of sunlight and happiness flooded the two young lives. The delights of "making up" made even their little quarrels pleasurable.

There was one fly in the ointment. The young husband was not insured. His wife with strange perversity that has far too many imitators put off from day to day all discussion of this topic. She said it sounded gruesome.

Young Mr. Bradley was liberal with his money and saved but little. Now and then the matter of providing for his wife, should death unexpectedly overtake him, would occur and recur to him, but whenever he attempted to talk of Life Insurance with her it appeared so distasteful to her that the time finally came when he made no further attempts in that direction.

Upon one occasion Mr. Bradley took a sudden resolution and upon the spur of the moment insured his life for \$20,000 without consulting his wife. He had the policy sent to him at his business office, and took it to the head of his concern and explained the circumstances to him, requesting that he should retain the policy against the possibility of his death. The premiums were paid for Mr. Bradley by his employers and no cloud appeared upon his horizon, not even the size of a man's hand.

He had a charming personality, and in

consequence he did a constantly increasing trade and steadily advanced in the esteem of his concern. Upon one occasion he was exposed to a draft, and he reached home feeling rather depressed by his exposure. He thought little of it and expected to be better in a day or two. Unexpected complications set in, however, and pneumonia carried him off in three days.

The grief of Mrs. Bradley cannot be described. This, together with the preparations for the funeral and other matters connected therewith that required immediate attention, postponed her realization of what the death of her husband signified. Neither Mr. Bradley nor Mrs. Bradley, it should be noted, had any near relatives, so that it was about a month after the death of her husband before she came to a full knowledge of her pecuniary situation. When at last she had figured up the matter, it was perceptible even to her that ruin stared her in the face. In the overwhelming depth of her despair she sought the advice of the head of the concern where here husband had been employed. She told him frankly of her unfortunate financial condition, and finished the recital with a flood of tears. Her husband's old employer was greatly affected. Excusing himself for a moment, however, he went to his safe, obtained the policy for \$20,000 that her husband had intrusted to his care, and returning with it explained to her what her husband had done. When Mrs. Bradley realized the full significance of the transaction and knew that instead of being without any resources she had what to her was a considerable fortune, she felt at peace with all the world, and understood the beneficence of life insurance as it would have been impossible for her to do without an object lesson such as is here described.

This little story is by no means all fiction. It symbolizes what has happened before and is likely to happen many times again. It is intended in a modest way to teach those who may not know, and to instruct those who are inclined to neglect to use the knowledge they may have until it is too late.

Survey of the World

The Tariff in Iowa

Owing to differences of opinion in the Republican party of Iowa concerning the tariff, and the frequently expressed desire of Governor Cummins for a revision of those duties which affect Trust products, the recent Republican convention at Des Moines excited much interest throughout the country. Governor Cummins, Lieutenant-Governor Herriot and several other officers were renominated by acclamation, but the tariff and Trust paragraphs in the platform—the result of repeated conferences between the representatives of the Governor and those who oppose his radical views—differ very perceptibly from the platform of the preceding campaign, which permitted the inference that certain duties were a “shelter for monopoly.” These paragraphs, however, had been accepted by Governor Cummins, and he declared that they supported his position. They are as follows and are preceded by an emphatic defense of the protective policy:

“Tariff rates enacted to carry this policy into effect should be just, fair and impartial, equally opposed to a foreign control and to domestic monopoly, to sectional discrimination and to individual favoritism; and must from time to time be changed to meet the varying conditions incident to the progress of our industries and their changing relations to our foreign and domestic commerce. Duties that are too low should be increased, and duties that are too high should be reduced.

“We believe that the large corporations commonly called Trusts should be so regulated and supervised, both in their organization and in their operation, that their evil tendencies may be checked and their evil practices prevented. In many instances they are efficient industrial instruments and the natural outcome of an inevitable process of economic evolution. We do

not desire their destruction, but insist that they shall be so regulated and controlled as to prevent monopoly and promote competition, and in the fullest sense subserve and advance the public good.”

Reciprocity was approved “as the natural complement of protection.” The platform opposes “all legislation designed to accomplish the disfranchisement of citizens upon lines of race, color or station in life,” and calls for the unanimous nomination of Mr. Roosevelt in 1904. In accepting his renomination Governor Cummins said that in the future he should maintain the tariff views which he had expressed during the past two years. He found in the platform (which he praised) a recognition of them and a warrant for his course. Representatives Lacey and Cousins defended the present tariff law, the former saying that he was a “stand-patter from Standpattersville,” and the latter commending the courage of the President and Mr. Hanna, who “in the face of cheap blustering sectionalism” advocated the policy of “holding fast to that which you know is good until you are sure of something better.”—It is understood that Mr. Cannon, of Illinois, who is to be Speaker of the House, opposes any currency legislation on the lines of the Aldrich bill.—Mr. John Barrett, formerly Minister to Siam, and now Commissioner of the St. Louis Exposition for Asia and Australasia, has been appointed Minister to the Argentine Republic.

Independence Day

The old town of Huntington, on the north shore of Long Island, celebrated its 250th birthday on the Fourth, and President Roosevelt was

the orator of the day. His address was in the main a repetition of the most striking parts of the addresses which he made during his Western tour, on good citizenship, patriotism, the civil war, the enforcement of law, the need of a first-class navy as insurance for peace, the lessons of the downfall of republics in former times, etc. The following passage excited much applause:

"This is not, and it never shall be, the government of a plutocracy. It is not, and it never shall be, the government of a mob. It is what you men [the Grand Army veterans] warred that it should be, and what in the future it shall be—a government of liberty and of order by, through and under the law, the law which no man is above and none is below, the law which forbids a crime of greed or cunning and which forbids equally a crime of lawless physical violence."

In the evening there was a fine display of fireworks on the President's grounds at Oyster Bay.—In Washington, a parade of soldiers, sailors, marines and the local militia was followed by a public meeting on the White House lawn, where the French Ambassador, M. Jusserand, made an eloquent address, eulogizing the revolutionists of 1776, referring to the aid given by France, and closing with these words:

"Endowed with institutions similar to yours, pursuing similar aims, we intend to vie with you, no longer on the battlefield, in pursuit of a liberty which has been won forever, but in constant attempts to improve the condition of the many, to spread the spirit of brotherhood between men and between nations—to remain, in a word, true to the principles proclaimed in your revolution and in ours. The fight for better things is an endless one. We shall fight it, you and we, with eyes fixed on the same ideal, the very same marked out by our ancestors long ago, and our flags will move on always toward the light; and while we follow them we shall be pleased to remember that if their designs are different, yet they display over our heads the same colors."

Secretary Moody denounced mob violence, which, he said, "renders our voice feeble when raised against oppression elsewhere." The postal service frauds were evidently in his mind when he declared that "no disease of the body politic" was "so subtle, so powerful, so dangerous, so fatal, as the

corrupt betrayal of a public trust." When the malignant ulcer of corruption appeared, "the knife should reach under every poisonous root of it." Charges should be investigated with the cold impartiality of a court of law. "If the offense be proved, let the displeasure of the people come like a thunderbolt from on high. Let not the hand of justice be stayed, or its edicts be tempered with a misguided mercy."—At Tammany's celebration, in New York, the chief orator was ex-Senator Charles A. Towne, of Minnesota, who denounced the war upon the Filipino insurgents and what seemed to him to be "on every side a veritable carnival of special privilege." Senator Bailey, of Texas, remarked that if others had exemplified the principles of 1776 as Tammany had, "the country would not be scandalized to-day by the sight of a Government Department honeycombed with petty theft." Mr. Bryan (whose name was cheered for five minutes) sent a letter deploring the "thirst for power and greed for gain which are leading so many of our countrymen away from political and private virtues." Mr. Cleveland's letter spoke of Tammany's "vast influence and glorious traditions." Ex-Senator Hill wrote that in his opinion a political revolution was at hand, partly because "the signs of the times indicate a growing popular distrust of the spectacular performances, the self-advertising methods, the contradictory professions, and the fickle, demagogical and dangerous tendencies of the present National Executive."

Contracts for Army Supplies

Secretary Root has ordered an immediate and thorough investigation of charges relating to contracts for certain army supplies that were manufactured at the works of Littauer Brothers, Gloversville, N. Y., the leading member of the firm being Lucius N. Littauer, Representative in Congress from the Twenty-fifth New York district. The evidence was disclosed last week in the course of a hearing in bankruptcy proceedings, the petitioner being Edmond R. Lyon, who was the successful bidder on many contracts for gloves and caps during the war

with Spain. Littauer Brothers manufactured the gloves, gauntlets and caps required for filling the contracts of Lyon, amounting to about \$200,000. According to Lyon's testimony the firm was interested in these contracts, dividing with him the profits of some of them and receiving a specified sum for each piece in others. Accounts and the letters of Mr. Littauer are published, which seem to support this statement as to a division of profits. Lyon has had no contracts for some time past and is now employed as a salesman. Mr. Littauer, who has for years enjoyed the friendship and confidence of Mr. Roosevelt, says that his firm had no interest in the contracts, but merely sold the goods to Lyon. The latter, he continues, ascertained what the firm's prices would be, put in his bid, and then, if successful, ordered from the firm the goods that he needed. The War Department knew that these goods were made by the firm. It appears that Lyon's bondsmen were Mr. Littauer's brother and brother-in-law. One purpose of the investigation is to ascertain whether there was a violation of the law which forbids a member of Congress to be interested directly or indirectly in contracts with the Government.—The War Department has decided that the law was not violated by Senator Redfield Proctor, of Vermont (formerly Secretary of War), whose marble company has had contracts for many thousands of headstones required for soldiers' graves. The company is incorporated, and the law permits a member of Congress to hold stock in a corporation that has contracts.

Postal Service Investigation

The Postmaster-General has given orders that none of his subordinates shall supply information to the press concerning the investigation now in progress. He has abolished the office of post office physician, the existence of which in the post offices of several large cities has excited much hostile criticism. Of the 1,776 promotions which Mr. Beavers, when Superintendent of the Division of Salaries and Allowances, directed to be made, only 806 have been granted. This reduction is said to have been caused by the inquiry as to the work of a "promotion syndicate." Contracts

for large numbers of a certain kind of clock, manufactured by a company in which New York politicians are interested, are now the subject of investigation; also the contracts for manifolded devices supplied by a company in which Representative Sibley, of Pennsylvania, is said to be the chief stockholder. Here again, as in the case of the money order blanks, the son of an influential subordinate officer of the Department is found to be an employee of the company. The contract for money order blanks has been awarded to Mr. Herman, the lowest bidder. It was for his attempt to prevent this award, in the interest of a bidding company by which his son was employed, that Superintendent Metcalf was removed. Further extension of the rural free delivery service will be made with great care, upon the reports of inspectors, and will not depend upon the requests of members of Congress.

Messages by the New Pacific Cable

The laying of the new Pacific cable was completed on the 3d, at Honolulu, and the line was ready for use on the night of the 4th. At 10.50 P. M. the first official message was sent by President Roosevelt from his office in Oyster Bay, to Governor Taft in Manila, as follows:

"Governor Taft, Manila: I open the American Pacific cable with greeting to you and the people of the Philippines.

"THEODORE ROOSEVELT."

Twenty-nine minutes later Governor Taft's reply was received. It was a long message, closing with a plea for a reduction of the tariff on Philippine products "in accordance with the broad and liberal spirit which the American people desire to manifest toward the Filipinos, and of which you [the President] have been an earnest exponent." Mr. Roosevelt then sent westward around the world a message of congratulation to Mr. Clarence H. Mackay, of the Commercial Pacific Cable Company, who was sitting by his side. This message started at 11.23 P. M. and made the circuit of the world in 12 minutes, going by way of San Francisco, Honolulu, Manila, Hong Kong, Singapore, Bombay, Suez, Malta, Gibraltar, Lisbon, the Azores, Cans.

and New York. Mr. Mackay's reply was sent eastward over the same route, and was transmitted in 9½ minutes. Among those who sent greetings to Governor Taft were ex-President Cleveland and Secretary Root. From St. Paul, Archbishop Ireland sent a brief message, one sentence of which was: "I hope that land negotiations with the Papal Delegate [meaning Monsignor Guidi] will soon be closed." At the same time he sent another message to Monsignor Guidi, as follows: "May success attend you in all things. How is it that there is so much delay in negotiations relating to the monastic lands? Here people are becoming impatient."

The Lynching of Negroes

At last week's convention of the Afro-American Council in Louisville, an address was issued in which it was pointed out that the provocations which lead to the lynching of negroes are becoming more insignificant and numerous, such punishment being inflicted even for impudence and disobedience. "Such conditions," says the address, "indicate clearly a tendency to anarchy; and anarchy for the negro will terminate in anarchy for all men."

"The number of those of our race who are now accused of the nameless crime against women is so small compared with the whole number that it is scarcely necessary to discuss this as a distinct crime. Yet we make no plea for any man who may be proved guilty of this crime; our plea is for law and for the protection of the innocent."

The Council does not object to "the disfranchisement of the ignorant negro, provided that the same classes of the other races are similarly dealt with." In an address before a large audience, Mr. Booker T. Washington advised his race to avoid extremes of utterance or action, and never to descend to the level of the mob. Recent outbreaks of mob violence, he said, had for his race this lesson: that "we should spare no effort to impress upon our people that idleness and crime should cease." The lesson for other Americans was: that there should be the same law and the same justice for black and white. "Whenever the nation forgets, or is tempted to forget, its basic principle, the whole

fabric of government for both the white and the black man is threatened with destruction."—At Montgomery, Ala., B. F. Cosby and George D. Cosby have pleaded guilty to a score of peonage charges and been sentenced to a year's imprisonment.—Five negroes were lynched in the South last week. At Scottsborough, Ala., the sheriff was shot twice while defending a negro prisoner against a mob. The negro was taken from him and hanged.—At Evansville, Ind., on the 5th, a race war was in progress. A negro killed a policeman on the 3d, and the mob attempted to take him from the jail. He was conveyed to Vincennes for his own protection. Afterward the mob attacked many negro residents of the city. A company of armed negroes for a time paraded the streets, but was then forced to disperse. There was great disorder through the night of the 5th, but on the following day peace was restored.

Labor Questions

The controversy between the builders in New York and their employees, who are organized in 41 unions, appears to have been settled by an agreement that provides for arbitration. Owing to the conciliatory efforts of the Civic Federation, a conference was held, and the arbitration plan proposed some time ago by the association of employers was unexpectedly accepted, with some modifications. This association, which represents more than 1,000 firms, had set out to eliminate the walking delegate and to prevent sympathetic strikes. In the course of its campaign, two walking delegates were arrested for blackmail and extortion, and it is said that it obtained evidence against a dozen more. The plan, which representatives of the unions have accepted, provides for arbitration in each trade, with the right of appeal to a general arbitration commission representing the entire industry; and the arbitrators chosen by the workmen are not to be walking delegates. Strikes and lock-outs are forbidden. One building company (the largest in the city, and not included in the association) had already made terms with the unions upon the basis of a similar plan of arbitration, which does not, however, it is claimed,

exclude from the arbitration boards the walking delegates of unions not directly involved. This controversy has caused a suspension of work for two months on buildings representing an investment of \$90,000,000, made 125,000 men idle, and deprived them of \$25,000,000 in wages. A similar controversy in Washington has been ended by an arbitration agreement which, it is expected, will prevent strikes and lockouts hereafter in the building industry there.—The 40,000 workmen in the clothing trade at New York have agreed with their employers to retain the present wage scale for another year.—In San Antonio, the State authorities are suing the officers of several unions to recover a penalty of \$6,000 for boycotting the owner and tenants of a large office building. Suit is brought under the Anti-Trust law of the State.—The Burlington Railroad Company has added from 12 to 15 per cent. to the pay of its train employees. This is the second increase made within a year.

**Treaties with
Cuba**

Two treaties or agreements were signed in Havana last week. The first, relating to the naval station at Guantanamo and the coaling station at Bahia Honda, provides that the United States shall pay an annual rent of \$2,000 and shall advance to Cuba the money required for the purchase of the land. The sums so advanced are to be applied to the payment of rent. In the second treaty, the United States renounces in favor of Cuba all claims to the Isle of Pines which it might make under the provisions of the Treaty of Paris, this being in return for the concessions granted in the naval station agreement. American citizens residing on the island or owning property there are to suffer no loss of the rights or privileges acquired prior to the ratification of this treaty. They will be subject to the laws which are applicable to other foreigners, with respect to their industries, trade and professional work.

**Pope Leo
III**

It became known on July 4th that Pope Leo was extremely ill, that, indeed, his life was in a most precarious condition. The

health of the Pope has been the subject of innumerable false reports during the past few years, but of the present danger there can be no doubt. It seems that he had driven in the Vatican gardens and had caught a cold despite the fact that the temperature was 96 degrees Fahrenheit. The cold settled in his chest and head and soon showed serious symptoms. Dr. Laponi, the Pope's regular physician, wished to have a consultation with the best physicians in Rome, but the Pope would not consent. He did, however, call in Dr. Mazzoni. In an interview Dr. Mazzoni said that the condition of the Pope was grave, in view of his great age, but that it was not yet desperate. He described the Pope's illness as being senile adynamic pneumonia, which is in lay language pneumonia attended with the weakness of old age. All day Sunday the Pope lay in a state of extreme pain, yet was fully conscious, and argued and discussed with his physicians over their prescriptions. Chloral and caffeine were administered to him by the mouth in order to strengthen his heart, and his only food was a little broth or oil beaten up with the yolk of eggs and sugar. He would take no wine, altho advised to do so by his physicians. Late in the afternoon his condition became so critical that the last sacrament was administered to him, with the participation of all the cardinals in the city and the whole pontifical court. The solemnity of the act was notable with the noble guards in their brilliant uniforms, the cardinal members of the sacred college and others gathered in order about the little couch of the pontiff. The Pope recited feebly the confession of faith, and finally the words of absolution and the formula of indulgence in *articulo mortis* were pronounced over him by the Grand Penitentiary. At the end all present fell on their knees, and the Pope, raising himself slightly, pronounced almost inaudibly his benediction. His condition as we go to press still hangs uncertain.

**Religion and Politics
in Rome**

Already Church politics are rife in Rome, and the question of the next Pope, in the case of Leo's death, is everywhere talked of. The first question to decide will be

whether the Conclave of Cardinals shall sit in Rome or somewhere outside of Italy. There can be no doubt, however, that those in favor of Rome will form a strong majority. It is also almost certain that an Italian will be chosen for the place, as under an Italian the temporal power of the Papal See is likely to be contested for far more energetically than under a foreigner. The chief candidates talked about are Cardinal Rampolla and Cardinal Vannutelli, who are both Conservatives, but are hostile to each other on the question of the relation of France to the Vatican. Among the Liberal candidates whose names are mentioned are Cardinal Bishop Agliardi and Cardinal Priest Satolli. It is also within possibility that a purely religious candidate will be chosen, who will attempt to keep politics out of the Vatican altogether. Or it may be the case that the two principal factions will prove too strong to admit any reconciliation and that one of the older Cardinals will be chosen under the expectation that he will not hold the seat for many years. Cardinal Oreglia, Dean of the Sacred College, is specially eligible in this sense, as he is seventy-five years old and not robust.—Premier Zanardelli has decided to continue in office as head of the Italian Cabinet and to hold the portfolio of the Interior, which was resigned by Signor Giolitti. Thus the old Cabinet, with minor changes, continues, and the crisis has been passed. Signor Zanardelli, who two years ago defined his policy as an attempt to introduce financial economy and purer politics, has at least done something to effect the latter purpose, and has brought the Italian Parliament into a better working state than it was before he took the premiership.

Kishineff The London *Times* pursues its inquest into the Kishineff massacre and quotes a correspondent of the Vienna *Zeit*, who has discovered that M. Plehve was directly responsible for the affair, that he had indeed planned for it long in advance. When his agents went further than he expected, he selected General von Raaben as a scapegoat. Of 700 persons arrested for participation in the outrages,

500 have already been liberated and 180 have been sentenced to penalties ranging from a fortnight to two months. Meanwhile our State Department at Washington has made it clear that the delay in transmitting the petition of the B'nai B'rith is due solely to the fact that the society has not yet got all the desired signatures to the document. Officials of the Department maintain that it has been scrupulously careful to act within the limits of official propriety, but that it certainly will not hesitate to give expression to the deep sympathy felt not only by the Administration, but by all the American people, for the unfortunate Jews of Kishineff. While Count Cassini was preparing to leave Washington for St. Petersburg, it was announced by the Russian Embassy that Russia would refuse positively to receive the petition. And in St. Petersburg the Foreign Office has issued this statement:

"The Czar alone can decide whether the petition will be received, but Alexander III would never have received such a petition. The petition from the Guildhall meeting, called by the Lord Mayor of London in 1891, was returned through the Foreign Office as being inconvenient. The Foreign Office hopes the Americans will not invite such a slight. They would resent an anti-lynching petition. The Foreign Office has no special interest in the question, except a desire that international relations remain unharmed, since the matter is purely domestic and belongs to another Ministerial department."

American papers have not been slow to point out the curious position in which this statement places the Czar, as if he were still under tutelage. The *Novoe Vremya*, too, in an article believed to be inspired, combats the claim of the United States that Russia should grant free access to Russian Jews who are American citizens. It declares that if such a claim were admitted the country would soon be flooded with Jews who have left Russia for various purposes. "While Russia," says the *Vremya*, "in no way assumes the right of criticising the internal measures of the United States, she, on the other hand, will not tolerate the least interference in her private affairs on the part of Americans." In Washington the opinion is expressed by many that

the petition of the B'nai B'rith will tend merely to inflame the Russians still more against the Jews.

Russia and Manchuria A statement was recently published in the *Sviet*, a newspaper of St. Petersburg, to the effect that the British and Japanese Ministers at Peking had presented a note to the Chinese Government in regard to Manchuria, and that Prince Ching, President of the Foreign Boards, had advised the Empress Dowager to accept the demands. The substance of these demands is as follows:

First—Russia's occupation of Manchuria threatens the maintenance of peace in the Far East and injures the interests of England and Japan.

Second—If the departure of the Russians from Manchuria is indefinitely postponed, England and Japan must proceed to protect their interests.

Third—China must demand from Russia the immediate evacuation of Manchuria.

Fourth—Great Britain and Japan acknowledge no treaty between Russia and China which does not bind Russia to evacuate Manchuria.

Fifth—If after the evacuation of Manchuria a treaty between China and Russia with respect to the civil administration of Manchuria is deemed necessary, such treaty can only be concluded with the approval of Great Britain and Japan.

Sixth—A reply to this note is demanded within five days.

In Washington nothing is known officially of these demands, and certainly this country is in no way party to them—supposing they have actually been made. While the American and to a large extent the European press is full of vituperations against Russia for her Manchurian policy, it is interesting to see the attitude taken by the papers of Russia in the matter. Thus the *Vestnik Europy* declares that the policy of Russia in China does not merit the reproaches which the American press is heaping upon her. Russia, it asserts, suffered more in China than any of the other Powers, and yet demanded less compensation. She was forced to occupy Manchuria, and once there could not leave until order had been restored and

the operation of her railroad had been insured. Russia ought rather to be convicted of heedlessness than of treachery. The most curious part of the statement made by the *Vestnik Europy* is an explanation of the vacillation, contradictions and uncertainties in Russia's conduct. These the paper asserts can be traced to causes quite clear to Russia, but which do not exist in foreign cabinets. In Manchuria three separate authorities are at work, and each has its own views and interests. The Minister of Foreign Affairs is concerned in avoiding all misunderstandings with foreign Powers, and is therefore always inclined to make peaceful declarations, even when their fulfilment does not depend on diplomatists alone. The Ministry of War for its part, on the other hand, is unable to withdraw from a region which needs military protection, and is often compelled to act in a manner contrary to the declarations of the diplomatist. The Ministry of Finance is chiefly interested in the East Chinese Railroad, and is compelled therefore to insist on great caution and the gradual evacuation of Manchuria.

Germany The final result of the German elections after the two second reballots is as follows:

Clericals	102	Poles	16
Socialists	81	Alsatians	9
Conservatives	52	Anti-Semites	9
Free Conservatives.	19	Agrarians and Peas-	
National Liberals...	51	ants' League.....	7
Richter Radicals...	21	Hanoverians	3
Barth Radicals....	9	Danes	1
So. German Radicals	6	Independents	11

Already the influence of the election is shown in Belgium by the more assured attitude of the Socialists of that country and by talk of establishing a republic there. A Republican mass meeting has been convened to meet in Brussels at the "Maison du Peuple," when resolutions of sympathy will be passed for their brothers beyond the Rhine. At the same time an anti-royalist movement is being fomented by the Socialists of Belgium.—At Kiel in the race for men-of-warships the Americans won two firsts, a second and a third in their contest with the boats manned by Germans. The Emperor presented the winners with prizes and praised their rowing. On the last day

of June the American squadron sailed away from Kiel to the sound of German salutes. A good many of the German journals are attempting to find political significance in this courteous meeting of the fleets, but to Americans the affair has seemed of no importance. An impressive reception is planned for the American squadron on its arrival at Portsmouth Harbor, where it will be welcomed by the British Channel fleet under Admirals Beresford, Hedworth and Lambton.

Bulgaria and Servia

Bulgaria has sent a circular to its representatives in other countries, and to the foreign Ministers in Sofia, in which she declares that Turkey has failed to assist in carrying out the reform scheme to which the Porte acceded, and is concentrating troops and artillery on the frontier of Bulgaria. The note asserts also that the Turkish soldiers under the pretext of searching for arms are perpetrating all sorts of outrages on the Bulgarian people in the hope of provoking a conflict. On the receipt of this note in Vienna Count Goluchowsky, the Austrian Chancellor, declared that the Powers would never permit Turkey to attack Bulgaria. Turkey in reply has sent a note to Count Goluchowsky through her Ambassador at Vienna, explaining the reason for the disposition of troops near the Bulgarian frontier. On the other hand a newspaper in Sofia quotes the Bulgarian Ministry of War to this effect:

"We will never attack Turkey, nor will Turkey attack us. On the contrary, we will fight for her against a common enemy. War would endanger us both and leave us at the mercy of the German colonists and other vultures who are waiting for our end to take our place. Should a palace rebellion remove the Sultan, we would march on Constantinople, set his son on the throne, and baffle the intrigues of Ras-had Bey, the Sultan's brother."

King Edward of England has replied courteously to the note sent by King Peter of Servia, in regard to the succession of the latter to the throne. It is stated officially in London, however, that this note of King Edward does not at all change the attitude of England toward the new Servian Government.

A Japanese Ethical Society

It is not to be supposed that the three native religions of Japan with Christianity as a fourth can live together in this age without raising all kinds of questions. The country has become conscious of itself after a period of acquiescence in everything brought to it from the West. Now prominent thinkers are asking: What is the future of religion in Japan? Shall Buddhism or Confucianism or Shintoism or Christianity become the prevailing faith? Recently Dr. Tetsujiro Inoue, who is at the head of the schools of Philosophy in the Imperial University, wrote a paper in which he maintained that the religion of the future must be based merely on ethical principles, and that humanity is the only consideration of the religion of the future. On the other hand, Dr. Seisen Murakami, who is a Buddhist scholar of high reputation, has written articles insisting that a religion to be such must contain in itself an element of sentiment, that it must contain something to be worshiped. Meanwhile it has seemed to thoughtful Japanese that the Government of the country was becoming daily more corrupt, that ministers were leaving their places to enter into commercial pursuits, and that the power of money was increasing enormously. These questionings and these anxieties are the cause of a new party, named Risodan or Ideal Society, which was organized by the editorial writers of the *Yorozu Choho*, who were assisted by prominent men of all kinds and professions. This organization secured immediately hundreds of thousands of members throughout the country and local branches were established everywhere. The aim of the society is to elevate the moral tone of the members in general, and to apply the principles of morality to every day life regardless of religious beliefs. It is ethical and practical. The central authority is located in Tokyo, and from there lecturers are sent out to any branch that requires them. The society has considerable influence over the younger generation, and it is probably taking the place of much of the religious influence that for a while came from the outside.

Bribers and Bribed

By John P. Peters, D.D.

RECTOR OF ST. MICHAEL'S CHURCH, NEW YORK CITY

IN THE INDEPENDENT of June 11th appeared an editorial entitled "Bribers and Bribed," in which it was pointed out that the root of the evil of legislative corruption is not in the bribed politicians but in the men who bribe the politicians, and that the real corruptionists are those men, often, if not generally, reputable members of society, who, in their business relations, and especially as officers or directors of corporations desiring charters, contracts or privileges from the commonwealth, bribe legislators by payments, direct or indirect, in money, stock, bonds, "inside information," party contributions, influence, positions for themselves and their friends, and the like, to grant to them valuable property, privileges or business for no adequate return.

In this editorial were quoted with commendation a few sentences from a speech of Mr. Choate at the Parkhurst dinner in 1894, in which, discussing the problem of municipal reform, he—after pointing out that the root of the evil of municipal corruption is the respectable citizen, socially well connected, possibly a pillar of the Church or distinguished for benevolence and public service, who, in his corporate capacity, as the director of a gas, steam or street railroad company or some similar corporation dealing with public franchises, secures special legislation and peculiar privileges by corrupting the servants of the public—argued that we should never secure a clean administration of the city (for it was with municipal affairs that his speech dealt) until we brought home their guilt to these reputable gentlemen by branding them as what they are—thieves—expelling them from our clubs, driving them out of society, and casting them out of our church boards and vestries.

I believe that your argument and his are thoroughly sound; that here are the roots of the evil, and that the cure lies in digging up and exposing these roots to the purifying sunshine and air of the

sight and discussion of the public. Bad as is corruption in the police department—partnership of the police with proprietors of bad houses, gambling hells and the like—worse and more dangerous is the corruption which proceeds from this exploitation of the public by the "respectable" element of society. Every one is prepared to denounce public corruption, with its blackmail of prostitution, gambling and the like, and frankly to call those who are concerned in it scoundrels and criminals. The press can always be counted on to condemn this form of corruption, and to hold up to the reprobation of society not merely the crime but also the criminals. Even preachers do not hesitate to name from the pulpits men who are connected with such flagrant evil-doing. Not long since our honorable Mayor—the public, as represented by the press, apparently cordially approving—refused to confer with the representatives of the Liquor Dealers' Association, including, by the way, representatives of grocers and druggists having licenses to sell liquor, until or unless they would purge themselves from the charge of having a large corruption fund to secure legislation favorable to themselves or to defeat attempts to amend the liquor law in a manner hostile to their interests.

Now about the same time the Mayor and all the papers denounced the iniquitous attempts made to carry through the Legislature at Albany bills of a most nefarious character, conveying public property and valuable public privileges to certain great corporations, notoriously street railroad corporations, for nothing—bills so iniquitous that their promoters felt it necessary to conceal their object by methods of legislative and legal trickery. Would our Mayor refuse to receive or to confer with the wealthy and eminently "respectable" directors of the companies concerned in these immoral and corrupt proceedings until they should purge themselves of the charge implicitly

made by him and directly by many others, including the best part of the press, that they were systematically engaged in debauching the Legislature in order to exploit the public? And would the public and the press support him in such an attitude? Would our reformers refuse to accept the tainted contributions of these men (or even corporations), or to associate with them in clubs organized for purposes of political reform? We place legislative, judicial and executive corruption by these corporations, who are the great corrupters, on a different footing from the relatively petty corruption of liquor dealers and the like, and treat the men who stand behind this corruption with a courtesy and consideration which we do not extend to the despised liquor dealer and his brethren. And it is precisely because of this attitude of our high-toned public men, of our reformers, of our religious and social leaders and of the press that the evil doing of these men is vastly more dangerous to the public welfare than the evil doing of the liquor dealer or the keeper of the gambling house or brothel. It is necessary, if we would eradicate corruption, as you argue, and as Mr. Choate has argued, that these "respectable" directors of corporations should be held up to the public opprobrium and scorn as thieves, receivers of stolen goods and, above all, as traitors to their country, who are ready to bribe and debauch the Government for the sake of private gain.

But how is this to be achieved? The press of New York rang last winter with denunciations of the L'Hommedieu bill and other similar sneak thief bills which were introduced in the Legislature of the State of New York. How much effect did all that was said have upon the men who were to profit by those bills, and who in all common sense must be held responsible for them? Who knew even who those men were?

There are usually in such corporations some unscrupulous men who do not care for public sentiment and who can never be reached by anything short of a successful criminal prosecution. But there are, also, men of good reputation in the business and social world. Sometimes these latter do not really know what is

going on, paying no attention to details and practically knowing nothing about the business they are supposed to direct. More often, I fancy, they wink at the legislative or other corruption engineered by the counsel or other agent of their corporation, on the ground that this is "business, not religion," and that such corruption is a necessity of the situation. Sometimes such men, honest and high-toned in other respects, do themselves actively promote such corruption, excusing it always on the ground of business necessity. But whatever their attitude, these men are all susceptible to the opinion of the public, or of their own social and religious circle; and almost without exception they do not openly engage in corrupt practices, not only because they do not wish to expose themselves to legal penalties, but also because, however they may excuse their concern in these practices to themselves, they realize that they are corrupt, and would be so judged by the public if made known to it. Now so long as the corporations indulging in these corrupt practices are denounced merely in a general way, as such and such a corporation, these men do not feel the indignation of the public. Their share in the iniquity is not brought home to them, and few or none of those with whom they associate and whose good opinion they desire know or appreciate their part or responsibility in the shameful transaction; indeed, in many cases they do not themselves appreciate it. Corporations are without souls—largely because they are known to the public entirely in an impersonal manner. You can touch the soul of a corporation the instant you touch the individuals who direct that corporation and hold each director individually and personally responsible.

Some time since, at the time of the horrible tunnel disaster, THE INDEPENDENT set a good example by naming not merely the railroad corporation which was responsible for that massacre but the directors of that corporation, on whom must fall the moral (apparently not the legal) responsibility. This, it seems to me, is the course which should be pursued, and in which the press must lead the way. Responsibility for the acts of the corporation must be forced

home upon the directors individually and personally. Now the public, society and the churches do not know, and in many if not most cases have no facilities for ascertaining, who are the real offenders in this widespread corporate bribery. Which are the corporations that bribe, and who are the officers and directors of those corporations? The press has facilities for ascertaining and facilities for making public the facts. I do not think the press has altogether done its duty as a leader and representative of public opinion and public needs in handling this matter of corporate corruption and fixing the responsibility for it where it belongs.

Last winter, when it was discovered that the sneak thief bills, of which I have already spoken, had been introduced in the Legislature at Albany, designed to pick the pockets of the public, and it was pointed out that the parties especially benefiting by these bills would be the Interurban and Metropolitan Street Railways, as chairman of a committee of citizens which had been organized to bring about improvement in our street railway service and authorized by the Executive Committee of that body, I sent to the papers of the city a letter denouncing those bills, and mentioning the names of the directors of the Interurban and the Metropolitan railways (perhaps the Metropolitan Securities Company should have been added) as those who should be held responsible for those bills by the public. The papers printed more or less of this letter; some of them denounced the above named corporations as the promoters of these and other similar bills, but there were, I believe, only two papers in the City of New York which were willing to print the names of the directors (the *Tribune* and the *Evening Post*, if my memory serves

me aright), the essence of that letter. Now there is a sensational journalism which delights in personalities, telling of the private doings of individuals, with their pictures (or failing that, the picture of some one else) attached, often in a slanderous and offensive way. There is another form of journalism which, through subservience, political, social or financial, to certain powerful interests, will not deal boldly and effectively in such matters affecting interests and persons influential politically, financially and socially, and while virtuously denouncing corruption makes that denunciation practically worthless by failing to denounce the persons who promote or are responsible for that corruption. I think that the latter form of journalism is the more vicious and the more dangerous of the two.

What you proposed in your editorial and what Mr. Choate proposed in his famous speech is, doubtless, the course which should be pursued by both church and society. But I do not see how it is possible for church and society to do what you there propose unless the press, on which these depend for information, will honestly and fearlessly give us the facts and publish the names of the true offenders. When a corporation is accused of corrupting the Legislature, or other evil practices, why should not the papers publish the names of the directors of that corporation, precisely as some papers publish the names of legislators voting for a bad bill? Would not such publicity persistently practiced do something toward cultivating a greater sense of responsibility on the part of the directors of corporations and awakening their own and the public conscience by exposing them personally to the judgment of the public?

FROM the silent spring,
Cooling waters murmur laughter.
From the silent soul,
Thoughts or speak or sing,
Drawing sweetness after.

REMINGTON, IND.

The Misgovernment of the Congo Free State

By W. M. Morrison, D.D.

[Dr. Morrison has just returned to this country from his mission station in the Congo Free State, and his subjoined observations and experiences will be interesting, we feel sure, to all our readers.—EDITOR.]

MY claim for venturing to write on this subject is based on the fact that I have been a missionary of the Presbyterian Church in the Congo Free State for the past six and a half years. I have been stationed at Luebo, a large native settlement and trading center at the head of navigation on the Lulua River, which is a tributary of the Kasai, and this latter is in turn the largest Southern tributary of the great Congo River. Since Luebo is thus in the interior about twelve hundred miles, almost due east from the mouth of the Congo River, I have thus enjoyed exceptional advantages in observing the operations of the State Government in the various parts of its vast domain,

which is nearly half that of the United States, and comprises a native population variously estimated at from fifteen to forty millions.

As a matter of history it will be remembered that the Congo Free State came into existence as an independent Government as a result of the Berlin Conference, which convened at the capital of Germany in 1884. Leopold II, King of the Belgians, had for several years prior to the meeting of that Conference been much interested in the exploration of Central Africa. As early as 1876 he had called a conference in Brussels composed of representatives from several different nations to consult regarding the sending of a large expedition into Africa, which was

to establish posts at various points for the professed purpose of assisting missionaries, travelers, traders and others in their efforts to bring European civilization in touch with the Dark Continent. The King, being one of the shrewdest diplomats in Europe, knew that Belgium, being a Neutral Power, could not well enter upon a declared colonial policy beyond the seas without impairing her neutrality, so it was necessary to cover up his real intentions under the cloak of philanthropy, and it is remarkable to observe how long and how successfully this cloak, so persistently displayed, has managed to conceal the real truth of his intentions from the eyes of the world. Money was raised, Henry M. Stanley was secured and put at the head of the so-called "International Association for the Exploration and Civilization of Central Africa;" a prominent American citizen and Minister to Belgium, Hon.

A Victim of a Rubber Raid. The boy shown in the illustration is now cared for by a British missionary in the Upper Congo

Henry S. Sanford, was enlisted in the enterprise for reasons which we shall see later. The association, under Stanley's masterly, if not humane, leadership, succeeded in establishing a number of posts, extending from Vivi on the West Coast to Stanley Falls, far in the interior. The secrecy and the domineering energy of the leader of the enterprise in Africa soon aroused the suspicion of the Powers having interests or wishing to acquire interests in that part of Africa, and trouble between the Powers was brewing. The King at this juncture made his *coup* and used the Hon. Henry S. Sanford to arouse American interest in the enterprise, with the result that on the 22d of April, 1884, the United States Government, from its sympathy with the humane and benevolent professions of the International Association of the Congo, "recognized the flag of the International African Association as the flag of a friendly Government." The result was that when the Berlin Conference met in the fall of the same year, for the honest purpose of arranging in an amicable way the African land grabbing muddle, the Conference was met at the outset by the International Association, which wanted recognition as an independent and sovereign Power with a domain to include nearly all of the Congo River Basin. Seeing that jealousies were likely to arise, the association was recognized and thus was created a great "buffer" State between the territories of France, of England, of Germany and of Portugal. Leopold II, being the ruling genius of the old association, was made absolute and sole sovereign of the new State, with no parliament or congress to limit, if necessary, his power to do wrong. It is indeed an anachronism, as the London *Spectator* recently said, that the closing years of our enlightened nineteenth century should have witnessed the deliberate establishment in Africa of a despotism more cruel than that of Turkey and more relentless and overbearing toward native and foreigner than that of the Czar of Russia. These are not idle words; I make them calmly and deliberately in the light of history and the facts, and I sincerely believe them to be true.

The Berlin Conference, however, sought to reduce the dangers of the despotism by drawing up certain stipulations embodied in a Treaty, and this Treaty was intended as the Constitution of the new State. It was most clearly and forcibly stipulated that there should be freedom of commerce and trade for all nations, that missions and philanthropic enterprises of every kind should be permitted to carry on their work without "any restriction or impediment whatsoever," and, most important of all, the trading in slaves with all its attendant horrors was to be suppressed. With the rights of natives and traders and missionaries thus carefully guarded by an international treaty, it remains to be seen how faithfully King Leopold has performed the trust committed to him.

We shall speak first of the question of freedom of trade and commerce. Scarcely had the new Government come into existence before the King passed decrees giving over to the State all the lands of the natives, except perhaps the very small part actually under cultivation. The natives at one stroke of the pen were thus deprived of the right to their own tribal territories. It is true that Henry M. Stanley had patched up several scores of bogus treaties with independent chiefs, by which, as he claims, they agreed to give over their lands and their persons into the control of the old Association of the Congo, but those of us who know, often from bitter experience, the adeptness of the native African at driving a trade and his cleverness in diplomacy can only laugh at Stanley for trying to be serious about his native treaties. I have no doubt, however, that this very deception laid the foundation for the wholesale robbery of the native lands which was one of the first acts of the newly formed State. The next step in the land grabbing enterprise was for the King by decree to set apart great areas of the territory for his own personal exploitation. This is known as the *domaine privé*. From these regions all traders and missionaries were excluded. The next step was the partitioning out of large sections of the State to Belgian monopolist companies having exclusive rights of trade, with the State owning a

controlling share of the stock of the companies. Up to about a year ago the section in the vicinity of my station had been left open to free trade, there being five independent companies at Luebo, but the beginning of last year saw all these companies forced into a big monopoly with the State Government as chief stockholder. Now there is only one trading post at Luebo and this is the new monopolist company. An English trader came to Luebo just about the time the new company was organizing and tried to secure only a few square yards of land on which to engage in legitimate trade. He waited many months in vain and at last had to go away. All of this means that now perhaps four-fifths of the entire export and import trade of the country has been forced into the hands of the Belgians, and the Congo State has become the largest ivory and rubber dealer in the world.

But not only has the King closed up the country to the freedom of commerce which was guaranteed under the Treaty, but he has at the same time closed it up to the progress of missions—at least to Protestant missions. During the first ten or twelve years of the State's history we were able to buy land grants, but within the past four years we have been unable to buy land, the State utterly refusing to sell it under any conditions. Our own Mission has within that time asked for several land grants, all to be refused; other missions are in the same fix. The latest case is that of the Baptist Missionary Society of England, which is desirous of opening up a line of new stations from the region of Stanley Falls east toward Uganda. The policy of this society heretofore has been to defend the State in its system of treaty breaking, evidently hoping thereby to secure favors. The great Baptist Union has, however, recently condemned this policy, and it remains to be seen now what the society will do next.

Some of the missions have taken short term leases simply in order to be able to go on with the enlargement of their work, but the giving of leases evidently means trickery and the chances are that the labor and expense of years will be lost. When I was in Brussels only a few weeks ago to consult with the State au-

thorities there regarding the matter of land grants for the enlargement of our work I was told that if I accepted a lease they would promise not to interfere with the work at the expiration of the lease. When I asked the State official to put this promise in writing for me, he refused. I read in a New York paper a few days ago the account of an interview with the King in which he is reported as saying that the "open door" prevails in the Congo State. If he really said such a thing it only shows the utter disregard he has for the truth, and it means that he is willing to descend to any depth in order to keep the world blinded as to the fact that he has been in these eighteen years metamorphosed from a philanthropist into a money-monger and taskmaster.

We shall now consider the question of slavery, which the Treaty of Berlin clearly stipulated that the new State should use every legitimate effort to suppress. Between the years 1885 and 1889 the King noticed the gradual encroachment of the Arabs in the eastern part of his domain, and during these years he also discovered the value of the ivory and especially of the rubber, which was found almost everywhere in the forests. Putting these two ideas together in his mind, with the former, however, only publicly expressed, he called a Conference of the Powers in Brussels in 1889 and secured from them the right to organize and equip a native army for the ostensible purpose of suppressing the Arab slave trade. He also at the same time got permission to levy duties for the support of this army and the necessary governmental machinery. I say here in all candor that the collecting of this army of natives, now numbering 18,000, cannibals for the most part; the arming of them with repeating rifles; the posting of them throughout the confines of the State; the tyranny and bloodshed and reign of terror which it has produced throughout the confines of the State, mark without doubt one of the darkest and most shameful pages in modern history—and all done under the cloak of philanthropy. True, the Arab slave raiding has been suppressed for the most part, but the Arabs were angels of mercy as compared to the armed cannibals of King Leopold

and his numerous "friendlies," who go about plundering and burning villages, seizing slaves, cutting off hands and committing the most diabolical crimes when the tribute demanded by the King is not forthcoming. The natives now have no rights left which the King deigns to respect. Forced labor and military laws have been in operation for some years. I have seen soldiers at Luebo who were caught in the Bangala district, far away up the Congo River; on the other hand, I have seen soldiers in service at Boma, on the West Coast, who were brought down from the region near Luebo; I saw last August a white officer with soldiers come to Luebo and seize in the forests, whence they had fled for refuge, about a dozen and a half of men, and they were taken away under guard with ropes around their necks in true Arab slave raiding style; only last March I came down on the Congo Railway from Stanley Pool to Matadi on the same train with three trucks loaded with slaves who had been caught at or near Lusambo, which is the seat of the chief white officer in our district. I gave them some food and they begged me to tell them where the State was taking them. I have seen at least 50,000 people hiding for weeks in the forests without food or shelter, seeking refuge from the white Belgian officers and their native soldiers. When it is announced at Luebo that soldiers or a State officer are coming many helpless women and children customarily flee to our Mission premises for refuge. I have deeply felt for the poor people in their anxiety and distress and I have wondered how much longer the enlightened civilized Powers of the world would permit this blasting curse to remain upon Africa as an open sore on the good name of philanthropy and civilization.

Not only does the State use its regular soldiery in the terrorizing of the natives and in the perpetrating of all sorts of barbarities, but the State systematically—at least in my district—makes friends with some strong chiefs or tribes, and these become, if possible, a greater terror than the regular soldiers. An illustration of this may be found in the Zappo Zapps, a strong, warlike cannibalistic people who were brought to Luluaburg, a State post near Luebo, about twelve

years ago. Ever since then they have been the recognized slave raiders and slave dealers of our region, showing conclusively that the State not only permits but tacitly instructs them to make raids from time to time. As a result of this slave raiding, going on more or less all the time in some part of the district, I can buy slaves at Luebo almost any day at from \$10 to \$15 apiece. About three years ago a company of these Zappo Zapps, under instructions, as I believe, from the white State officer at Luluaburg, made a raid near to one of our Mission stations. This raid was in progress for some weeks and the whole region was thrown into a state of terror. One of our missionaries, Rev. W. H. Sheppard, F.R.G.S., went to the stockade where the Zappo Zapps had intrenched themselves. He was received kindly by the chief of the expedition; he saw and counted eighty-one human hands slowly drying over a fire, and the chief said they were to be taken back to the white State officer; he saw about forty-five dead bodies piled up in a heap outside the stockade. Upon asking why the flesh was carved off from some of the bodies he was told by the chief that his people had eaten the flesh.

And so I might go on almost indefinitely enumerating case after case of outrages done toward the natives, but why consume space by telling more of these harrowing scenes which are daily occurring in the Congo State? I am asked if these things have been brought to the attention of the State authorities, since the King and his agents are constantly assuring the world that justice will be done and punishment will be meted out to offending soldiers and officers if only the facts are known. Time and time again I have reported these injustices to the Government, but they always resent my interference in these matters. "Investigations" are conducted *in secret*, and everything is done to free the officers from blame. In fact, they are really not to blame very often, for they must put into execution the forced military and labor laws which the King has decreed. What is a subordinate officer to do when he has received instructions from a superior to furnish by a set time a certain number of soldiers, a certain number of

workmen for the posts and plantations and a certain amount of rubber and ivory? He always has a squad of soldiers placed at his disposition, and the demands of his superior are therefore generally met, even if it is at the cost of bloodshed and the devastation of villages and plantations.

About seven years ago the King put another blind before the eyes of the world by the appointment of a Native Protection Commission, composed of Protestant and Catholic missionaries, which was to see to it that the natives were protected in their rights. The Protestant members of this Commission—I do not know about the Catholics—had been previously to their appointment decorated by the King with the medal of the Legion of Honor. So far as I know this Commission, as was expected at the time, has done nothing. I have at least twice reported outrages to them. With reference to the slave raiding in our section last summer they simply reply that the State has forced labor and military laws and that nothing can be done. One of these Commissioners, who lives at Matadi, saw the three trucks of slaves to which I referred a while ago, but that was the end of it. He talked very bravely to me in private about the State injustices, but he never says anything in public.

Everything is done by King Leopold to prevent the world from knowing the facts of the case. He has his agents in almost every country, men who have been or are now in the employ of the State, and they are expected to deny *in toto*, without any knowledge of the facts, the statements made by eye-witnesses. Even some missionaries are lending themselves as tools of the King, chiefly, I think, because they fear his absolute power. Even Henry M. Stanley, who has not been on the Congo for perhaps ten years, is always ready boldly to deny facts of which he knows nothing. Short

extracts are culled from letters written years ago by missionaries and others and the authors are made to say things which they now repudiate or never meant to say. I saw only the other day a letter from a former missionary publicly condemning the State for using statements of his which he had made years ago when the same conditions did not prevail. Some years ago I read in THE INDEPENDENT an article by Henry M. Stanley, and among other things, varying more or less from the truth, he said that the State had established large schools where it placed "abandoned children" for education. It may be interesting to know that these "abandoned children" are the small boys and girls who are caught in the numerous raids and are turned over for the most part to the Catholic Missions, where the boys are to be trained as soldiers. Only a few weeks ago I saw a large company of these boys at Boma marching in line with the soldiers.

I state here that I am more than willing for an impartial court to examine fully all the charges I have made, and the same kind of charges are now being made by many others. But I am not willing for the matter to be submitted to the Congo State courts, for, as the London *Post* recently said, the Congo State "cannot be permitted to judge in its own case." America is greatly responsible for the existence of the Congo State. An important committee will in a few days meet in Washington to lay the whole matter before the authorities there, and it is to be sincerely hoped that America and all the other civilized Powers will quickly join hands in suppressing this curse which they have placed upon Africa. The facts are beyond dispute, the responsibility is undeniable, and the enlightened and outraged public opinion of Europe and America, I believe, will demand in the name of humanity and Christianity that this open sore be healed.

LEXINGTON, VA.

Socialism in Europe

By Emile Vandervelde

MEMBER OF THE BELGIAN CHAMBER OF DEPUTIES

[M. Vandervelde is universally regarded as one of the most scholarly and brilliant of the Socialist leaders of Europe. He is a tireless worker and has a marked genius for executive management, as his leadership in the Belgian labor movement amply attests. He was born in 1868 of middle class parents, studied at the Free University of Brussels, qualified as *docteur spécial* in science and became a professor in one of Brussels's secondary schools. He has written any number of pamphlets and articles for periodicals, and at least one book, "Collectivism: or, Industrial Evolution," a translation of which has had a considerable sale in this country.—EDITOR.]

SINCE the meetings of the International Socialist Congress in Paris in September, 1900, the International Association of Workingmen has been entirely reorganized. All the Socialist parties of the two hemispheres, including those from the European countries, the United States, Japan, Australia and Argentina, are now represented in the International Bureau, in the Maison du Peuple, Brussels.

In the old International the Central Committee, like a military staff, managed the movement. In the new the federal agreement permits the strongly constituted national parties to retain their autonomy, and to adapt their methods to the differing political and economic situations. But the distance of many of the countries from one another and from the international headquarters makes impossible the maintenance of quick and frequent communications between them. Accounts of Socialist happenings are often incomplete, and a great part of the public is thus left in ignorance of important occurrences. It is therefore a pleasur-

able task which I undertake in attempting to furnish a concise, and as far as possible precise, report of the present state of Socialism on this side of the water for the benefit of American readers.

We need not consider Russia, because the tyranny of the Government, the supineness of the population and the slow numerical growth of an industrial class compel the revolutionists of that land to fight for the most elementary liberties—liberties which are the necessary preliminaries for a normal growth of Socialism. But in Occidental Europe—in the countries which possess

at least a minimum of constitutional liberty and of parliamentary representation—we can plainly distinguish, from the Socialist point of view, three principal groups:

First, England, where the labor movement has developed under conditions far different from those prevailing on the Continent.

Second, the Latin countries—France, Italy, Spain, the Romance cantons of Switzerland, and, to a certain degree, the French provinces of Belgium.

Third, Germany and all the nation-

EMILE VANDERVELDE

alities which are closely related to it. The Socialist parties of Holland, Denmark, Norway, Sweden, Austria, the German cantons of Switzerland and the Flemish provinces of Belgium form, within their political borders, to a certain extent, self-governing sections of the German Social Democratic party.

Generally speaking, it can be said that, owing to the growing approximation of economic conditions in the various countries of Occidental Europe and to the close relationship of the several working class movements, the marked differences among the latter constantly tend to decline and disappear. The German Social Democratic party, for instance, a few years ago adopted certain ideas from the English trade unions. The latter, on the other hand, are moving rapidly toward political action, and, like the German workmen, the movement is anti-bourgeois.

It is strange that in a country like England, where two-thirds of the population are concentrated in the cities, where the industrial proletariat exceeds that of any other country, where the trade unions count nearly two millions of members (1,922,780 on January 1st, 1901), Socialism as a political movement should be so negligible a quantity. Such an anomaly must have profound causes. The low standard of primary instruction during the greater part of the nineteenth century, the ingrained aversion of the Anglo-Saxon to general ideas and formulas, the cringing subserviency of the lower classes to wealth and rank, and the prudence and conciliatory attitude of the bourgeois parties have all been influential; and so, too, has been the practical monopoly in industry which British capitalists so long enjoyed, and which enabled them to grant at least a partial satisfaction to the demands of labor.

But independent of these general causes, there are a number of more pertinent factors which, tho superficial in appearance, are yet important, and by which the development of a third party is hindered. In the first place, the two established parties, Conservative and Liberal, constitute between them a powerful machine which menaces and

usually crushes out a newer organization. In the second place—and this is a very important factor—the English electoral system does not allow for a test vote. There is no provision for a second ballot, and the candidate who receives a mere plurality of the votes is elected. Under these conditions the nomination of a working class candidate against a Conservative and a Liberal or Radical in a “three-cornered” contest often results in the election of the Conservative, even tho he represents only a minority of the electorate. In other cases, to avoid such an outcome, the workers continue to vote for Liberal or Radical candidates, in spite of their preference for candidates more nearly representing their interests.

There is also to be added the fact that election expenses in England are not borne by the State. Each candidate must pay his share of the cost of conducting the election in his district. It is a considerable sum in all cases, and there is no reimbursement. If elected, there is still further expense, since members of Parliament receive no salary, and the member, if he have no other source of income, must be supported by the associations which he represents. Under such conditions it is easy to understand why the representation of the working classes in the House of Commons is small. Excluding John Burns, the famous member for Battersea, who stands alone, and a few workmen who have been elected by the Liberals and who act with them, the Labor party counts but four members: J. Keir Hardie, R. Bell, D. J. Shackleton and Will Crooks, recently elected at Woolwich.

But it is not to be doubted that the next general election will show marked changes. The “hair disease” following the war, the financial burden occasioned by the military expenditures, the discontent aroused by the Education bill and the recent decision of the Law Lords, which threatens the very existence of the trade unions, appear to have impressed English workmen with the necessity of independent political action.

The Socialist groups—the Fabian Society, the Social Democratic Federa-

tion and the Independent Labor party—represent but little power. But the Labor Representation Committee, constituted in 1900 for the purpose of securing united action by the Independent Labor party, the Fabian Society and the principal trade unions, represents a membership of 850,000 men. Furthermore, the principal trade unions have decided to present candidates at the next general election, and in a recent article in the *Nineteenth Century* Mr. Keir Hardie announces the creation of a fund of \$250,000 for that purpose. Fifty new candidates are at present designated, and the leaders of the new movement expect that at least twenty-five representatives of labor will be elected. That these expectations are not chimerical is evidenced by the success of Mr. Shackleton in the bye-election in Lancashire, and by the glorious triumph in the recent bye-election in Woolwich of Will Crooks. In this contest the Conservative majority of 2,800 votes, given in 1895, has been changed to a Labor majority of 3,300 votes. It is not to be doubted that this election marks a turning point in the political history of England, and that the trade unions, most of which show a strong and rapid drift toward Socialism, will soon gain an important influence in the House of Commons.

Passing now to Latin Europe, we see an entirely different picture. In Spain—tho chiefly in Catalonia, the only part of this unhappy country which may be said to be truly alive—the Socialists are beginning to emancipate themselves from Anarchistic theories and reveal a tendency to support the Republicans. In Italy, where the same evolution was long ago accomplished, the Socialists are making considerable progress, even in the country districts, and their representatives are among the essential pieces to be found on the Parliamentary chessboard.

But it is chiefly in France where the Socialist movement attracts attention, at the same time showing a marked contrast with the English labor movement. In England the workmen are admirably organized from the economic standpoint, and but feebly organized from the standpoint of Parliament-

ary representation. In France, on the contrary, where agriculture still occupies half of the population, where the petty bourgeois elements are very numerous, where the industrial centers are relatively rare and isolated, the economic organization of the working classes is rudimentary enough, while as to Parliamentary power the Socialists exercise a degree of influence unknown in any other country.

The two groups of Socialists in the Chamber of Deputies—revolutionists and reformers—are divided among themselves and number scarcely fifty members all told. But in the radical and anti-clerical majority that supports the Combes ministry the Socialists play a leading part. Among these are M. Jaurès, vice-president of the Chamber, and M. Millerand, the ex-Minister of Commerce and a minister-to-be in some future cabinet. Active, energetic and brilliant are the roles which they play.

It is true that the necessity of united action by the majority against the reactionary opposition requires sometimes very blameworthy concessions on the part of the Socialist members. Jaurès, the leader of the Socialists, is at the same time the leader of the Radicals of the majority. Under such circumstances it is but natural that the anti-clerical demands insisted upon by both Radicals and Socialists should take precedence over the economic demands insisted upon by Socialists alone. Thus the religious associations are suppressed and the exclusive control of education by the state is made an issue, while the special needs of the proletariat are to a large extent neglected. It is, therefore, no wonder that the revolutionary Socialist elements grouped about MM. Vaillant and Guesde fiercely attack the opportunism of the Socialist reformers as a policy which threatens a real danger to the future of Socialism in France.

Meanwhile, however, it is but just to recognize that the participation of the Socialists in government has the advantage of dividing the bourgeois parties by showing them the natural antagonism between the Republican State and the Catholic Church. There

is no doubt, furthermore, that the Radico-Socialist union aids materially in diffusing Socialist ideas throughout public institutions and the universities. It is a remarkable phenomenon that the intellectual conquests of Socialism have proceeded so rapidly among artists, scholars and professors since the Dreyfus affair. The breakdown of the intellectual barriers between France and Germany served as a means of acquainting thousands with their first knowledge of Marx, Lassalle, Engels, Kautsky and other German Socialist writers, and it promises for the future a steady development of Socialism.

The space at my disposal is too limited to permit me to speak at length of the smaller countries—those experimental fields of social policy. In Holland, where the Anarchistic elements are dying out, the Socialist party finds partial compensation for its numerical weakness in its notable intellectuality. In Denmark the labor unions and co-operative societies form the solid foundation of a Socialist organization, very powerful in the principal cities; in Copenhagen, for instance, one of the four Burgomasters is a Social Democrat. In Belgium, which takes the lead of all countries in Socialist co-operation, the Workmen's party is the leading party in opposition to the Government. In Austria the Social Democrats, under the able headship of Victor Adler, tho numerically weak, have at least the advantage of avoiding the inter-racial war which constantly divides the people of that unhappy country.

Passing to the Social Democracy of Germany, that state within a state—that formidable power which shakes up Popes and Emperors, I must express regret that I cannot devote a whole volume to its consideration. However, one of our friends, Edgard Milhaud, a professor in the University of Geneva, has recently done this, his admirable work giving a thorough and comprehensive account of Socialist activity in Germany.*

The wonderful progress of the Social Democracy during the last twenty-five years is evident from the following fig-

ures: The number of votes polled for Socialist candidates for the Reichstag, was, in 1877, 493,288; in 1878, 437,158; in 1881, 311,961; in 1884, 549,990; in 1887, 763,128; in 1890, 1,427,298; in 1893, 1,786,738, and in the latest election, 2,107,076.* Fifty-eight Socialist representatives sit in the Reichstag, and the number would exceed one hundred, making them the foremost group in that body, were it not for the gross unfairness of the Parliamentary apportionment by which the interests of the large cities are systematically sacrificed to those of the country districts. With a view to further successes, the party executives are putting forth herculean efforts in the present contest, which closes June 16th.

For a long time political agitation absorbed the greater part of the activity of the Social Democrats. They did not believe in a future for the labor unions, and they distrusted the co-operative societies. But during the last ten years, owing to the influence of the various English movements, and to a certain extent, of the Workmen's party of Belgium, this attitude has suffered a considerable change.

In 1890 the *Gewerkschaften* (labor unions based upon the class struggle) numbered but 287,659 members. In 1901 this number had increased to 686,870. The revenue of these societies had grown to nearly \$1,900,000, and a general committee, centralizing the activities of the various bodies, had been formed which has come to be a strong and effective power. Then, too, the great success of the co-operative societies in Saxony, particularly in Leipsic and Dresden, the steady drift of the co-operators toward Socialism, even the attacks upon co-operation emanating from the bourgeois parties and the Anti-Semites, have all tended to destroy the prejudice once common among the Socialists against the *Consumvereine*. Far from fighting one another, the strict party men, the labor unionists and the co-operators now join in mutual helpfulness.

The Hanover Congress (1899)

* Milhaud, "La démocratie socialiste allemande," Paris, Alcan, 1903.

* Written before the recent election, in which another gain of more than 800,000 votes was made, the official total being 2,911,317.—EDITOR.

passed, by a large majority, a resolution very favorable to the co-operators. As for the labor unions, no one has better expressed the modern Socialist attitude toward them than did Liebknecht in Bielefeld in 1893:

"The labor movement built upon economic organization alone cannot attain the goal. A labor movement built upon political organization alone cannot attain the goal. The two forms of organization are indispensable to each other. If the English had our political organization, and if we had the trade union organization of the English, then both in England and in Germany would we be victorious and hold all power in our hands."

To sum up: In proportion as the proletariat comes to a clearer consciousness of its class interests the labor movement tends to acquire the same general character in all lands. The political Socialists of Germany manifest increasing sympathies for the trade unionists and co-operators, while the English co-operators and trade unionists awake to the necessity of a political organization distinct from the bourgeois parties. The movement toward unity is proceeding rapidly; and when finally it is accomplished and the Social Democracy throughout Europe reveals within itself the three mutual forces—political, trade union and co-operative—working in full and harmonious activity, we can proudly aver that the same unity was long ago reached in the Belgian Workmen's party.

Thanks to the density of its indus-

trial population and to its central position with regard to Germany, England and France, it is but natural that Belgium should be at the head of the Socialist movement and already embody the political and social transformations which are yet to occur in the other European countries. On all sides are seen the evidences of the evolution which has taken place in our little land during the last twenty years—the growth of Socialism, the decline of liberalism, the strengthening of the conservative parties through the accession of numbers of the terrified bourgeoisie, and the consequent consolidation of the privileges of the Church with the authority of the sovereign.

As capitalism develops, as the class struggle becomes more marked, the intermediary political groups—the parties of the *juste milieu*—tend to disappear. We can foresee the moment when throughout Europe there will be but two great parties, all the rest having been absorbed. One of these will be the Social Democracy; the other, under whatever name, will be the conglomerate of the conservative or reactionary forces. Between these two parties a decisive struggle is inevitable. Whatever the vicissitudes of that struggle may be, the final outcome cannot be doubted, for as it has been well said: "Capital is the passive social element; it will be eaten by the active, which is Labor."

BRUSSELS, BELGIUM.

All the World to Her

By Charlotte Perkins Gilman

AUTHOR OF "WOMEN AND ECONOMICS," ETC.

POETS have told us, in varied bursts of rapturous confidence, that Love is enough. Happy lovers, submerged for the time being in this dominant emotion, each fondly assure the other that he or she is "all the world" to her or him. As a figure of speech, aptly describing the depth of a feeling, it is true enough. As a continuing condition it is in his case not true, fortunate-

ly; and, in her case, true, most unfortunately.

The man lives in his own place and time; he is a citizen of such a country, such a city or town. He has such a business, art, trade or profession; belongs to such clubs and societies; lives and acts in the world. This he does whether married or single, rich or poor, happy or unhappy.

Then if happy in his love, if he has a wife who is "all the world to him"—*i. e.*, all the home to him—he comes back from his work to her, and is satisfied to rest in the love and comfort of the home. As far as he wants anything of woman she satisfies him. She is loving and faithful. She is industrious and frugal. She is a devoted mother, an efficient housekeeper, perhaps even a good cook. So the man leads his life, in the home at night, in the world by day; and is content. But now let us suppose that the man, so satisfied with his wife in her part of his life-area, had no other field of life than that she fills, no other range of activity than with his dear ones in the home, his well-loved home; no other association save with his family—and callers! If she—no matter how beloved—were really "all the world" to him, would he be as satisfied with her as he is now? Could she meet all, or half, or a quarter of the needs of a man's life?

Obviously not. She fills, and fills perfectly we will assume, that part of life belonging to wife, mother, home-maker, intimate companion and confidant. But she cannot fill the rest of it—the great field where every grade of friend, companion, business relation, political associate and all the other human ties are found.

No man could concentrate his entire working life on one woman, were she Helen of Troy. His love, his home happiness, is sweetest of all else to him; but he cannot make a business of love and happiness and be content.

He works "for her" in a large, general sense; a poetic sense; but as a commercial fact he works for his employer, or, in big business combinations, meeting many other men daily, serving them, struggling with them, organizing them, helping in some way to promote the world's progress.

What he gets in payment he may gladly give his wife, and rejoice to do so—it is always, obviously, more blessed to give than to receive—but what he *does* is not done for her, but for many other people. Picture him literally "working for her"—building her house, making her furniture, sewing her clothes, cooking her food—would that content him as a business for life—were she Helen of Troy?

Could he find in this direct, unbroken service enough "world" to exercise all his faculties and satisfy his soul?

The poets may think so.

Swinburne has a poem in which a man is thus content albeit the lady of his heart had become a leper.

But we have no account of how long that frenzy of devotion lasted; whether it was a working basis for a happy marriage.

A happy marriage—for a man—means a wife who gives him all he wants from a wife—but involves also a happy working life outside. Let him sit down in his happy marriage and make an exclusive occupation of it for eighteen hours a day, and its happiness would wear thin ere long. So let the happy wife understand that she is all the world to him so far as she goes—but that he has—must have—ought to have—a wide world besides where she does not go.

How does the phrase fit her condition?

Is he "all the world" to her?

Unfortunately, yes.

And why unfortunately?

Because one man—were he Adonis, Apollo, or Prince Perlino himself—is not the world; and it strains him to be used as such.

Here is Mrs. Perlino, perfectly happy with her husband; loving him, admiring him, finding no fault with him *as a husband*; but when a husband is expected also to be a world he is open to criticism.

There are, of course, her children, perfectly satisfactory as children, but also subject to this unreasonable demand that they be the world to her.

There is the house, a good house, an extensive house, but only a crippled mouse or an unenterprising wood tick could make a world of it. Yet husband, house and children taken together, the husband bearing the brunt of it, are expected to meet this extortionate requisition—to be "the world" to her.

She must satisfy through them every want of a highly developed human being, a social being; and she diligently tries to do it.

The house she rapidly and continually traverses, filling and overfilling it with all manner of things; arranging and rearranging them with tireless enthusiasm; soiling them and cleaning them in endless

alternation—the systole and diastole of the domestic heart.

To the children she devotes herself with passion, a sleepless vigilance, an unrelaxing care. Well she knows that her status as a mother is measured by the intensity and continuity of her devotion—not at all by its results.

And the husband—the well-loved husband—if any want remains unsatisfied after the service of the house and the society of the children, he must fill it.

Every uneasy longing, every unsatisfied ambition, every craving for companionship, he must satisfy.

She, in spite of a full day of work and care, in spite of being tired, is not content.

Her occupations, her interests, her responsibilities, are deep, but not wide.

They are the first, the closest in life; but life has many more. The woman is satisfied with her husband as the man is satisfied with his wife. The mother is satisfied with her children as the father is satisfied with his. They both love and enjoy their home.

But just as the man, howsoever well pleased with his family and home, needs something more, so does the woman, equally well pleased, also need something more. Both are citizens of the world as well as members of the family, both need the larger general relations of life as well as the smaller personal ones.

It is not a question of choice between the two. The woman does not wish to give up her home and family and put a wider life in their place any more than the man wishes to make such a choice, such a renunciation. She needs the personal relation, at present, more than he does, because up to this age they have constituted her entire life; and similarly she does not, at present, need the social relations as much as he does.

The man, confined entirely to the home, finds life absolutely unbearable; the woman, most women at least, are still able to bear it; but, allowing for this difference, it remains true that a modern civilized woman has the same need for large social contrast that a man has, tho in less degree. She blindly feels this need. She craves for something she has not. She tries to wring from her present surroundings satisfaction for this craving, and tries in vain.

She needs the world—and here is this dear man who has undertaken to be that world to her.

So she wrings him.

He loves her? Yes; but, as she feels unsatisfied, it must be that he does not love her enough. Or he does not love her in the right way—on the right plane. He does not meet all the needs of her nature! (As if any one human creature could meet all the needs of any other! As if human life was a *pas deux*—a *tête-à-tête*—a simple game of pairing cards.) And—final despairing protest—he “does not understand” her! That is true enough. He does not, neither does she understand herself. She thinks it is more love she wants, or a different kind of love, and blames him for not furnishing it on demand. He thinks simply that “women are like that”—gives her what he has and goes on living.

In reality it is not further love that she needs at all, either a different brand or more of the same thing.

It is not more man, but more world—more life—that she restlessly and dumbly craves.

Failing to get it, she pushes uneasily against this well-intentioned substitute for a world and racks him with her continual demands.

One of our leading writers of stories has well expressed this position in repeated instances. She shows always some high strung and intense wife so rapturously devoted to her husband that she asks nothing of life but him—all of him and all the time.

That is, she thinks she asks nothing else. It would be a pleasant experiment to see a husband take one of these insatiate angels at her word—and proceed to make love to her day in and day out—one rampant, ceaseless courtship for years and years. Flowers, sweetmeats, theater tickets, jewels, all the more patent gifts, tributes, bribes—whatever this form of devotion may be called; constant attendance, eager and devoted; watchful observance of her wildest whim, her least caprice, her most delicate shade of feeling; the everlasting presence and ceaseless devotion of the man she loves—would this, after all, make a woman happy? Could she respect such a person—a live man who had nothing to do in life but wait on her?

Could she continue to want what she so superabundantly and unavoidably had? As a matter of fact, when occasionally a man does assail a woman with this besotted devotion, what is the effect on her?

She tires of it, of him; and, being still unsatisfied, seeks another man.

She thinks that since this oversupply of love does not after all meet her needs, it must be a different variety that is requisite.

It is not love at all—life is what she wants, good, broad, common human life, not *instead* of love, but with it, besides it, beyond it. Love is not enough. There is no living creature for whom it is really the end of existence save the male of certain insects; they have no other end, are created for nothing else—cannot even eat; they love, mate and die.

It is not true that Love "is of man's life a thing apart—'tis woman's whole existence." It is nobody's whole existence. It is a vital part of everybody's existence, beautiful, natural, sweet, indispensable—but not all. Here we have a large common ground of explanation for much of the unhappiness in marriage so general in our life to-day; under which women suffer most, and for which men are most blamed. The woman suffers most in an unhappy mar-

riage because she has no other life from which to draw strength and practical consolation. She may try to drown her trouble in religion—and religious monomania among home-bound women is painfully common—or she may seek consolation in "society," in excitement and amusement.

But a man has his work to take pleasure in, to take pride in, to gratify ambition, to obtain profit, to fill out the varied wants and impulses of his nature.

He has the world as well as the woman, and with them both gets on more comfortably. She has only the man. He is the world to her—or she thinks he is; and she makes him miserable as well as herself in trying to drag out of one never so worthy man the satisfaction which a human creature can only find in full human life. We shall have far happier marriages, happier homes, happier women and happier men when both sexes realize that they are human, and that humanity has far wider duties and desires than those of the domestic relations.

A wise fulfilment of these broader social relations will make a far more healthy and reasonable woman, and a healthy, reasonable woman will not expect of any man alive that he be to her lover, husband, friend, *and* world.

WOODSTOCK, N. Y.

Peonage in the South

[The writer of the following article is a resident of the South, thoroughly familiar with what is known as peonage, and to some extent personally interested in the peonage prosecutions. For reasons in no way discreditable to himself, he prefers that his name shall not be published.—EDITOR.]

THE recent indictment of thirty-six white men of Alabama for holding negroes in a state of peonage, by the Federal Grand Jury sitting at Montgomery, recalls the fact that Alabama is one of the States that has adopted a constitution the avowed purpose of which is to deprive the negro of his political rights under the Federal Constitution. Without his political rights the negro of the South, and also the poor white man, will soon be without those personal rights that have long been the

proud heritage of the American citizen. It is but a step from the evasion of the Fifteenth Amendment to an actual violation of the Thirteenth Amendment, an amendment that was not adopted until after it was shown by actual practice and legislation that the recently emancipated slave was fast becoming a peon, under the contract labor laws enacted by the first legislatures that met in most of the States forming the late Confederacy. To-day, after years of quasi nullification of the

war amendments, we find the South relapsing into a state of virtual slavery, in which the negro and the poor white man find their condition worse than that of the average slave of *ante-bellum* days.

Peonage is defined to be that condition of affairs in which the debtor is held by the creditor in qualified servitude to work out a debt. This condition has existed in Mexico for years. When the present Territories of Arizona and New Mexico came under the jurisdiction of Congress it was found that the local laws and customs recognized the system, and it continued until 1867, when Congress (by an act approved March 2d of that year) abolished peonage in the United States and the Territories thereof. The law on this subject is found in Sections 1990, 1991, 5526 and 5527 of the Revised Statutes. This condition of qualified servitude is prevalent in the South, and in some places the horrible atrocities perpetrated have led to the indictment and prosecution of a few offenders for violations of these statutes.

During the past few years the prosperity of the South has rivaled that of any other section. The demand for labor has been phenomenal; and employers, especially in the naval stores industry and on the plantations, have had great difficulty in securing workmen. Owing to this scarcity of workmen there has been a great demand for convict labor. In many instances persons, white as well as black, apparently without money or friends, have been arrested by the local constable and arraigned before the police or justice of the peace court. At this point it has been customary for an employer or agent of a large employer of labor to appear on the scene and induce the prisoner to plead guilty to a trivial offense, with the understanding that the employer (who is quite often in conspiracy with the court officials) would pay the fine to prevent an imprisonment. A written acknowledgment of debt is generally secured from the victim, in which he agrees to work for the person paying the fine, either on his plantation or in his labor camp. The victim is then taken to the place of labor and finds that he is guarded there like a convict. If he turns to and works diligently so as to pay off the debt due his employer, he is charged with all kinds of goods at

high prices, and the debt is held over him for an indefinite period. If, on the other hand, he revolts and escapes, he is run down, arrested without process, returned to the private prison and, probably, beaten brutally, because many of the contracts provide for all of this. "It is so nominated in the bond."

Another way of securing victims is for the employer or his agent to proceed to some town or city and to hire a lot of laborers, agreeing to pay them certain wages and their railroad fare to the place of labor, and to advance them provisions from the company store, or, as it is commonly called, the commissary. The laborers arrive, and at the outset are indebted to the employer, who sees that they trade out their wages at the commissary, and in many instances, by a system of deductions and false entries, manages to keep the laborer perpetually in debt. If the laborer has a family, so much the better for the employer; they must live out of the commissary, and if the laborer runs away his family are detained at the camp. The writer has known of an employer withholding young children from both father and mother for the purpose of forcing the payment of a debt. If the laborer escapes, the machinery of the local criminal law is put in motion to arrest and return him under the charge of false pretenses, cheating and swindling; or, in the State of Florida, under the law relating to false promises. If the runaway is arrested he is seldom tried before the courts. The arresting officer, often in the pay of the employer, induces the victim to return to work rather than go to jail, and so he returns to bondage with a heavier load of debt to carry, for the cost of pursuit and arrest is charged to him. Often no process is issued for arrest, but the employer arrests without process, returns the prisoner to his labor camp and inflicts severe chastisement. Many of the labor contracts contain provisions to the effect that the laborer consents to allow himself to be locked in a stockade at night and at any other time when the employer sees fit to do this.

About two years ago, in the State of South Carolina, a local grand jury indicted some prominent planters of that State who were working laborers under contract. The contract used in this in-

stance was a long one and the effect of the wording was such as practically to make the laborer a lifetime peon. These contracts provided for locking up at night by the employer, and the laborer also contracted with his employer to receive such punishment as the employer saw fit to inflict. The contract was published in full in the *Atlanta Constitution*. At that time it was suggested that the federal authorities take a hand in the affair, but the local authorities announced that they were competent to administer the law. The defendants were tried before a jury of their countrymen and promptly acquitted.

The first conviction under the peonage laws was that of S. M. Clyatt, of Tifton, Georgia, who, on May 24th, 1902, in the United States Circuit Court at Tallahassee, Florida, was convicted of a violation of Section 5526 of the Revised Statutes. The defendant in this case came from Georgia into Florida, accompanied by armed men, and with the assistance of the sheriff of Levy County, Florida, arrested two negroes who had run away from his turpentine farm in Georgia while indebted to him. The men were forcibly arrested, taken out of the State without legal process and forced to work on defendant's turpentine farm. At the time of capture the defendant announced that his purpose was to take the negroes back to Georgia, in order that he might make an example of them so that other employees would not run away. At the trial of this case it was developed by the evidence that the actions of the defendant were in line with the usual custom of the country regarding employees indebted to employers. The defendant introduced no evidence in his defense and the jury found him guilty. The court imposed a penalty of four years' imprisonment in the federal prison, and the defendant took a writ of error to the Circuit Court of Appeals for the Fifth Circuit. The case is still pending at this

writing, and the decision of the court is awaited with interest by the federal authorities and employers throughout the South.

Many persons are very bitter toward the federal authorities for enforcing the law prohibiting peonage, declaring that this is an unwarranted interference with their rights. The Turpentine Operators' Association has raised a fund of several thousand dollars for the purpose of testing the peonage statutes in the courts. Some have said that the prosecution of Clyatt and others was instigated by the administration for political purposes. The writer knows that such was not the case. When the first of the peonage prosecutions were instituted in the federal courts but few lawyers and United States District Attorneys in the South knew that such laws existed.

The best people of the South are opposed to the peonage system and condemn it in unmeasured terms. Many employers are opposed to it, but have been compelled to lean toward it in self defense, the local courts as a rule not protecting the laborer, and in some instances the officials receiving compensation from one employer for annoying and harassing other employers.

The writer has seen a whole family of white persons, including young children, forced at the muzzle of a gun to leave their home and return to the swamp labor camp of the father's former employer some miles distant, there to remain until a small indebtedness due the employer was worked out by the father at wages which the employer arbitrarily fixed. This case is now pending in a federal court, but it is not likely to be tried, as the Employers' Association has spent money liberally to place witnesses out of reach of the court. To say that peonage is only sporadic and temporary is incorrect; it is here in the South to stay permanently unless a strict enforcement of the law is had.

The Political Crisis in England

By Justin McCarthy

WE are indeed passing through a political crisis in England just now, and one which is in many ways more important and also more peculiar than any other that I can remember since the fall of the last Liberal Government. It is quite likely that the crisis may have worked itself through before my comments on it can have reached your readers, but even in that case the comments may be of some interest as illustrating the impression which it makes on the public mind of England at present. We here find ourselves suddenly plunged once again into the struggle of Protection against Free Trade, the very existence of which is regarded as an event of past English history by the present generation—the struggle which was supposed to have come to an end with the system of legislation introduced by Cobden and Bright and established by Peel and Gladstone. Now I shall ask my American readers to consider the bearings of this strangely revived controversy without regarding it merely by the light of their own sympathies with one side or the other. The American who believes in the principle of Protection may be able to appreciate the peculiarities and curiosities of this revived debate in England just as fully and with as much interest as the American who accepts the doctrine of Free Trade.

The most startling peculiarity about

this present disputation is that the conflict has arisen distinctly and altogether within the ranks of the administration now conducting the Government of England. Joseph Chamberlain, the Colonial Minister, is the author of all the tumult. Chamberlain came into public life and into Parliament as a devoted follower of Cobden, Bright and Gladstone on the question of Free Trade, as well as on most other public

questions. He is, as everybody knows, a man endowed with a marvelous capacity for rapid conversion. From being an extreme Radical, he suddenly became an uncompromising Tory, and now, after a lifetime of professed devotion to the principles of Free Trade, he has suddenly proclaimed himself an unqualified Protectionist. In the same Conservative Cabinet the Chancellor of the Exchequer, Mr. Ritchie, who, from his personal ability, as well as his official position, is one of the leading

THOMAS CARLYLE

members of the Government, has replied to Mr. Chamberlain by declaring himself in the House of Commons a convinced and unchangeable believer in the principles of Free Trade. Sir Michael Hicks-Beach, who was Mr. Ritchie's predecessor as Chancellor of the Exchequer, and who resigned his place in the administration because he could not prevail upon his colleagues to accept his views as to a policy of economy, has joined with Mr. Ritchie

in publicly condemning Mr. Chamberlain's new and sudden declaration of policy. Several members of the Government have made it known that they, too, go with Mr. Ritchie and against Mr. Chamberlain. The Prime Minister, Mr. Arthur Balfour, has maintained thus far a somewhat cautious attitude, and while he has given no encouragement or support to Mr. Chamberlain's views, he has not gone the length of publicly repudiating his colleague and seems inclined to treat the whole dispute as one of an academic order, which might well bear postponement to some season of less pressing business. From all that outsiders can learn, there is no leading member of the administration who acknowledges any sympathy with Mr. Chamberlain's avowed policy.

The strange spectacle, therefore, is presented to the public of an administration, one of whose leading members declares his resolve to initiate a policy which his colleague, the Chancellor of the Exchequer, utterly and publicly repudiates, and yet these two leading men continue to hold their offices in the existing Government. Of course, it often happens that some influential member of a Cabinet differs from his colleagues, or the majority of them, on a question of paramount importance, but we all know what has hitherto always happened in such a case. The statesman who cannot agree with his colleagues on a question of such moment resigns his place in the Government and fights his battle as an unofficial member of Parliament. The instance of Sir Michael Hicks-Beach is close at hand. Sir Michael was Chancellor of the Exchequer in the existing Government, and when he could not get his colleagues to agree with him as to his proposals for a more economical system of administration he promptly resigned his place in the Government and became a private member. Up to the time at which I am writing Mr. Chamberlain has given no indication of any resolve on his part to withdraw from the official companionship of men who publicly repudiate his doctrines. Mr. Chamberlain's friends no doubt would say that the Prime Minister has not publicly disavowed or condemned the

policy proclaimed by the Colonial Secretary, but then it has to be taken into consideration that Mr. Balfour listened to Mr. Ritchie's condemnation and disavowal of it and in the speech which he delivered almost immediately after never said a word to show that he did not share Mr. Ritchie's opinions.

A fact of some importance in the present situation is the position just taken by Lord Rosebery. Only a few weeks ago Lord Rosebery was thought by most people to be somewhat uncertain in his Free Trade faith. In one speech delivered lately he went so far as to say, after his humorous fashion, that the doctrine of Free Trade had not made any part of the Sermon on the Mount. But now Lord Rosebery has just delivered a speech in which he declares himself to be opposed to Mr. Chamberlain's policy of preferential duties, and expresses his conviction that Free Trade is absolutely necessary to the prosperity of the English people. As everybody knows, there was for a long time a prevailing impression amongst political observers that a Cave of Harmony might soon be found in which Lord Rosebery and Mr. Chamberlain might combine to offer shelter to a new Parliamentary party. Now we suddenly hear from Lord Rosebery's own lips that he will have nothing to do with Mr. Chamberlain's new policy, and that the Colonial Secretary must look out for himself if he is determined to put his professions into practice.

There then arises the question of the hour: Is Mr. Chamberlain determined to put his professions into practice. If he is not, if he has merely said his say, is content with having relieved his conscience and will take no further action, then the Ministry may carry on its course without any further disturbance. This, in fact, would seem to be the result which Mr. Balfour was endeavoring to bring about when he somewhat vaguely conveyed to the House of Commons the idea that he could not accept Mr. Chamberlain's policy, but thought it would be convenient to postpone the consideration of such a question to a less busy time.

But then is it at all likely that Cham-

berlain proclaimed his new principles out of mere lightness of heart and without any particular concern for any result to come from the proclamation? I cannot believe that Mr. Chamberlain is in any sense a man likely thus to make play with his political utterances. I cannot doubt that when he made his announcement he had deliberate purpose and personal object in pronouncing it, that he was determined to follow his words with actions and to accept the consequences. I take it that Mr. Chamberlain is growing dissatisfied with his position in the Government, and is impatient of the comparatively subordinate part which he has to play. Ambition has always been his idol, and it is quite possible that his ambition would lead him just now rather to become the leader of a new political outbreak than to hold his official place quietly obedient to ministerial discipline. I cannot help believing that Mr. Chamberlain is highly delighted with the whole situation. Everybody here is talking about him just now, and the whole prospects of the Conservative Government are regarded as depending for the present on the course of action which it may please him to adopt. If Mr. Chamberlain is not proud of such a position and determined to keep the attention of the public still fixed on him as on the one most important figure in the political crisis, then I can only say he is not the man I take him for.

The revived controversy about Thomas Carlyle and his wife has been a melancholy event, and might almost be set down as a public scandal. For myself, I can only deeply regret that the name of Froude should be once again involved in such a controversy. I had the honor of knowing Froude, and was always fascinated by the charms of his manner, his delightful conversational power and the animation with which he could throw himself into any subject that happened to come up in conversation. But any one could have seen that Froude was not a man especially gifted with calm, critical judgment and a faculty for the cold and judicial measurement of facts and evidence. He had a quick fancy and a strong and even a humorous delight in lending new point

to old testimony and in working up even the most commonplace materials to a telling and a picturesque purpose. This temperament of his was indeed made manifest habitually in his historical writings, and brought on him much severe and not undeserved criticism. I can easily understand that when he thought Carlyle in the wrong during some of the Carlyle matrimonial disputes he might easily and without the slightest consciousness of exaggeration have allowed himself to become an extreme partisan of the other side, and to convert the most insignificant scraps of evidence into conclusive testimony in support of his own views. But every one who knew Froude knew that he had a kindly heart and a generous spirit, and it is much to be regretted that he should have allowed himself during his lifetime to be involved in such a controversy. Still more is it to be regretted, according to my judgment, that any friends of his should long after his death have thought it right to add new contributions to his share in this melancholy and deplorable debate. The whole dispute involves no question with which history is bound to concern itself, or which affords any justification for an unseemly argument over the graves of the dead. Sir James Crichton-Browne, whose "Letters and Memorials" of Mrs. Carlyle have brought up this recent controversy, is a man of high distinction in the medical profession, a man whose character renders it impossible to believe that he could have had any but the best motives for reviving the dispute, and yet I think the world in general will feel a profound regret that the grave of this family scandal should have been reopened.

Among our recent literary productions there is one to which I feel bound to invite a special attention. It is a story called "All On the Irish Shore," and is the joint work of the two ladies who describe themselves in literature as Miss Ross and Miss Somerville. These ladies are the authors of "The Real Charlotte," a novel which won for them a sudden and well merited celebrity some years ago, and of many subsequent novels which well maintained the fame of that first effort. "All On

the Irish Shore" does not perhaps make as high a claim to a place in the literature of fiction as "The Real Charlotte," but it is not too much to say that the light of genius is in it. It is a collection of intensely amusing and humorous sketches of certain fields in the Irish life of the present—chiefly, that is to say, in the life which has to do with horses, dogs and sport of all kinds—and it sparkles from first to last with genuine comedy, all the more genuine because it is here and there varied by some tender tones of pathos. I think I was one of the first to call the attention of THE INDEPENDENT and its readers to the writings of these gifted women, and I am glad to be able to say that this, their latest production, deserves the cordial welcome of all who can appreciate Irish humor.

Mr. Fisher Unwin is now publishing a new series of books called "The First Novel Library." The idea is that this series is to be made up exclusively of first efforts—the first novels, that is to say, of writers whose first attempts seem to have exceptional promise. The latest volume of this series bears the somewhat startling title of "The Flame and the Flood," and the author is an-

nounced as Rosamond Langbridge. The story assuredly does not want for thrilling effects and intense conflicts of emotion, and it might be appropriately dedicated to "Music, Heavenly Maid," so intense is the sympathy of the authoress with every musical touch and tone and passion. Critics and readers will probably dispute keenly over this volume of fiction, but it is something to get a new volume of fiction which is worth such a dispute.

Mr. Percy Fitzgerald, who might almost be described as the literary executor of Charles Dickens, is publishing in a Rochester newspaper a series of articles which are likely to be read with deep and general interest in the United States, as well as in England. The articles are entitled "Rochester and Charles Dickens," and as will readily be understood they form a guide to the associations between the real life and the real home and the imaginary characters of the great novelist. These articles will, I presume, be published more lately as a volume, but in the meantime I cannot refrain from calling the attention of my American readers to the fact that they are already appearing in print.

LONDON, ENGLAND.

The Chaos of Criticism

By W. J. Ghent

AUTHOR OF "OUR BENEVOLENT FEUDALISM"

FROM Dionysius of Halicarnassus to Dryden, and from Dryden to George Saintsbury, there have been many and notable critics of prose and verse. Some of these, holding no doubt with the "flowing philosophers" that

" . . . all things are as they seem to all,
And all things flow like a stream,"

have sought to make opinion the sole guide and have flouted the existence or possible creation of fixed standards of criticism. But most, it may be said in a general way and without looking too curiously into particulars, have aimed to establish fundamental principles, and

out of these to create permanent and relatively uniform standards. Whatever the main results of two milleniums of literary criticism may be, it can hardly be said that approach toward uniformity of judgment applied to contemporary literature is one of them. Our critics not only differ immeasurably in their estimates, but they show small acquaintance with common standards, or at least small inclination to appeal to them. Nowhere is more clearly shown than among the craftsmen of criticism the truth of the maxim that what is one man's meat is another man's poison. What enchants one enrages another; and it would seem

that commendation, like kissing, as the late William of Avon observed, still goes by favor.

From the social standpoint—a vantage ground increasingly used by great numbers of people—this situation can be viewed only with grave disapprobation. Since all labor and all recompense are coming to be recognized as social, the question of what society gets for any given expenditure of its money is increasingly important. The part of the national income yearly set aside for the work of pronouncing judgment upon current books is enormous. It is true that many of the persons employed in this work receive but the merest pittance. Some, indeed, receive only the books which they review, and even those grudgingly. But others are better paid, and the total expense to the nation may be said to equal a prince's ransom. The publishers alone, in gifts of books for this purpose, probably expend a million dollars a year. Now if, in return for this vast expenditure, society gets no adequate return—if, looking for light, it gets only shadows with intermittent glimmers—it is evident that there is great social waste. If it pays so largely to get accurate judgments on the latest novel, and out of two hundred reviewers no two of them say any similar thing about any phase or quality of that novel, there is grave need for reform. In the words of Franklin, society is paying too much for its whistle. Under the coming Socialist *régime* the National Literary Board may take prompt cognizance of this condition and place criticism under the classified civil service, or, that failing, may, with something of Hamlet's impatience, "reform it altogether" by cutting off all expenditures for its maintenance.

Not very long ago a person, who may for present purposes be designated as a friend of the writer, published a book. It had to do with the socio-economic situation, with incidental touches upon such living problems as what to do with the trusts, labor societies, lawmakers, judges, editors, preachers and other companies and classes of men sometimes regarded as incubi on the body politic. Generously as to space, often ungenerously as to manner, the press gave it

mention. It was a first book, and naturally the author looked to the judges of literature for sound and helpful criticism. But viewed as an appeal to the Areopagus of the Republic of Letters, nothing could have been more futile. For those who sat in judgment not only failed to agree with one another, but in many cases even with themselves. There was no aspect of the argument which was not variously viewed, and there was scarcely a judgment expressed in any quarter which was not contradicted in some other. On top of this it occasionally happened that the same review expressed two or more diverse and contradictory judgments. An almost complete absence of common standards—or of acquaintance with them—for the judgment of style, tone, temperament, argumentation and accuracy was indicated.

There ought to be, by this time, some available standards for measuring an author's style. If so, they must at present be laid away somewhere, as the prototypes of the yardstick and the meter are locked up in an official case at Washington. The estimates, in this case, are nearly all diverse. "The style of Mr. Blank's essays is colloquial and almost frivolous," emphatically remarks the *Philadelphia Public Ledger*. This is hard, but a measure of relief is given by the statement of the *Boston Herald*, that it is a "breezy, but trenchant style." Nothing of breeziness is discovered by the *Boston Advertiser*, which finds that the book is written in "terse, dignified English." All of these estimable persons are wrong according to the reviewer of the *Pittsburg Chronicle-Telegraph*, for the book is "written in a declamatory style." It is yet, according to the same authority, as "readable as a novel," a judgment which may be thought rather severe upon the conventional style of modern fiction. The book is written in "an energetic, lucid style," according to the *American Hebrew*, while, according to the *New York Times Saturday Review*, the author "understands the art of statement, of illustration, of suggestion and of literary allusion." But the *New York Mail and Express* has a very poor opinion of both style and contents, and as if at the same time to rebuke the author and to illustrate to him the correct

manner in which to write, puts forth the following luminous and elegantly constructed sentence:

"The writer starts out with a cipher . . . and plunges into a mass of material, coming out on the other side, to change the figure, with a goodly store of metallic fragments which his magnet has attracted."

The temperament of a book ought not to be, one would think, so distressingly difficult a matter for determination. Yet in this matter, as well as the former, the critics fail to agree. The author "approaches his subject with a certain cynical skepticism," observes the *Brooklyn Eagle*; and here, for once, a partial and approximate agreement is reached, for both the *Indianapolis Journal* and the *New York Mail and Express* incline to the same view. The *New York Evening Post* discovers "urbanity" to be the dominant tone, and a number of journals light upon various temperamental qualities, most of them far removed from cynicism. But it is on the determination of the author's pessimism or optimism that many cerebral neurons are pumped dry. "He is an avowed pessimist," blithely remarks the *Philadelphia Public Ledger*. "The author is somewhat pessimistic," says the *Grand Rapids Herald*, "but he is hopeful for the future"—a rather enigmatical declaration. "The book is not on the whole pessimistic," is the guess of the *Worcester Spy*, while the *New York Herald* declares that it "veils a passionate but despairing hope for something more in accordance with his ideas of justice between man and man." One of the editors of the *Nebraska Independent* evidently inclines to the view that the author writes with a purpose not wholly divorced from optimism, since the hope is expressed that the book may be "to the overthrow of baronial power what 'Uncle Tom's Cabin' was to the overthrow of the slave power." But the staid and unhumorous *City and State* of Philadelphia declares that "it presents a narrow and hopeless view which, by paralyzing all energy and enthusiasm, would bring the fulfillment of its worst prophecies."

Opinion has legitimately but the narrowest range in judging an author's accuracy in the use of facts and figures.

It is knowledge that is needed. One need not be a Gradgrind to know that there exist both in science and sociology certain masses of authenticated data. When an aspiring author ventures to use any part of these; the function of criticism would seem to be to determine whether or not he has correctly performed his task. Knowledge is the one thing needful; and when the critic possesses enough of this to discover an author's lapses, it is his obligation to set down chapter and verse. Guesses are nothing to the point, and sweeping generalizations regarding an author's "inaccuracy" are not criticism, but are too often merely attempted disguises of an abundant lack of information on the part of the critic. Yet in passing upon the data of the book in question, both guessing and bankrupt generalizing were heartily indulged in. There is a fine boldness, qualified somewhat by a notable prudence in withholding a bill of specifications, in the declaration of the *Philadelphia Press* that the author's argument is invalidated by "his looseness and inaccuracy in dealing with established facts." *Gunton's Magazine*, whose editor, Mr. George Gunton, is a manufacturer and wholesaler of a particular brand of economics at his shop in Union Square, is equally sweeping. "He [the author] plays and even dawdles with statistics. . . . Such writing is mere fustian; it is a dawdling with data which makes them misrepresent the truth." Somewhat grudgingly *The Advance* is moved to concede "that Mr. Blank has uncovered a great many facts in his book no intelligent observer will deny," and the careful *Review of Reviews* refers to the book's "statements of social and industrial facts of the freshest interest and importance." Some of the critics are even warmer in their commendation. "Its estimate of current industrial and economic tendencies is unanswerable," writes Mr. Willis J. Abbot in *The Pilgrim*; "It is remarkable for its painstaking study of economic statistics," writes Mr. David Saville Muzzey in the *Ethical Record*, while Prof. Goldwin Smith, in the *Toronto Weekly Sun*, avers that "Mr. Blank cannot be contradicted when he asserts that the multimillionaire in a wealth-worshipping age has everything

pretty much in his power—legislatures, judiciaries, churches, ministers and, perhaps worst of all, the press.” Nothing of this will do for Prof. Charles Richmond Henderson, of the University of Chicago, who, in his article in the *Journal of Sociology*, while graciously admitting that “many of [the book’s] illustrations . . . seem to be based on knowledge,” yet resolves a great part of them into “venomous accusations.” And our old friend, the *Boston Transcript*, to which we return again with pleasure, finds that “on analysis, however, the work is seen to consist of many ingenious assertions and some carefully collected statistics, which prove nothing so much as Disraeli’s classification of falsehoods as ‘first, lies; second, d—d dies, and third, statistics.’”

The Socialist reviewers generally admit the correctness of the data. But, with a penetration greater than that of their non-Socialist brethren, they discover that the work is not original. Both facts and arguments have all been furnished before by themselves or their forbears. “If we Socialists,” urges the *New York Worker*, in pointed reproof, “have been proclaiming the same truth for many years and have called attention to most if not all of the illustrative facts he uses,” why, then, Mr. Blank should have made more candid acknowledgment. Mr. Wilshire, in his sprightly magazine, makes no allegation of lack of originality when he speaks of “the wealth of illustration and the multitude of facts” which the author adduces; but his failure to do so is more than made up by the ingenious editor of the *International Socialist Review*. “The Socialist reading [the book] will, in the first place, be somewhat amazed at the lack of originality. . . . There is scarcely a position in it that is not set forth in the ‘Communist Manifesto,’ to say nothing of the other writings of Marx and Engels and the host of Socialist writers that have followed.” This is interesting, but nothing like so interesting as what appears a few lines further along; for there it is set down that “the whole book is written from a little-capitalist class attitude.” A book, all the positions of which have been taken from Marx and Engels, which should yet be written from “a little-

capitalist class attitude” would indeed be a curiosity; and I may echo the good poet Cowper’s prayer, that when such a book is found,

“May I be there to see!”

Diversities of opinion regarding argumentation are more excusable. For both reasoning and the judgment of other men’s reasoning are processes apparently not reducible to law. They respond but feebly to cultivation; they must be born and cannot be made. Reasoning, Dogberry might have said with truth, comes by nature. “The more we compare individual with individual,” wrote Macaulay in his “Lord Bacon,” “school with school, nation with nation, generation with generation, the more do we lean to the opinion that the knowledge of the theory of logic has no tendency whatever to make men good reasoners,” or, as he might have added, to make men good judges of reasoning. It is, therefore, with no hint of remediable deficiencies in the critics that there are here set down a few of their diversities of opinion on the matter of argumentation. The thing is not to be helped; and the present evidences are recorded merely as a psychological curiosity. The author presents his case in “a dispassionate, indisputable manner,” says the *Providence Journal*. The *Boston Transcript* will not have it so; the book is “illogical, improperly based and unfair.” The *New Orleans Picayune* counters with the statement that “the argument is pushed home with telling logic.” One of the pundits of the *Yale Review* waives the question of the accuracy of the statements, but declares that “it is the interpretation of the facts that calls for criticism.” On the other hand, a writer in the *San Francisco Bulletin* avers that “Mr. Blank arrives at his conclusions with the precision of a machine.” “Clear thinking,” is the verdict of the *Boston Herald*; “Mr. Blank is completely hypnotized,” says the *Burlington News*. The convincing Mr. Herbert Croly, in *The Reader*, argues that since the author “has loaded so vast a conclusion upon so restricted a foundation he must pardon his critics for believing that this conclusion is more a matter of personal faith than impersonal demonstration.”

Yet he is "a very logical and dispassionate writer," according to the *New York Freeman's Journal*, even tho, according to the sapient *Literary Digest*, he is "so weak in his conclusions that the reader has the uncomfortable feeling that he is being taken in by a clever burlesque." The ordinary reader may think that for a burlesque so clever that he has been "taken in" by it, something else than weak conclusions would be necessary; but the point must not be insisted upon. High authority has spoken, and it should not be questioned. Yet despite such authority the *Journal of Education* ventures to say that the book is "a broad and philosophic study," and the *Open Court* that it is "a calmly presented view," both of which tributes would seem to imply the belief of at least an occasional use of logic on the author's part. Some of the critics make much of the singular point that the author has selected his statistics—as tho his obligation were to make no selections. "The fact is," says the satirical *Evening Sun*, "the author, by a sifting process, turns everything to his purpose;" and *The Outlook* declares that "as he proceeds with his task [he] more and more gives evidence of selecting the facts which support his contention." Finally comes the *Living Church*, which querulously asks, "Why cannot social reformers and writers of little books on such questions eschew exaggerations and extremes?"

Contrarieties of judgment show better when dealing with masses than with details. It is when the critics come to general conclusions that they reveal at once how sweeping their judgments can be and how extreme a range between praise and censure they can command. "The book falls easily into the Mrs. Gallup class," witheringly exclaims the *New York Mail and Express*, in ungallant disregard of the feelings of one of the latest contributors to the Baconian theory. Mr. Wilshire holds another view. "Tho I do not agree with Mr. Blank's conclusions," he writes, "I must say at once that I regard his book as the most valuable contribution to economic literature that has yet appeared in America." "It is composed of cheap raillery," says the *Philadelphia Public Ledger*, "which will not need very careful consideration

by serious men." The book, writes Mr. Wallace Rice, in the *Chicago American*, "ranks as one of three books which every American should have at his fingers' ends." It "presents us with a picture of modern society," says the *Dial*, "which recalls the occasion when one has seen one's reflection in a door knob. The reflection was grotesque in the extreme, but unmistakably represented one's physiognomy." "Whatever else may be said of the book," is the opinion of the *Review of Reviews*, "it is a wonderfully vivid picture of the industrial life of our time." "The book is a caricature upon present conditions," declares the *Indianapolis Journal*. "In our opinion," writes Mr. J. H. Dillard in *The Public*, "no book on social problems has appeared recently which is more worth reading." "Just why this book was written is not clear on first reading," is the expressed judgment of Mr. Gunton; ". . . it could not have been written for the purpose of really informing the reader of any important subject affecting the welfare of society." "The work is, however, one to be read by all students of the industrial problem," says the *American Hebrew*. A somewhat nebulous utterance in Mr. Horace Traubel's *Conservator* must needs be given. "Blank gets along well enough with the nerves and tissues," it reads, "but misses on the soul. He has a certain talent for diagnosis, but he does not possess as much talent for treatment. . . . He demands that we be practical. But his practicability lands him nowhere. He winds up in the lumber heap." Exactly what all this means must be left to the reader; but it is well to point out that the identity of "nowhere" and "the lumber heap" has now been established beyond cavil. Another somewhat enigmatical sentence comes from the *Annals of the American Academy*. "The author fails to recognize," it says, "that blind fatalism is gradually losing its hold on society." What this has to do with anything in the book would be a difficult matter to explain. But as an indication that the reviewer sacrificed very little of his valuable time in reading it, the sentence is sufficiently illuminating. Another judgment which ought not to be omitted from this list is

that of a certain Eastern newspaper. "All that Mr. Blank has proved," it remarks with what is apparently a pointed intimation, "is that among the American people are a certain number of half-baked intellects, and that 'a little learning is a dangerous thing.'" Lest from some irreverent quarter the statement be interpreted as confessional rather than accusatory, the name of the journal is withheld.

When doctors disagree and soundest casuists doubt, as Pope asked, who is to decide? For the author of a book on controverted questions it is a hard matter to determine. But it is perhaps best that he make his own selection of those fittest to judge, excluding others, as Darwin chose Hooker, Lyell and Huxley to pass upon his "Origin of Species," or as Matthew Arnold suggested Hawtrey, Thompson and Jowett to determine the merits of Homeric translations. If such judges—chosen not out of friendship, but by reason of a recognition of their ability—commend, he may rest his case in contentment, even tho the remainder of the critical world condemns. But if he inclines to a reviewers' plebiscite rather

than to the sound judgment of a few, he must expect the widest range of contradiction between praise and blame. Amid the mass of this criticism he must expect to find much which is helpful neither to himself nor the reader. He will find, of a surety, reviewers who, like Lewis Carroll's Gardener, are prone to mistake a work on economics for "the middle of next week," and others who in such a work are forever looking for the snark or the boojum of Socialism or Anarchism, but who unfortunately on discovering the boojum are *not* swiftly and silently wafted away, but are only whetted in appetite for more discoveries. He may smile at these instances, in a sad and sickly way, or he may foolishly get angry or indignant. Foolishly, it must be said, for there is no help for the present situation until the State takes over criticism as a public function, or, at least, organizes it under strict rules of examination, as medicine, law and steamboat inspection are organized. Not until the critic is compelled to pass an examination as severe as that of a boiler inspector will the trustful and confiding author and the patient public get their just dues.

NEW YORK CITY

Women as Advocates

By Grace Denio Litchfield

AUTHOR OF "THE MOVING FINGER WRITES," ETC.

[Mrs. Foster, wife of the Senior Warden of St. Andrew's, is calling upon Mrs. Cartwright, wife of a newly elected vestryman of that parish.]

Mrs. Foster [in her most positive manner]: My dear Mrs. Cartwright, Mr. Witherspoon is the last man to call to St. Andrew's. I have fully made up my mind that my husband shall vote against him for the Reverend Seabury Green, and once I determine a thing I never change.

Mrs. Cartwright [wondering what on earth induced her visitor to wear so unbecoming a bonnet]: Nor do I. Not ever. So we *must* have that nice little Mr. Witherspoon. It was fascinating

the way in which he leaned over the pulpit last Sunday and told us what shocking sinners we were, showing all the time that he did not think a bit the worse of us for it. As to that creature who preached in the afternoon, that odious Mr. Green, why I should not sleep the week through if I had him pointing his ugly, uncompromising finger at my poor, innocent peccadilloes every Sunday.

Mrs. Foster [solemnly]: Then, my dear woman, Mr. Green is the man you need. We all need him to stir us up unsparingly, and bring our sluggish consciences to the surface.

Mrs. Cartwright: But suppose he

should not smooth us back again? It would be like living inside out. I hate raw seams. Besides [remembering that Mrs. Foster is Low Church], Mr. Green is too High.

Mrs. Foster [quickly]: Where did you hear that?

Mrs. Cartwright [who has not heard it]: Oh, I know he is. I feel it. Mr. Cartwright says it is wonderful the way I always know. He says I am a perfect kangaroo for jumping at conclusions. Mr. Green is very High.

Mrs. Foster [sharply]: I know for certain that he is not.

Mrs. Cartwright [pleasantly]: In a month's time he would have you a howling Romanist, kissing the Pope's toe. The man is a Jesuit.

Mrs. Foster [indignantly]: What ground have you for that assertion?

[Mrs. Cartwright, who has none, raises her eyebrows, purses up her lips and maintains an impressive silence. Mrs. Foster leans forward, incredulously expectant. Both ladies look at each other fixedly. Mrs. Foster makes up her mind that the husband of so silly a little fool as Mrs. Cartwright has no business in the vestry. Mrs. Cartwright makes up her mind that the feather in Mrs. Foster's bonnet is her last year's one, dyed].

Mrs. Foster: Well?

Mrs. Cartwright [recollecting herself]: Oh, well, then, because.

Mrs. Foster [with dignity]: Do you consider that a reason?

Mrs. Cartwright [defiantly]: It is as good as any. Besides, look at his nose. It is jesuitical to the tip. And it is very significant the way he trims his fingernails. At any rate [warming] he is not a safe man, while the Reverend Mr. Witherspoon might preach every day the year round without his sermons hurting a soul.

Mrs. Foster [grimly]: Or without redeeming one. No. Mr. Green may make you feel low in your mind, but—

Mrs. Cartwright [triumphantly]: That is a point against him! It is High Church to make you feel low.

Mrs. Foster [severely]: On the contrary. It is the orthodox effect of sound doctrine. I never was so spiritually prostrated as after hearing Mr. Green. I did

not open my lips the evening through, tho Mr. Foster was possessed to talk to me. Now that is the sermon calculated to regenerate. It resolves life into a perpetual Good-Friday.

Mrs. Cartwright [whose chest gets weak every Lent, necessitating a visit South to a Presbyterian friend]: Gracious! I should prefer an eternal Shrove-Tuesday and pancakes. How can you think of Mr. Green? Did you time his sermon? Forty-nine minutes, as I live! And Mr. Witherspoon got to the "And now" in fifteen. I had time for a good stroll down Main Street before luncheon. That is when I study up the fashions. You can't get many ideas in church. Things look so differently sitting, don't they? [A pause, during which she wonders if standing could benefit the hang of Mrs. Foster's skirt. Her thoughts returning to the matter in hand, she has an inspiration.] And then Mr. Witherspoon has such a darling little wife—so timid and frightened-looking—not one to be putting in her oar at Dorcas Societies and Guilds. She would let every one go her own gait without a word.

Mrs. Foster [who is stroke oar in all the parish organizations]: What? Was that Mr. Witherspoon's wife? I took her to be his sister. Well, well [reflects]. So that is his wife? She looks very modest and retiring—just the wife for us. Now that I have everything running so well it would be the greatest mistake for some meddlesome, domineering creature to assume command and undo all my labor.

Mrs. Cartwright [following up her advantage]: To be sure. To be sure. A terrible mistake. Let us call Mr. Witherspoon. Mrs. Witherspoon won't be one bit bothersome.

Mrs. Foster [hesitating]: My one objection to Mr. Green is that, being unmarried, we can't know what sort of wife he may ultimately saddle us with.

Mrs. Cartwright [blankly]: Oh, isn't Mr. Green married? I thought he was. Those ugly men usually marry young, for fear the next girl won't have them. So he is not married. Why did you not say so before? That is a great point in his favor. Really, it entirely alters the case.

Mrs. Foster [tapping her friend's knee with her parasol]: No, my dear, the case

is altogether altered as *you* put it. I am perfectly amenable to argument. I admit that Mr. Witherspoon's wife is a conclusive point in *his* favor.

Mrs. Cartwright: Oh, no! Unmarried clergymen always take so much more interest in the individual soul. They don't lump you with the congregation as the married ones do. Besides, there is Emmie Burton; she is so exactly suited—

Mrs. Foster [severely]: Every priest should be a sworn celibate. The church does not need husbands. But so long as celibacy is not enjoined—and even the best of the clergy *will* marry, my dear—it is each one's bounden duty to marry before ordination. Then a congregation could judge of the fitness of the wife before calling him. Whereas in the case of a bachelor no human being can foretell what manner of feminine affliction he will ultimately fasten on his unfortunate parish. And that is the kind of practical joke he usually plays upon it just as soon as he has gotten his installation sermon off his mind.

Mrs. Cartwright [meditatively]: And he is most likely to choose a girl from the parish he is called to, isn't he? Men are always struck by new faces. If we call Mr. Green—

Mrs. Foster [irritably]: Like as not he would marry Mary Harper. And a more officious, self assertive, ambitious, godless— This Mrs. Witherspoon, now, seems a remarkably humble-minded, self effacing, biddable, little woman.

Mrs. Cartwright [remorselessly abandoning the Witherspoon party]: James shall vote for Mr. Green. Mr. Green is *the* man for us. How strange that I never suspected he was unmarried. That accounts for Emmie's thinking him divine. It really would be an excellent match for her. Being a relative she is on my mind, you see, and she is simply cut out to marry into the church. I always told her that she would never look at a man who hadn't a prayer book in his hand when he came courting, with his finger keeping the place open at daily service.

Mrs. Foster [deliberately deserting the Green faction]: Mrs. Witherspoon is the one for St. Andrew's. What a relief it will be to her to leave everything in

my hands. Yes. Mr. Foster shall certainly vote for her husband.

Mrs. Cartwright: But, really, he mustn't! Indeed, he mustn't! I have fully determined that James shall vote for Mr. Green.

Mrs. Foster: No. No. Mr. Green is *too* doctrinal—*too* dogmatic.

Mrs. Cartwright [recklessly]: Mr. Witherspoon is not sufficiently High.

Mrs. Foster [reprovingly]: My dear woman—

Mrs. Cartwright [winningly]: Now, my dear Mrs. Foster—

Mrs. Foster: Cannot you see—

Mrs. Cartwright: Cannot you understand—

Mrs. Foster: Mr. Witherspoon—

Mrs. Cartwright: Mr. Green—

[Both ladies talk volubly and excitedly for the next five minutes, neither hearing anything said by the other. Mrs. Foster's breath gives out first.]

Mrs. Cartwright [in possession of the field]: Which proves that *nobody* but Mr. Green can be called. I am sorry his name is Green. But Seabury redeems it. Wasn't there a Bishop Seabury once? Mr. Green will be a bishop, too. Being a bishop runs in families, doesn't it?

Mrs. Foster [rising stiffly to leave]: I regret to appear unamiable, but where a principle is involved I am adamant. It is a matter of conscience with me that Mr. Foster shall give his vote for Mr. Witherspoon. Nothing can change me. Surely with meditation and prayer you will come to see the right of it, and lend him your influence, too.

Mrs. Cartwright [with a sidelong glance at her friend's skirt, and the pleased discovery that it hangs even worse standing than sitting]: My dear, I never meditate, and I never—oh, yes, I *do* pray. But I never, *never* go back on myself. My influence shall all be for Seabury Green.

[Enter a third lady.]

Ah, here is Mrs. Jenkins. Dear Mrs. Jenkins, *do* tell Mrs. Foster that her husband must vote for Mr. Green. She says he shall not, because of Mrs. Witherspoon. She wants to call Mrs. Witherspoon, she likes her so much.

Mrs. Jenkins [surprised]: Mrs. Witherspoon, did you say? But there is no

Mrs. Witherspoon. Mr. Witherspoon is not married. Did you mean that meek-faced, down-trodden little thing who sat in the Bishop's pew last Sunday? That was Mrs. Green.

Mrs. Foster and Mrs. Cartwright: Mrs. Green?

Mrs. Jenkins: Yes. Didn't you know that Mr. Green was married? I was at his wedding, and I have been invited regularly ever since to the christenings. They are quite anniversary parties.

Mrs. Foster [slowly]: Oh, Mrs. Green, was it? [recovers herself]. Ah, yes. An amiable, attractive-looking woman. She must be very happy with such a husband. What a preacher! That was a sermon of sermons that he gave us. Yes [calmly rehoisting her original colors with an air of never having lowered them]. The Reverend Seabury Green, seems created for just this field. My vote—I mean Mr. Foster's—shall certainly go to Mr.

Green. You may count on that, ladies, once for all.

Mrs. Cartwright [gracefully returning to her former allegiance]: Oh, no; dear, no! Mr. Witherspoon it must be! However, if your mind is made up, I suppose you can't change it. I never change mine, either. It may be obstinacy, but I never can. Good-by, then, *dear* Mrs. Foster, good-by. Strange that she should be so stubborn, isn't it, Mrs. Jenkins? A blind man could see that Mr. Witherspoon is the only one for us. You will get your husband to vote for him, won't you? Never mind Mr. Green's being your friend. Mr. Witherspoon is *so* sweet! And *so* ritualistic—I mean, *so* nice and low—I mean—well, I am not exactly sure which he is, but anyway, I knew from the minute I saw him that we *must* have him. It is wonderful the way I always know things, Mr. Cartwright says.

WASHINGTON, D. C.

Inheritance

By Danske Dandridge

I

BE still: the trees are still.
Be strong: the trees are strong.
Be glad: the trees are glad.
Fear thou no wrong.
Lie in the springing grass;
Watch the fleet clouds that pass
Over the trees.
Feel thine old Mother Earth
Thrill with the blossoms' birth:
Is not the air a-thrill?
Doth not the Sun his will?
Thrill thou with these.

II

Thou hast the Violet's right
To thine inheritance.
Take of the Oak-tree's might:
All Earth is theirs and thine:
Smile in the good sunshine.
God needs thee, fearful heart;
Thou, of His plan a part,
Sing, while the flowers dance,
Sing and be glad.

III

Let not the Crocus shame thee!
Let not the sparrows blame thee!
O, in this air of God's,
Grief dare not claim thee!

Thou, too, hast praise to sing.
Thou, too, hast gold to give.
In his own love-light
Live, God commands thee, live:
So shall thy soul grow strong;
Grief spread his vampire wing.
Scared by thy song.

SHEPHERDSTOWN, W. VA.

LITERATURE

The Philippines

THE first three volumes of an exhaustive historical collection regarding the Philippine Islands* have now appeared. They are, on the whole, highly creditable, and argue strongly for the excellence of the remaining volumes. The plan of the work is to give translations from the Spanish, French, Italian and Latin originals of the accounts of "explorations by early navigators, descriptions of the islands and their peoples, their history, and records of the Catholic missions, as related in contemporaneous books and manuscripts, showing the political, economic, commercial and religious conditions of those islands from their earliest relations with European nations to the beginning of the nineteenth century."

The first volume contains a historical introduction by Prof. Edward Gaylord Bourne; the text of the three Papal bulls of 1493 regarding the demarcation line between Spain and Portugal; the text of the treaty of Tordesillas (1494) and of the compact between Ferdinand and Isabella and John II (1495); and a number of other important contemporaneous documents bearing on the same subject, while a considerable part of the volume is devoted to accounts of the life and voyages of Ferdinand Magellan.

It is of great and lasting importance that the texts of these rare documents should be collected, translated and published, that they may be made readily accessible to all students.

The annotations and expository parts of such a work should, above all things, be impartial. What is wanted are the records, with a sufficiency of notes and references to make them readily understandable to the merest tyro in historical investigation. Historical speculations, arguments for this or that form of colonial administration, labored jus-

tification of this people and criticism of that—in fact, polemics of any sort—would seem to be somewhat detrimental to the excellence of such a work. Professor Bourne, however, in his introduction, overlooks all this, and holding a brief for the friars, breaks out into a rapturous eulogy of the ecclesiastical administration in the islands. The eagerness of his plea causes him over and over again to make unsupported statements and rash implications, and to indulge in preposterous comparisons. It would be idle to cast doubts upon either the learning or the industry of Professor Bourne; but it is only just to say that his polemical ardency too frequently leads him astray when considering the import and bearing of the data which he has so industriously heaped together. We have many instances of this in his delightful generalizations upon the people of the Philippines. "A common religion and a common government" are ascribed to them under Spanish rule, as tho between Sulu and Tagal there was a common faith, and as tho the Spaniards had actually imposed their Government upon the Sulu Archipelago or the large island of Mindanao. From the statement that the islanders "by the fortunes of war have lost their old rulers and guides and against their will submit their future to alien hands," one is led to wonder if the meaning is intended that the Filipinos actually regret the loss of their "old rulers and guides." It must be so, since these people "have been molded through the patient teaching, parental discipline and self-sacrificing devotion of the missionaries into a whole unlike any similar body elsewhere in the world." Yet, curiously enough, the United States, during these last two years, has had to exert its whole effective power in the islands to prevent the natives expelling the friars.

There is more of this kind of statement and implication in the following paragraph:

* THE PHILIPPINE ISLANDS, 1493-1803. Vols. I, II and III. [To be completed in fifty-five volumes.] Edited by Emma Helen Blair and James Alexander Robertson. Cleveland: The Arthur H. Clark Company. \$4.00 per volume.

"The Spanish policy aimed to preserve and civilize the native races, not to establish a new home for Spaniards, and the Colonial legislation provided elaborate safeguards for the protection of the Indians. Many of these were a mere dead letter, but the preservation and civilization of the native stock in Mexico, Central and South America, and, above all, in the Philippines, stand out in marked contrast, after all allowances and qualifications have been made, with the fate, past and prospective, of the aborigines in North America, the Sandwich Islands, New Zealand and Australia, and clearly differentiate in their respective tendencies and results the Spanish and English systems."

We believe it would be impossible to find in the work of any other reputable historian a sentence so compact of bad science and preposterous history. The numerical increase or decline of savage peoples in contact with civilization is treated as tho one factor alone determined. The Peruvians and Mexicans, who have probably held their own numerically in spite of the frightful massacres of Cortez, Pizarro and their successors, are thus a living proof of the benignity of Spanish rule; whereas the declining numbers of the Samoans and Sandwich Islanders, who have never been subjected to massacre, are an equal proof of the brutality of English and American rule. The Maoris of New Zealand, to whom has long been given every political right possessed by their white neighbors, are consumptive and are declining in numbers; they, too, are thus a convincing demonstration of the barbaric rigors of British rule as compared with that of Spain. Despite the numerous sanguinary repressions of Filipino revolts, the fact that the Filipinos have actually increased in numbers and that a large part of them have joined the Catholic Church proves Spain a more creditable agent of humanity and civilization than any of her colonizing rivals.

As Darwin wrote to George Rolleston in 1875,

"The facts have convinced me that lessened fertility and the poor constitution of the children are the chief causes of such decrease [of savage populations]; and that the case is strictly parallel to the sterility of many wild animals when made captive—the civilization of savages and the captivity of wild animals leading to the same result."

Tribes of a certain physiological stamina or of a certain stage of social development are found to thrive under the labor imposed upon them by white masters. Other tribes dwindle under the mere contact with civilization. The blacks under slavery, the Mexicans and Tagals under peonage, are examples of the first, the Maoris and Sandwich Islanders of the second. The factors are many and diverse, and political administration is often the least influential among them. Finally, it may be suggested that the fate of the North American Indians, whatever it has been, is hardly comparable with that of the Indians of the Spanish-ruled Antilles, and that a reading of Sir George Gray's accounts of the wars of extermination waged among the Australian savages might have prevented the loose implication of England's responsibility for the numerical decrease of these aborigines.

The introductory essay will be generally regarded, we believe, as a serious defect to an otherwise invaluable work.

English Comedy

PROFESSOR GAYLEY promises us a series of volumes giving the more important English comedies in historical sequence, with carefully edited text, commentaries, notes, etc. The plan is worthy of high praise, and if the succeeding volumes are executed as well as this first one* we shall owe no little debt of gratitude to the general editor and his collaborators. The more complete the contents are made, the better satisfied we shall be. A survey of this first volume will give some notion of the design of the series.

First stands "An Historical View of English Comedy," by Professor Gayley, extending to ninety pages of close print. Then follow the more significant of the early comedies: John Heywood's "The Play of the Wether" and "A Mery Play Betwene Johan Johan, the Husbande, Tyb, his Wife, etc.," edited by Alfred W. Pollard; Nicholas Udall's "Roister

* REPRESENTATIVE ENGLISH COMEDIES. *With Introductory Essays and Notes. By Various Writers. Under the General Editorship of Charles Mills Gayley. Vol. I. From the Beginnings to Shakespeare.* New York: The Macmillan Co. \$1.50.

Doister," edited by Ewald Flügel; William Stevenson's "Gammer Gurtons Needle," edited by Henry Bradley; John Lyly's "Alexander and Campaspe," edited by George P. Baker; George Peele's "The Old Wives Tale," edited by F. B. Gummere; Robert Greene's "The Honorable Historie of Frier Bacon," edited by Charles Mills Gayley, and Henry Porter's "The Pleasant History of the Two Angry Women of Abington," edited by Charles Mills Gayley.

It will be seen at a glance that the work has been done by thoroughly competent hands, and indeed the editors have had the minute student before their mind quite as much as the general reader. Sometimes this exact erudition has descended to something perilously near to pedantry, as in the notes to "Roister Doister," where Professor Flügel has traced the literary allusions and parallels with praiseworthy and at times superfluous assiduity. Thus, for instance, to find a parallel to Roister's "For why, no man, woman, nor childe can hate me long," in Terence's "Numquam etiam fui usquam, quin me omnes amarint plurimum," seems to us an exemplification of the less desirable side of German philology. It should be said in general, however, that the notes are admirably adapted at once to the learned and unlearned reader.

The Introductions are also good. The most notable point is the attribution of "Gammer Gurton's Needle" to William Stevenson, by a train of reasoning which is likely to prove commonly acceptable. Professor Gayley's "Historical View" is erudite, and shows an intimate acquaintance with a mass of material not easy to grasp and co-ordinate. He writes also with considerable sprightliness, but the architectonic of his work is, we regret to say, not good. The effect of the whole is mussy and leaves no clear impression on the memory. We have indeed long observed that a mixture of erudition and forced vivacity without any sufficient trained literary sense in the handling of material is the common characteristic of our college philologues.

It is somewhat amusing to observe the claim put forth for one writer after another that he is the true "Father of Eng-

lish Comedy." None of the editors seems to have understood that the real beginning of modern English comedy comes with the transition from the old septenarius and senarius to five-stress blank verse. To pass from "Gammer Gurton's Needle," with its rollicking rhythms, to the comedies in which Peele and Greene and the other university wits adopted the more formal Romance verse, is to enter into a new world. It is a striking illustration of the immense influence of form over conception in literary production. The pity is that the new writers, along with the more formal rhythm, introduced the intricate plot and subplot. "Gammer Gurton's Needle," with all its crude humor, is decidedly the best reading in the present volume, and that largely because the unity of action is adhered to so strictly. The loosening of this unity has made many an English comedy and tragedy of Elizabeth's days mighty hard reading despite the prodigality of genius it may display.

The Mannerings

WHEN "King's End" appeared several years ago the author was rated by some prophetic critics as a second Mary Wilkins; and her next novel, "Margaret Warrener," strengthened this impression. As a matter of fact the difference in the quality of their work is as marked as the difference in their points of view. Miss Wilkins's genius is autochthonous. She remains faithful in her art to certain elemental traits of New England character, while Miss Brown shows more and more interest in horticultural human nature, the artificially perfect. And in her latest novel, *The Mannerings*,* this distinction is even more marked.

The men and women in this story belong no more to one hemisphere than they do to another. They are the products of the civilizing and refining forces in the Old and New World, gathered into a country place somewhere in New England for the dramatic purposes of the author. And while this fact cannot be urged as a literary shortcoming, since the tendency of culture is to produce cosmopolitan types, it does indicate the

* THE MANNERINGS. By Alice Brown. Boston: Houghton, Mifflin & Co. \$1.50.

difference between the literary material of two authors who have one landscape in common. For Miss Brown is as tenacious of her lights and shadows upon New England ridges as ever Miss Wilkins was. And this is really the explanation of the popular impression that they have an artistic resemblance to one another. They both stretch up the same naked, wind shaken forests in winter scenes and wave the same green boughs upon summer occasions.

We recognize in *The Mannerings* the author's Olympian genius for creating women with "length of legs divine," so noticeable in her other novels. But in this volume she has chosen to demonstrate those tendencies and dispositions in women which are indelicate, abnormal, if they are not actually immoral. The result is what might be expected—suffering, fever and hysterics. Like Mr. Howells, she preys too much upon the nervous systems of her numerous heroines. It is, in fact, the peculiar literary fallacy of this class of writers that the "leading lady" invariably comes down with brain fever and talks beautifully "out of her head."

But having determined upon an analysis of abnormal degrees of sensibility in women, Miss Brown goes about her task with clinic cleverness, and proves herself one of the few profound and impartial students of her sex among female novelists. Altho five women figure in the story, the observing reader will readily perceive that only three types are represented. One is a gaunt, fierce Amazon vixen, so material, so simple that she lacks even the Pagan spirituality of passion. Another is a lovely refinement of this monstrosity, a selfish, charming, unspiritual, unmoral animal. Contrasted with these is a silent, faithful, earth-woman, large, capable and sacrificial. The other two are merely fragile feminine complements to the men they love, sweetened into accord with them by that pious self-abandonment known only to women who must mate or perish.

Now when we consider that all these women live in a common domestic relationship, with but three men introduced now and then to temper the feminine madness of their existence, the human

impossibilities of the situation are apparent. There are not enough lovers, and the women suffer the pangs of unrequited love accordingly. But worst of all, they miss the distinction of being loved; for it is a fact that most women are able to do very well in the world without loving, but not one is ever able to adjust herself to the sorrow of not being loved. Thus, the reader hurries from page to page with fear and trembling lest the unblessed ladies in the tale actually effect the morbid disasters they threaten upon themselves and society in general. And when in the end the worst does not happen, he has the injured sense of one who has been deprived of a logical conclusion.

Message and Melody: A Book of Verse.
By Richard Burton. Boston: Lothrop Publishing Co. \$1.00

Mr. Burton's latest volume of verse shows little change in poetic character over his former collections. What is noticeable as new is a clearer consciousness, not merely of the spirit, but also of the events of the times. There are several pieces in the first part of the book which seem composed with direct reference to recent matters of national policy—or should we say politics?—to wars and rumors of wars, as well as to certain new national ideas, as of Anglo-Saxon brotherhood, or whatever one may elect to call it. Presumably nobody can write verse to any extent nowadays without having learned a thing or two from Mr. Kipling—notably the trick of endowing poetry with this sort of temporal sympathy of which we speak. But while Mr. Kipling represents the official spirit, optimistic, truculent and domineering, we seem in these verses of Mr. Burton's to detect another element—a sense of the vanity of it all. For it is indicative of the tone of present feeling, outside of the few great promoters of enterprise and their immediate followers with their profound practical cynicism, that what he exhibits is the reverse of the tapestry, the things that discourage and dishearten, the "Background Group," and the like. In such a spirit is conceived the initial piece of the volume, "The Song of the Unsuccessful,"

which therefore strikes the real key of the book. It has never been pointed out how significant is this change, not so much of subject matter as of point of view, which is gradually wrought and established upon literature every now and then until, like German romanticism, it comes to be a sort of minority report or protest against the dominant influence of the day.

The Story of an East Side Family. By Lillian W. Betts. New York: Dodd, Mead & Co., \$1.50.

The Leaven in a Great City. By Lillian W. Betts. The same, \$1.50.

Mrs. Betts draws a moving picture of a typical East Side family. Starting with a boy and his mother the tale carries us through the evolution of the boy and the family that he subsequently raises in a most entertaining way. We are made to see how the human units that go to make up society on the East Side are enabled to rise above their surroundings, and to achieve what would seem to be impossible for them. Mrs. Betts has given her story realistic setting, toward the end of which, however, there is a note in minor key that carries with it some little sadness. In her studies of East Side social conditions, as continued in *The Leaven in a Great City*, Mrs. Betts has obtained her information at first hand. Her studies have been both critical and comprehensive, and the result has been a book serious in design as well as educational in result. The conditions prevailing among those whose homes are tenement houses are graphically set forth, and the influence of the working girls' clubs, the social settlements, the kindergartens, and other similar social movements is described.

The Temples of the Orient and Their Message, in the Light of Holy Scripture, Dante's Vision and Bunyan's Allegory. By the author of "Clear Round." Imported by Open Court Publishing Co., Chicago, \$4.00 net.

Such a book as this can be written, for it has been written, but it is as impossible to read as a dictionary of synonyms; we presume it is intended for reference rather than perusal. The title is startling, for what "light" Dante or Bunyan

can throw on the temples of the Orient is not clear to the unaided vision. The purpose of the book seems to be to show from unnumbered quotations that the religion of the Egyptians and Babylonians, of the Vedas and the Zend-Avesta, of David and John and Dante and Bunyan was all substantially the same. But the quotations are bewilderingly thrown together, with or without critical relationship, until one is dazed who tries to follow and test their relevancy or verify their origin. There are perhaps a hundred short sections with separate titles. That on the Tree of Life has four pages, and it wanders over the Babylonian underworld, the Greek Demeter, the Hindu Kali and the Egyptian Book of the Dead on the first half page. The remaining pages give us Parthian coffins, Genesis, Babylonian and Egyptian figures of ghosts, Japanese gateways and Paradise, the cock and the lych-gate, Mecca and the Golden Legend, the funeral of Queen Victoria, the Roman catacombs, the Odyssey, "Pilgrim's Progress" and "Paradise Lost." What can one make out of such an unassorted medley?

Jewish Forerunners of Christianity. By Adolph Danziger. New York: E. P. Dutton & Co., \$1.50.

It is a pity that this book has assumed such a misleading title, for it is sure to bring an initial disappointment and annoyance, even to those who are interested in the volume for what it is, while others, who are interested only in what it purports to be, will feel that they have been deceived, and are likely to throw it aside unread. The book should have been called, "The Makers of the Talmud," or "The Great Jewish Leaders During the Early Christian Era," for it is a series of brief biographical sketches of the great Jewish Rabbis who taught and governed between the years 36 B. C. and 220 A. D., and of these only one can in any sense be called a forerunner of Christianity. But while it gives us little or no light in interpreting the beginnings of Christianity, it gives us, what is perhaps more needed, an insight into the inner life and national consciousness of the Jewish people during that tragic period of their history,

and an understanding of the intellectual and spiritual forces that have kept alive in a people so long and so widely scattered so strong and so unique a national and religious consciousness. The author is a Jew of the most liberal type, who here includes Jesus himself among the great Jewish Rabbis, giving him, indeed, the most exalted place among that noble company. "The man Jesus," he says, "is the most heroic, the grandest, the noblest personality of all time and age." . . . "When we place his life and death beside that of the greatest of our other teachers, as Hillel, the soul expands in admiration." The volume abounds in eloquent passages, in interesting incidents, and brings us into contact with ideas and personalities that are strangely and surprisingly like those of the early Christian Church. It will serve to remove many popular misconceptions and prejudices, and will make for a better understanding of that long suffering people whose history the author describes as "the grandest expression of tragedy that the world has ever seen."

Literary Notes

ROMAIN ROLLAND, in his monograph in "The Popular Library of Art," tells all that is necessary for the public to know of the life of Millet. The man and his ideals are stamped on our understanding indelibly. We grasp the fact that the earth itself is the dumb hero of Millet's drama, man but a clod, a creature of dust, created but to return to dust, and yet we are made to see that this painter of clodhoppers is essentially classic in method, that he is a master of style, fitly ranking with Mantegna, Michael Angelo and Poussin. (Dutton, 75 cents net.)

....To judge from the following example, "Between the Lights," by Alice Herbert (John Lane, \$1.00), contains verses of considerable distinction for a new writer:

THE LAST WORD.

Now she is dead, all you who say you love her,
Ere you forget and pass and love again,
This be the parting word you breathe above
her:

"No beauty ever lived for her in vain."

She loved the sin and sorrow of the city;
She loved the echoing woods and quiet sky.

Small good did she. But in her heart was pity
For all who live to suffer Life and die.

For her Life meant the stress of utmost living.
Wild was the heart that lies so still to-day.
She gave with such a joy of reckless giving
That we forgave her all she took away.

Pebbles

HAVE you been suggested for vice-president?—*Atchison Globe*.

....Many people are so busy attending lynching bees that they have no time to attend meetings to draw up protests against the way the Sultan permits massacres to be held.—*Atlanta Constitution*.

....The Williamsburg *Star* came out as an eight-page paper this week. Barring the fact that two of the pages were upside down and another was an absolute blank, the typographical appearance was neat and attractive.—*Chanute (Kan.) Sun*.

....In order to be really effective a social worker must be good looking. The face itself does social service.—*Last Week's Charities*.

'Twas in my father's new red barn
One glorious summer day,
I sat amidst the lowing cows
And puffed upon the hay.
And as the volumed smoke arose
Like incense on the air,
I breathed a sigh because, forsooth,
It was my first cigar.

—*Yale Record*.

....*Reporter*: Mr. Cleveland, suppose the Democratic convention next year should nominate you for the Presidency—would you accept the nomination?" *Distinguished Statesman*: "Young man, to reply to that question in a candid and straightforward manner, I have no hesitation in saying that the contingencies of politics are so uncertain, and the issues so involved, that it becomes a serious matter whether or not a man who may be said to have retired from politics is warranted in assuming that a convention will or will not pursue a certain prescribed line of conduct. Therefore, the question naturally resolves itself into two points. First, is there anything in the political situation that will justify such action or lack of action? Secondly, to what extent, if any, should a man who may be said to have retired from politics consent to identify himself with a movement having for its object the purposes herein stated? This being the case, it becomes apparent at once that the main question to be considered is one of purely relative importance. You apprehend me, do you not?"—*Chicago Tribune*.

EDITORIALS

Moral Freedom

WE ought to have in America the broadest moral freedom. Our traditions and our institutions are favorable. The colonists who laid the foundations for the Republic were men who sought both religious and political liberty, and were not afraid to fight for the one or the other. The men of the Revolution and of the Constitutional Convention broke down the obstacles which centuries of class privilege had built in the way of men who would rise from humble station to position and success. The men of the Civil War destroyed the legal basis of slavery. We have become a powerful as well as an independent people, and as a politically democratic people it is for ourselves to say what restrictions upon individual conduct we will impose and what we will no longer tolerate. We can be in every meaning of the word as free as we wish to be.

Yet, are we free? The question is not idle. Every now and again it is asked with serious intent, and almost any thoughtful man must hesitate before he answers. Many circumstances have conspired to raise this question anew in recent months. The situation in the theological world is somewhat clearer than it was; but not a week goes by without some new revelation of the constraint which men of broad culture and sincere minds feel in attempting to present the truth as they see it to an American congregation. The developments in commerce and industry have not been cheering to those who regard individual liberty as not only a sacred right, but also an indispensable utility. And what can we say of that wholesale denial of political freedom guaranteed by the Constitution which we are now permitting throughout the southern half of our national domain?

These glaring failures to maintain the freedom which we profess to believe in are not, however, the ones to which most serious attention should be given. They are results of less obvious but far more

dangerous tyrannies. Liberty in the large sense is never lost by a people until a subtler kind of freedom has disappeared. Freedom of speech, freedom within the sphere of private conduct, freedom of social intercourse—these are the mental and moral foundations of economic and political liberty. When a people which has boasted of its liberties begins to realize that the right to work, the right to trade and the right to vote may all be denied with impunity throughout the length and breadth of its territory, the time has come to inquire whether freedom of that more personal and subtle sort which is the very atmosphere of personal independence any longer exists.

Have we, let us ask, any real freedom of speech in America? This startling question is asked by President Benjamin Ide Wheeler in an *Atlantic Monthly* article on "A National Type of Culture." The answer which he gives is one to provoke a serious mood. The law permits freedom almost to the extent of license; but the thousands of organizations which have sprung up to foster "causes" innumerable have created a law outside the law which is becoming more tyrannical than courts or legislatures would in these days dare to be. What trade unionist dares to speak his mind about the preposterous iniquities sometimes associated with sympathetic strikes? What politician dares to say what he thinks of the machine and the boss? What teacher in the public school dares to express his opinion of the text books in history that are forced upon him by patriotic organizations, or the text books in physiology that are forced upon him by "temperance inebriates?" Have we freedom of conduct? Do men and women in America show as much vigorous independence in their domestic arrangements, their social relationships, their friendships, and in their moral example as our kinsmen in England do, where, we are wont to imagine, the reverence for tradition and the fear of Mrs. Grundy are serious barriers to in-

dividual independence? The question is at least a fair one.

The truth, we fear, is that there has grown up in America a moral tyranny of the multitude over the individual which is manifesting itself in many dangerous ways. The mob spirit, culminating in a lynching, is only the extreme manifestation of mass tyranny. The mischief begins whenever an individual, whomsoever he is, hesitates to express his independent judgment on any question of thought, morals or policy, if it happens to differ from the "views" of his neighbors, or hesitates to live his own life in his own way for no better reason than that people will think him radical or queer.

Moral freedom, the spring and fountain head of institutional liberty, has its source in moral courage; and moral courage exists only when men dare in good conscience to question the moral judgments, as well as the business or political judgments, of the majority. This is a fundamental ethical truth which "good" communities are ever in danger of forgetting. It is never in the interest of evil, but always in the interest of a "cause" that men surrender moral freedom. Men lynch to protect life and property. They hold their peace when iniquities are proposed in business or in politics lest an industry or a party be imperiled. They allow falsehoods to be taught in the name of science or of religion lest good women be shocked or the moral order of the community be undermined by doubt. They tolerate insincerities in social relations, and try to bolster up schemes of domestic morality that rest on convenience rather than loyalty and affection for fear "the sanctity of marriage" will be forgotten. The pity of it is that in thus becoming insincere in a good cause men become first cowards and then slaves, and so unable ever to strike a true and free man's blow for liberty.

Surprises in Physiology

THE chapter of physiology relating to the ductless glands continues to develop and new vistas of ever surprising interest are constantly opening up. The results of investigation in this department

of Physiology are attracting the attention not only of the physiological specialist but even the practicing physician finds them of the greatest significance for the science and art of healing. At the recent Triennial Congress of American Physicians and Surgeons, held in Washington during May, Dr. MacCullum, of Johns Hopkins Hospital, Baltimore, whose acute observations on certain blood parasites of animals furnished a missing link in the life history of the malarial organism, presented some very suggestive observations with regard to certain small organs which occur in the necks of animals and man, and that evidently have a significance for even ordinary life processes quite beyond what was ever hitherto supposed. These little structures are the so-called parathyroid glands, usually four in number, somewhat spherical shaped bodies not much larger than peas as a rule, which derive their name from the fact that they lie alongside of the thyroid gland, so close indeed at times that they are partially or even wholly imbedded in its substance.

It may be a matter for very grave surprise to think of medical men considering seriously such minute organs as productive of substances that are actually essential to life processes. Physicians have, however, in recent years got well beyond any *a priori* reasoning that might seem to minimize the importance of the function of small and apparently insignificant organs. The suprarenal glands, it must be remembered—the small, semilunar shaped bodies about as large as the individual's bent little finger, situated just above the kidneys—are now known beyond all doubt to be absolutely essential to healthy living. Not only that, but disease in them almost inevitably brings on a weakness that soon makes the patient bedridden and leads without much delay to a fatal termination. When the English physician, Addison, first described this group of cases the causation of the affection was a mystery. As autopsies on subjects dead from the disease multiplied, it became more and more certain that the only change constantly present in these cases was a pathological condition of the little structures lying imbedded in kidney fat just above the kidneys. It was found

that usually the change in these suprarenal bodies was due to tuberculosis and was therefore practically hopeless of improvement by medical treatment.

Recent observations have shown the reasons for the symptoms of Addison's disease. The suprarenal capsules, as they have sometimes been called, secrete a substance which causes blood vessels to contract. Such contraction, when it affects many blood vessels, causes, as can readily be understood, a rise in blood pressure. The function of the suprarenal secretion then is to maintain blood pressure by keeping up a proper tone in the muscular walls of the arteries. Addison's disease is accompanied by a great fall in blood pressure because of the lack of this secretion in the body. When blood pressure is low the circulation fails, and with this all the vital processes diminish in activity and the health of the patient suffers a corresponding deterioration. Muscles actually become so weak as to refuse to support the individual's weight, and the heart muscle loses force so that the pulse can scarcely be felt.

The constricting effect of the secretion of the suprarenal capsules has been made use of practically in certain pathological conditions. Bleeding from the nose, for instance, can be checked more readily by applications of suprarenal extract than by any other means. Blood vessels are so firmly contracted that the bleeding stops practically at once. The same constricting effect is made use of in the treatment of hyperemia of the conjunctiva. When, because of inflammatory disturbance, the eyes become bloodshot and irritated the use of a dilute solution of suprarenal extract causes the little vessels to contract vigorously and does away with the hyperemia. When secretion from the nasal mucous membrane is too free because of hyperemia of the sensitive tissues of the nose it can be prevented by the application of suprarenal extract, which at once does away with the sense of fulness in the nose and puts an end to superabundant secretion.

With these observations on suprarenal material fresh in mind it is no wonder that the suggestions with regard to the parathyroid glands at once attracts at-

tention. The removal of these glands from animals is followed within a few days by the death of the animal, tho the operation itself is not necessarily fatal nor is it followed by fatal complications because of surgical difficulties. Death takes place after the development of a special set of symptoms, which are very characteristic and occur under no other circumstances. These include muscular tremors that become so extreme as to make standing impossible, very rapid respiration and intermittent attacks, during which the heart beats with extreme rapidity, often more than 200 to the minute. Besides this there is a tendency to the recurrence of apoplectiform seizures and the upper eyelids are retracted in a way that makes the eyeballs seem very prominent. The whole picture presented by the animal from which the parathyroids are removed is not unlike that noted in Graves's disease, an affection described by an English physician, a contemporary of Addison, the principal symptoms of which are tremor, prominence of the eyes, a rapid heart and an enlargement of the thyroid gland in the neck.

Dr. MacCallum has been able to show, the suggestion having previously been made by other investigators in the same line, that if animals from whom the parathyroids are removed be fed upon parathyroids taken from other animals they do not succumb at once, and the symptoms noted are ameliorated to such an extent as to make the animal seem in good health. Dr. MacCallum has found at the autopsies of human subjects who had suffered from Graves's disease that the parathyroid glands were either absent or very much reduced in size. Accordingly parathyroid extract from the glands of animals has been used in the treatment of Graves's disease. So far the results have not been sufficiently definite to make any announcement in the matter possible. It seems not improbable, however, that we are about to have an explanation of Graves's disease such as came for Addison's disease, and that even tho parathyroid extract does not prove curative for this affection it may prove to have therapeutic qualities of great value just as is the case with suprarenal extract.

Trade Union Postulates

CRITICISM of trade union practices sometimes misses the mark through neglect of the underlying theories or postulates of industrial society held by trade unionists. These presumptions seldom appear in the formal prelude to a union's by-laws, and the unionists themselves do not put them forward in scientific shape as the justification of their policies. They are not, in fact, scientifically formulated, but are rather intuitions borne in upon the minds of workmen by the daily knocks of experience. Nevertheless, to demonstrate the unwisdom or injustice of union tactics these postulates should first be proven false, or else the industrial conditions which give rise to them should be reformed.

A conviction of class antagonism is undoubtedly the basis of union theories. By this is meant that the individual, either employer or employee, does not count, but is swallowed in the circumstances of his class, and is therefore not responsible for what he does. Competition forces all employers to come down to the level of the most grasping, and forces all workmen to accept the rate of pay accepted by the most necessitous. A mechanical "grind" eliminates the individual, and consequently eliminates sentiment, gratitude, honor and virtue, as well as vice and hatred, which are the qualities of individuals. This postulate naturally leads to the conclusion that to secure "fair" treatment the workmen must rely not on persuasion, argument or appeals for justice, but on power. Conversely, the employer who relies on gratitude or sentiment in dealing with a union is certain of disappointment. Such qualities have their place in dealing with individuals, whether members of the union or not; but whatever concessions are given to the union as such will be received not in a spirit of gratitude, but as a concession to their power, and will only pave the way for further demands.

Another postulate of unionism is that of limited opportunities for employment—more applicants than jobs. It is significant that unions have come

into existence only since the public lands have been occupied. When the dissatisfied and ambitious workman could go West and take up a claim as a farmer or a miner he would not listen to the organizer and agitator, but when he finds employment in the West as difficult to obtain as in the East he strives to force from the possessors through organization what he formerly secured as an alternative to starting in business for himself. With all the natural opportunities for self employment occupied, a "labor market" has appeared upon which manufacturing industries may thrive, just because the laborers are compelled to seek employers rather than shift for themselves. To criticise union practices on the theory that there is, or should be, work for all is to fly in the face of the most painful postulate of both union and nonunion workmen.

These postulates lead to certain principles which guide the practices of unions. The leading principle is that of *group* advantage. Individuals are left out of account or are forced into line for the advantage of the union group. The principle of the minimum wage throws the less efficient out of employment, but it prevents the employer from using the necessities of these less efficient to depress the wages of the group. The principle of maximum exertion prevents the strongest workman from making the greatest immediate gain from his strength, but it also prevents him from setting the pace for the average strength of the group. Limitation of apprentices gives the group a patent advantage in view of the postulate of limited opportunities for employment, and the sympathetic strike increases the power of the working class in the face of class antagonism.

Since the postulates of unionism have to do with existing conditions the union is essentially opportunist. It has no utopian theories of ideal society, like the socialists, anarchists or "single taxers," where automatic justice shall be meted out, but it strives to get all it can, as soon as possible, with existing weapons, and its own power. Unions become "conservative" and "fair," not

by reason of abstract theories of right and justice, but by reason of organized opposition of employers. The principle of opportunism follows naturally the postulates of class opposition and limited opportunities.

If the postulates of trade unionism are false, then their principles and practices will break down; but, instead of being false, workmen feel that they are increasingly true. Should trade unions abandon their opportunist principles of accepting conditions as they find them they will naturally do so by striving to change the conditions on which their postulates are based. They will go toward the Socialists, who would abolish class antagonism by abolishing the capitalist class, or toward the Anarchists and single taxers, who would open up new opportunities by abolishing private control of monopolized or unused natural and social resources. Given the above postulates, if opportunism fails, radicalism will grow.

Agriculture in the Public Schools

THE proposition of the New York Legislature to allow supervisors to establish County Agricultural Schools is a recognition of the growing importance of agricultural education. A large majority of our population still lives by farming. Many more are, directly or indirectly, dependent on agriculture; while the whole population finds its prosperity gauged by the intelligence which is carried into soil tillage. Behind and beneath all national success and progress is that productive skill which multiplies the products of the field. Agriculture supplies not only our food, but the raw material of manufactures as well as the bulk of the freight carried by commerce. Considerably over half of those exports from which we secure our balance of trade are still agricultural. The Minister of Agriculture of Canada says:

"The total product of our manufactures represents the raw material of our farms, counted in twice or three times; and in some cases four times. The farmer produces \$1,000 worth of wheat, which the miller turns into \$1,200 worth of flour and the baker into \$1,400 worth of bread. The farmer added to the

wealth of the country almost the entire amount. His \$1,000 should be deducted from every bill of shipment of the miller and the baker."

So far as agriculture underlies our whole productive industry it ought to be performed with intelligence. The General Government, recognizing this fact, has created its Agricultural Department. In this it has an Entomological Bureau; but in our schools, and even in most of our colleges, entomology is not taught. The investigation which is carried on by the States does not reach the people through the schools, but through bulletins, that the majority of the people are not educated to appreciate or understand. If the vast amount of investigation and accumulated knowledge on farm economics should percolate through the schools it would double the results of annual production. We have still to meet the astounding fact that \$300,000,000 worth of our annual products are destroyed by insects. Farmers' Institutes and Experiment Stations are splendid substitutes for systematic education, but their very existence emphasizes the need of agriculture in our public schools. We are still left to face the fact that our higher schools are not organized to face the farm, but are crowding their graduates into other walks of life.

The United States is far behind France at the present time in this matter of training for intelligent land tillage. In 1879 a law was enacted in that country making it compulsory for every normal college within six years to provide agricultural training for teachers, and further requiring all primary schools within nine years to make agriculture a part of compulsory studies. One professor of agriculture is placed by the Government in charge of each of the 86 school departments of France. These professors give instruction in normal schools, they hold Farmers' Institutes, and are themselves occupied directly with investigation. Every normal school in France has attached to it a large garden plot or farm for applying acquired knowledge. This is for the purpose of placing teachers in all schools prepared to work intelligently outside of books.

For the lower schools object lessons in drawing are prescribed; the next grade passes on to school garden work;

while the middle schools continue the same work, adding to it the higher practice of husbandry. Higher schools have methodical instruction in draining, manures, sowing, harvesting, farm accounts, grafting and trimming. Agricultural museums are built up in connection with the schools. It is the effect of this sort of training on French life that has made the recuperative power of the republic so remarkable. While the decadence of the population in the larger cities is marked, the French peasantry is moving to the front of European populations. The land is not only cleaner than that of England, but it is far better cultivated. A recent English writer says that in his own country

"The owners of estates above one acre are 300,000, while in France they are 7,000,000. In England the average extent of a single farm is 390 acres; in France it is ten acres. There are 4,000,000 holders of property of two acres in France, while the farms of 200 acres can be counted on your fingers."

There are 8,000,000 acres of common land in France, which is exactly the number of acres England has allowed to be taken from laborers to make private parks for the wealthy. We might expect to find that in England the rural population is about one-third of the whole, while in France it is considerably more than two-thirds. In England the peasantry is miserably housed and servile in manners, while in France the rural population is independent, well-to-do and cheerful.

It must be understood, or ought to be understood by those who discuss this question, that when we advocate the teaching of agriculture we are doing little more than urging instruction in modern science. Agriculture is an application of nearly all the sciences, rather than a science by itself. In the garden schools of Germany and England the application of acquired knowledge is constantly made in the garden. It is difficult to name a science that does not directly appertain to horticulture, gardening and farming—botany, entomology, geology, chemistry, ornithology wait only for application to constitute agriculture. So, then, it is not plowing, butter making, grafting, soil analysis, cross-breeding of plants and animals, that we are directly

to study, but we are to apply botany, entomology and chemistry and other sciences in the direction of such achievement. All this while our common schools will be creating a public sentiment in favor of country life, arousing an ambition to be come helpful producers of wealth, and imparting correct views of farming as a profession. Certainly that education is wrong which takes a farm boy and points him away from the farm toward a profession or toward some other industry—that leaves him with the conception that the most productive of the industries is the least honorable. President Eliot insists that the first constituent in a right education is training the organs of sense, by which we get at the external world—the whole inanimate and animate creation.

With these definitions we are prepared to urge an increased and systematic study of agriculture in our schools—that is, the study of those sciences that underlie successful farming, applied in any way by the schools in the daily process of education. The garden school is the ideal school, and the application of acquired knowledge, together with habits of investigation, constitute real education. When this is brought about our youth will hold agriculture in its true light as one of the noblest, broadest, most inspiring and satisfying of the professions and industries. Our normal schools should be modeled after those of France; so that the teachers may come to us fully prepared for something besides the study of books, and with a deep sympathy for those pupils who are using their acquired knowledge in the way of applied and scientific effort.

The Mine Explosion at Hanna

WHENEVER we are shocked by the news of some sudden calamity like the mine explosion of Hanna, Wyoming, we instinctively protest. Need such things be? In the past when men felt themselves less responsible for the world than they do to-day such a disaster would be simply called the "act of God." Nowadays we try to fix the responsibility for everything, except possibly cyclones, on some individual, and we ask each other, without getting any satisfactory answer,

was it the fault of a careless miner, a mercenary corporation, or an incompetent ventilation inspector? Are the laws too lax, or is science inadequate? It disturbs, or it ought to disturb, the peace of mind of all of us, if we feel that such an essential of our daily life is produced at any unnecessary risk or sacrifice of life. It is not right to find fault when we do not know with whom to find fault. On the other hand, we should not dismiss the event from our minds with the hasty reading we give to other paragraphs in the daily press, but should try to realize who these people are who are working for us at a risk to life, which perhaps could be made less than it is.

The accident, whether unavoidable or not, is easy to understand. There was the hissing of the deadly fire damp as it crept through a crevice on its victims; the flash of a miner's smoky torch and then the wind of fire swept through galleries like a cyclone, twisting out the heavy timbers, tearing in pieces the cars and sending to instant death 236 miners, among them the fire-boss, who had reported "all's well" after his rounds in the evening before. Mattresses, medicines and doctors hurriedly sent in from Laramie on the East and Rock Springs on the West were not needed. Only coffins were of use, and but few of them. To the widows and orphans who remained all night about the pit's mouth, lamenting in languages native to the Arctic Ocean, the Danube and the Mediterranean, there came from the lower levels no semblance of those they had lost.

Hanna, which was named after the Senator from Ohio, is a Union Pacific town. The land and the houses are all owned by the railroad, and are rented, never sold. This is rather an advantage, for the mines of Southern Wyoming are only worked to a certain depth, and then shafts opened a mile or twenty miles away. The neighboring town of Carbon was, like Hanna, a flourishing mining town only a little more than a year ago, but straightening a curve in the railroad left it deserted and without any reason for existence. Some houses were torn down and moved, some were sold for five dollars, some were left because they could be neither sold nor given away. It is easy to see, then, why it is consid-

ered better to rent than to own land and houses in the mining towns, for if Hanna should be deserted, as it may be now if the mines continue to burn, as is possible, for several years, it would be a simple matter to load the little red houses on the cars and move them to a new place. The company store provides all articles of necessity and some of luxury and at not unreasonable prices; the company doctor tends to their wounds, and altogether it is a model seigniorship of our benevolent feudalism.

The people in the Wyoming coal mines are mostly men without a country; some of them Poles, more of them Finns. The Finns are hard working and honest, and their children in the public schools outstrip the other nationalities, including native American. The most prominent building in the town is the Hall of the Finnish Temperance Society. It must not be thought that temperance here means total abstinence, as it usually does with us. In fact, what to a Finn is temperance would in some cases seem to other people immoderation; but the hall serves as a center of the social and religious life of the community and keeps alive something of the national spirit. The miners are well paid, and those who are sober and industrious accumulate some money. In a dull season many go back to the old country, as it is cheaper to go to Europe for a few months of the year than to live in the West while they are out of work.

Not many months ago a singular mail arrived in Hanna. Usually, of course, the foreign mail brings its ordinary mixture of good and bad news, and the recipients are glad at least to hear from home; but this mail saddened every Finnish heart before it was opened, and strong, rough men broke into tears at the sight of the envelopes. The postmaster could not understand how they knew that the letters contained bad news before they read them, but the Finns pointed to the stamp. It was the Russian stamp and they knew their country was no more. It was the death of the fatherland.

Negroes form a large proportion of the miners, and they too might be regarded as men without a country, since in the whole world there is none to pro-

test against their abuse, as the Chinese protested against the massacre at Rock Springs, or as we have protested against the riots at Kishineff. There was considerable opposition to them when they began to be brought into the country in such large numbers. It was said that they were an undesirable class, many of them brutal, some criminal. Doubtless there was some truth in this, but we cannot deal so at wholesale with the race. One at least of these negroes is a Christian and a hero. His name is William Christian, and when the death-blast came he might easily have saved himself, but he went back a dozen times into the fire and suffocating gases to drag out men who were insensible, until finally he too fell and was rescued with difficulty. The next day he took his place again in the front ranks of the excavating party.

To increase our common consciousness, to be able to sympathize, which is, after all, merely to feel together, is the mission of the press. We should be able to recognize heroism in the humblest and to demand for these miners the same protection to life which we would ask for if we were working underground at Hanna.

The New Pacific Cable

It was fitting that on Independence Day our Government and people should cease to be dependent upon European cable companies for quick communication with the Philippine Islands. With our new possessions in the Pacific, Hawaii as well as the Philippines, we are now placed in touch by an American company, and are freed from the exactions which have been a not inconsiderable addition to the War Department's expenses. The Commercial Company has done promptly and well the work that enables us not only, for the transmission of messages, to annihilate the distance between Washington and Manila, but also, as the President's experiment showed, to girdle the earth in nine and one-half minutes. Much credit is due to the company, and it should not be withheld; but we regret that Congress did not improve an inviting opportunity to connect these islands with our mainland by a Government cable, and that Mr. Roosevelt's message to Governor

Taft was not transmitted from San Francisco over wires laid, owned and operated by the United States.

Bribers and the Bribed We publish in this number an interesting and suggestive article from the Rev. Dr. John P. Peters, rector of St. Michael's Church in this city, as to the responsibility of Directors for corrupt work done for the benefit of their corporations, and the duty of the press to point out to the public this responsibility by naming the Directors who deserve to be held accountable for wrongs committed or attempted by agents of their companies. As Dr. Peters says, we did publish the names of certain responsible Directors at the time of the tunnel disaster. We shall take the same course hereafter, whenever the circumstances call for it and such action is warranted in a weekly magazine of national rather than local circulation. Obviously, however, it is the local daily papers that should take this course with respect to corruption and fraud which affect directly the communities whose interests they serve. As a rule, a large majority of the daily papers in New York have not shown any lack of courage and independence in their treatment of legislation or projects designed corruptly to defraud or otherwise to wrong the people who read them or the city in which they are published. It may be that in some of the papers to which Dr. Peters's forcible protest was sent the names accompanying it were omitted deliberately by direction of the editor in charge; we presume, however, that in some cases the list of names was hastily and thoughtlessly cut off by a copy-reader, whose chief aim was to save space. It is frequently the duty of daily papers to publish, without helpful suggestion, the names of Directors who are officially responsible for glaring offenses, in order that they may be subjected to the force of public opinion. Whenever, upon request of a prominent citizen or a worthy organization, a paper refuses to do this, a corrective may be applied by publishing the fact of that refusal, with appropriate comment, in other journals that are willing to make the names known.

The Trundling of Relics

It is to be hoped that the protests in many daily papers will call a halt to the trundling of the Liberty Bell about the country as a spectacle for gaping crowds. Something has been said about treating Plymouth Rock to the same unworthy jaunting trip, but this sacrilege, we believe, has not been contemplated seriously. Yet no one can say just where this mania will end for carting about sacred relics. Grant's cabin is to be carried from Carondelet to the World's Fair in St. Louis and planted there as one might set up some attraction in a dime museum. A German critic once remarked that the two most striking characteristics of the American people were their good humor and their lack of reverence. Certainly this absurd mania lends some credit to the least agreeable of our German friend's observations. The only real benefit from preserving relics of famous men and events is that those who behold them may learn reverence for what is noble or pathetic. To treat such relics as the Liberty Bell has been treated, or Libby prison, or Grant's cabin, is to make them an object of vulgar curiosity and not of reverence. One would suppose that the humor of the American people would save them from this particular form of irreverence, but it does not seem to do so.

Compromise in Iowa

Governor Cummins may find as he says he does, in the compromise tariff platform adopted at Des Moines a warrant for what he has said during the last two years and intends to repeat hereafter; but it is true, nevertheless, that the essential idea of his old platform has been withheld from this new one. In the old platform the dependence of some great Trust corporations or combinations upon tariff duties for the maintenance of high prices in the home market was asserted or forcibly suggested. The platform adopted last week has nothing to say about any relation existing between the prices or exactions of Trusts and the duties upon foreign products like their own. "Tariff rates," it says, "should be just, and equally opposed to foreign control and domestic monopoly." That is the only assertion which the Governor can

use as an official text for an argument demanding a reduction or the removal of certain duties because monopolistic corporations use them as instruments for the exaction of high prices from consumers. To his mind it can scarcely be adequate for that purpose. In the paragraph relating to Trust corporations there is no suggestion of even the most remote relation between them and the tariff. They should be so regulated and controlled, the platform says, as "to prevent monopoly and promote competition," but how or by what regulations this end may be accomplished it does not explain. "Duties that are too low should be increased, and duties that are too high should be reduced." When? Those who practically excluded "the Iowa idea" from the platform would postpone the date of such a revision until the Greek Kalends. "Both sides must give and take," says the paragraph in praise of reciprocity. This is not the doctrine of those who have buried in the Senate a dozen reciprocal treaties. They would take much, but give little or nothing. On the whole, the platform marks a victory for the "standpatters," as they call themselves, altho the Governor, nominated by acclamation, is their foremost opponent and is said to have the support on this point of a majority of the Republicans in Iowa. If he really has this support, the platform will not silence him.

The Power of Eddyfication

We doubt if Christian Scientists themselves are aware of the full significance of certain statistics brought forward at a recent meeting of the Mother Church in Mechanics' Hall, Boston. According to the Boston papers, whose veracity is unimpeachable, there were some eight thousand persons present at this solemn occasion, which is decidedly better than most denominations could do. But the number of the attendants is nothing in comparison with certain other figures which must have sent a thrill of complacency to the devout hearts there beating. It appears that the death rate of the faithful this year is 2.24 per 1,000 against 18.73 per 1,000 in the whole wicked city of Boston. A little calculation will show, therefore, that your chance of dying in that town, if you are

one of the faithful, is eight times less than if you belong to the un-Eddyfied. That is decidedly worth paying for. No wonder that at the close of the meeting the audience joined heartily (or do we dream it?) in singing that ancient hymn from the Veda (the most ancient utterance of the Faith) in which immunity from all disease and death is implored. But the greatest wonder is yet to be told. Last year the death-rate among the Believers was 2.32 per 1,000, whereas it has been this year only 2.24, which, it will readily be seen, is a decrease of .08 per 1,000 in a twelvemonth. Now there is no reason to suppose that Christian Science has reached its culmination or that the power of faith has been thoroughly tested. On the contrary, every Christian Scientist will avow that the healing effluence of his Church has only begun. Suppose, then, the decrease in mortality does no more than continue at the present rate, which is a small claim. In other words, divide 2.24 by .08, and what is the result? Just this: *In twenty-eight years Christian Scientists will have attained the goal of deathlessness!* There is no doubt of it; the figures lie before us. The conjectures which arise in our mind at this thought are as bewildering as they are awful. Will the faithful grow in beauty and grace, in youthfulness, so to speak, as they grow old; or will they pass into a state like the famous Struldbrugs in the land of Luggnagg? The ungodly might hint that the *auri sacra fames* so notable in the practitioners of the drugless art of healing would ally them to the immortals whose greed Swift has so vividly described. Others, again, will quote the couplet of "Don Juan" which begins with "that good old-gentlemanly vice" and ends with the proper rime "avarice." But such conjectures are, perhaps, premature. We shall see in due time the true power of Eddyfication.

Southern Educational Needs

What the South needs in education, first, second and third, is teachers, teachers, teachers. For white schools or blacks there is the same sad lack of competent teachers. The Peabody Fund is preparing to put a large part of its money

into a normal school at Nashville. The management of the Slater Fund, under Dr. Haygood, understood this, and gave its income largely for normal instruction; altho under the direction of Dr. Curry it changed its policy, so as to support the creation of carpenters and blacksmiths rather than of teachers. You cannot make a good teacher by having a man work all day in a shop and study in the evening. The South is not yet rich enough to provide teachers of manual training for its common schools, nor, indeed, is the North. What is first needed is good teachers for the common English branches, to teach in the high schools, the grammar schools, the primary schools, and the too often ungraded district schools. It is the schools that will provide these well trained teachers with which our missionary societies, with their nearly a million a year, the Southern Education Board, with its \$100,000 a year, the Peabody Fund, with its \$80,000 a year and the Slater, with its \$45,000 a year, ought principally to concern themselves. And let it be remembered that the best education they can get is none too good for teachers, North or South, and that there is a deplorable lack of them in the South.

In view of Dr. Morrison's striking account of conditions in the Congo Land it is only fair to say that many Belgians in positions of authority claim that the government of the State is on the whole the best possible under the circumstances. A prominent Belgian writes us as follows:

"I with other Belgians here in New York, who have known many officers and agents of the Congo Free State, feel indignant at the accusations brought against them in such an indiscriminate way. That there have been here and there scoundrels, may be true, but they are punished for their misdeeds; and all impartial authorities agree that the best is being done by the State under the trying circumstances."

We publish this statement out of deference to our correspondent, not meaning to discredit the trustworthiness of Dr. Morrison's report. The testimony in support of the Belgian government has been gathered into a volume entitled "The Truth About the Civilization in Congoland."

INSURANCE

Marine Insurance

MARINE Insurance has great antiquity. It was doubtless instituted soon after the earliest ocean trading began. So soon as merchants commenced to send merchandise across the sea in ships, the men who thus ventured more or less of their fortunes must have sought to protect themselves from the perils and dangers of the deep by means of Marine Insurance.

In considering Marine Insurance it will quickly be found that the subject is exceedingly complex. Age has by no means robbed it of mystery. Amid changing methods and new discoveries it has continued to linger in many ways much the same as it was when the system of Marine Insurance was originally instituted.

The system of Marine Insurance when the Roman Imperial Eagles dominated the seas, and as it is to-day under various governments, bound together by international law, must be essentially the same. So much of premium paid by the insured, on condition that the insurer shall make good any loss according to a scale agreed upon, such loss to be determined by some disinterested but authoritative outsider.

One thing that has served to make Marine Insurance a fertile field for fraud and other crimes is the extreme difficulty of proving any alleged wrong. A vessel leaves port with everything seemingly in her favor. After a time her captain and crew return as shipwrecked mariners upon another ship and report shipwreck with a total loss of vessel and cargo. How is it possible to gather evidence showing proof of fraud upon which to contest the payment of a claim for loss? The dangers of the seas are many and legitimate losses often come about in the most unexpected ways. That the perils and dangers of the sea are multiplied by unscrupulous men no one can doubt. It is with such things, as well as with ordinary accidents, that Marine Insurance has to do.

Out of an elaborate Marine Insurance fraud Charles Reade, in "Foul Play," has written a most fascinating story. A shipmaster who sends a bad or an unseaworthy, but heavily insured ship to sea, not only commits fraud and endangers the lives of the sailors on board, but he is guilty of wholesale murder, just as surely as if he had lifted his personal hand against the individual members of the crew.

The remedy is hard to find. If an insurance company could refuse to make good losses due to the negligence or bad faith of the ship owner, or his agent, Marine Insurance would be reduced to comparative simplicity. This is by no means easy to accomplish. It is, however, quite possible in practice for Marine Insurance companies as well as others to insist upon certain changes in a ship's equipment and otherwise that will minimize the risk. Insuring companies may require radical changes as a condition preliminary to writing a policy. All such precautions are beneficent and cannot help but exercise an influence for good against those who are inclined toward fraud.

THE General Assembly of Connecticut at its last session amended the charter of the Hartford Life Insurance Company so as to permit it to write Health Insurance. This amendment was accepted and approved by the stockholders of the company at a meeting held May 12th, 1903.

....At a meeting of the Directors of the United States Life Insurance Company, of this city, held at the home office on June 9th, Mr. William H. Porter, President of the Chemical National Bank of New York, was unanimously elected Vice-President of the Company and a member of its Finance Committee. Mr. Porter succeeds the late George G. Williams, with whom he was associated, in both the offices now held by him. John P. Munn, M.D., is the President of the United States Life Insurance Company.

FINANCIAL

Finances of the Year

THE Treasury Department's figures for the fiscal year show that the excess of receipts over expenditures was \$52,710,936, which may be compared with \$92,000,000 in 1902 and \$77,000,000 in 1901. Income was \$558,887,526, and outgo \$506,176,590. Owing to the repeal of war taxes, the internal revenue receipts were reduced by nearly \$42,000,000, but the receipts from customs show a gain of about \$29,500,000. This is due chiefly to enlarged imports of materials to be used by manufacturers, and of some finished products which could not be obtained from our own factories without much delay. It indicates activity rather than idleness in our own industries. While the total revenue was less than that of 1902 by \$3,500,000, there was an addition of \$35,000,000 to the expenditures. Of this increase, \$15,000,000 is to be charged to the navy and \$6,000,000 to the army. The Treasury's available cash balance at the end of the year was \$231,415,000 and the total amount of gold in the Treasury was \$631,639,000, an increase of \$71,000,000 in twelve months. At the end of the year the national bank circulation had risen to \$413,670,650, the addition for the year amounting to \$56,000,000, or nearly 16 per cent. The Treasury's figures do not include the revenue (\$134,268,000) and the expenditures (\$138,885,000) of the Post Office Department. Here a deficit of \$4,617,000 is disclosed, against \$2,961,000 last year.

The Steamship Trust

THE combination of Atlantic steamship lines made by Mr. Morgan is the subject of some discussion here and abroad, owing to the very low prices to which the company's shares have fallen. These shares have not been listed at the New York Stock Exchange, but for a long time past they have been bought and sold in small quantities on what is called the "curb" market, where the quotations last week were \$6 for the common stock and \$25 for the preferred. As sales were made at these figures, the pub-

lic at present appears to regard the stock of the International Mercantile Marine Company with misgivings. Conditions have not been favorable since the combination was made. There has been an over supply of Atlantic tonnage, owing to the release of freighters at the end of the Boer War. Bankers in Baltimore who are interested in the project point out, however, that the company has issued only \$45,000,000 in bonds, and that its fixed charges are only \$3,150,000, while fixed charges and dividends of the several companies prior to the merger were \$3,300,000. The British Government announced last week that it would discontinue the payment of war subsidies for merchant ships one year from April next; but the company will lose not more than \$50,000 a year by this, on three ships of the White Star Line, and the payments will be made for almost two years to come. The withdrawal of the Cunard Company from the Atlantic agreement as to steorage rates probably indicates an increase of competition in the passenger business. The investing public has not suffered by reason of the low prices of the stock, because the shares have not been on the regular market and the public has not been asked to "digest" them. The weight of the decline has fallen upon the shareholders of such companies as the Atlantic Transport, which was sold to the combination for stock and not for cash. With improved conditions in the freight trade, the value of the shares would rise. The project was an ambitious one, in which the whole world exhibited interest. Thus far, it has not been successful.

THE statement of the Merchants' Trust Company at the close of business, June 30th, shows surplus and undivided profits of \$1,442,976 and total resources of \$6,499,398. This company, of which Edwin Langdon is president and John B. Grant secretary and treasurer, has a capital of \$500,000.

....Dividends announced:

Survey of the World

Nine Rioters Killed at Evansville

It was thought that peace had been restored at Evansville, Ind., on the 5th inst.; but rioting was resumed on the afternoon of the 6th, and a collision between the mob and the militia guarding the jail took place at a late hour that night. Five rioters and one young girl were instantly killed, thirty persons in the mob were wounded—at least four of them fatally—and of four soldiers who received injuries one is in a dangerous condition. On the 3d, Patrolman Massey had been killed by a negro named Lee Brown, whom he was trying to arrest for a murderous assault upon another negro. Brown was locked up in the jail, but owing to the attacks of the mob he was taken secretly to Vincennes, and afterward to the penitentiary at Jeffersonville. The rioters would not believe that he had been removed, until they had forced their way into the jail and obtained proof that he was not there. Then they attacked the negro settlement, wrecking houses and driving the inmates to the suburbs. Arms and ammunition had been procured by breaking into stores in the city. On the afternoon of the 6th, the mob once more attacked the jail, which was defended by the local company of militia and 200 deputies. Before night two of the rioters had been bayoneted by soldiers acting in self-defense. At midnight the mob, 2,000 strong, pressed forward, firing upon the guards and at the same time throwing bricks and stones. No order to return the fire was given by the commander of the militia, but the soldiers—one of whom had been shot—fired a volley in self-de-

fense. The mob dispersed, leaving on the pavement thirty persons dead or wounded. Five men had been killed, and with them Hazel Allman, a young girl who was sitting with her father and mother in a carriage 200 yards from the jail. Of the wounded rioters four have since died, and a sergeant of the militia may not recover from his injuries. There were in the jail sixteen negroes, confined for various offenses. The mob had sought to get possession of these. Before morning the soldiers were reinforced by a company from Vincennes, and six more companies were sent to Evansville on the following day. There had been 8,000 negroes in the city; many of them fled across the river to Kentucky; those who went to neighboring towns in Indiana were warned away when they sought admission. On the 7th, Evansville was placed under the control of Brig.-Gen. McKee and a Committee of Safety. This was the result of a conference of citizens, at which, the published reports say, the president of the Central Labor Union demanded that the militia be at once withdrawn because they "menaced the peace of the community." Twenty rioters were speedily indicted, and as many negroes were fined \$100 each for carrying concealed weapons. Governor Durbin declared that while he was greatly shocked by what had taken place, the militia and the deputies had simply done their duty. "They shall be upheld," he added, "and this rioting shall cease if it takes every soldier in the State to suppress it." On the 8th, Judge Rasch sent the sheriff to Jeffersonville with orders to bring Brown at once to

Evansville for trial. Governor Durbin at once countermanded these orders in a long dispatch to the Judge. Pointing out that Brown was suffering from severe and possibly fatal wounds, he said:

"However heinous the crime or seemingly clear the guilt, he is entitled under the most sacred tenets of our jurisprudence to a hearing, which he cannot have in the very nature of things until he is sufficiently recovered to make a defense, if he has one. No grounds should be given for the suspicion that even a guilty man has been railroaded to the gallows to satisfy public sentiment, or that the civil authorities have been influenced to the determination of their course by the demonstrations of the lawless. I do not desire to compromise for a moment with the mob spirit. Let this man be tried as speedily as his condition will permit, under the safeguards prescribed by our laws. If at any stage of the procedure it shall appear that there are those in your city who desire to deprive it of its efforts to exercise the function conferred by the people, then the State will be ready to give further demonstration of its disposition and its ability to do with rioters as they deserve."

On the 10th inst., five companies of militia were withdrawn from the city.—Several attempts to lynch negroes were reported during last week, but only one was successful. This was near Vicksburg, and the negro had killed a white man. At Barnwell, S. C., a mob that tried to take a white man from jail in the absence of the sheriff was repelled by his daughter, Miss Mary Creech, 18 years old, who defended the prisoner with a rifle.

Washington Topics No new discoveries were reported last week by those engaged in the postal service investigation. Postmaster General Payne continues to be in poor health, and for this reason, it is said, he would like to give up his office. But it is expected that he will remain at the head of the Department until after the assembling of Congress. Third Assistant Madden has written a letter in which he virtually apologizes for a former letter that was regarded as containing some reflections upon the course of First Assistant Wynne and Fourth Assistant Bristow.—The War Department has begun its investiga-

tion concerning the Lyon glove contracts and the connection of Representative Littauer with them.—It was asserted, last week, that altho the architect's plans for a new public building in Cleveland (for which \$3,000,000 has been appropriated) called for granite, Senators Hanna and Foraker were striving to procure the use of Ohio sandstone, in spite of the fact that the lowest bid for sandstone was higher by \$308,000 than the granite bid; also that Congressman Biedler, president of a sandstone company which would probably supply the material, was exerting his influence in the same direction. It now appears, however, that the sandstone bid was lower (instead of higher) by \$308,000, and that, if sandstone should be selected, the stone would in all probability be supplied by a company much larger than Congressman Biedler's, and of which his company is an active rival. The stone-cutters of Ohio have petitioned for the use of Ohio stone, and their representatives in Congress have joined in their plea for such a recognition of a State industry. In Indiana and other States local building stone of approved quality has been substituted for granite in public buildings, the original plans of which called for the latter material.—William Allen White, of Kansas, publishes in his paper a story to the effect that the President sharply resents an attempt by Senator Burton to make a public use of his name in support of the company organized to construct at the St. Louis Exposition a reproduction, on a small scale, of the city of Jerusalem. According to this story, the Senator called upon Mr. Roosevelt and described the project, saying that it would interest religious people and promote the study of the Bible. Mr. White asserts that the President gave to the Senator a private letter, addressed to some friends, commending the project; that the Senator placed a copy of the letter in the center of an advertisement designed to sell the company's stock, and sent the advertisement to a magazine; that the editor of the magazine, before publishing the advertisement, wrote to the President about it, and that on account of his indiscreet act

the Senator has ceased to exert any influence at the White House. The corner stone of the reproduction of Jerusalem was laid in St. Louis on the 11th in the presence of 50 natives of Palestine and a large assembly. One of the addresses was made by Senator Burton.

The Panama Canal Treaty News from Bogota concerning the pending canal treaty indicates that action may not be taken before the beginning of the regular session of Congress, on the 20th. Thereafter it will not be the only subject of legislation and the delay may be prolonged. The opposition appears to be led by Ex-President Caro, who has demanded that President Marroquin shall sign the treaty before the vote is taken. Ratification is opposed mainly on the ground that it involves a concession of Colombian sovereignty over the canal strip; but Señor Pedro Velez, a member of the Colombian House and a nephew of the President of the Senate, said in New York last week that the Colombian people not only oppose this concession, but hold that the sum to be paid is not large enough. Final action, he thinks, will not be taken before September 1st. The American counsel for the French company, whose views are said to be regarded with much favor at Washington, holds that Colombia is morally bound to accept the treaty because she initiated the negotiations for the purchase of the company's rights by the United States, and consented both that the company should sell and that the United States should buy. Our Government is not disposed to take official notice of the recent remarkable utterances of the Colombian Consul-General at London. This officer asserted that the signing of the treaty at Washington was the result of American intrigue and pressure, and that agents of our Government have for months been inculcating a spirit of revolt against Colombian control in the minds of the people of Panama. If General Reyes, he says, prevents ratification (and he adds that Reyes has arms and men enough to proclaim a revolution and unseat President Marroquin), "Panama will rise and claim its independence with

American guns and ammunition purchased with American money."

"Once again America will step in and assert the independence of a down-trodden people, as she has done in the past to her own increased and lasting benefit. Then the American Government will build the canal, enforcing its own terms."

This possible result of a disagreement has also been suggested in a letter addressed to President Marroquin by M. Bunau-Varilla, of the French company, who says that failure to ratify the treaty would "open only two ways:"

"Either construction of the Nicaragua Canal and the absolute loss for Colombia of the incalculable advantages resulting from the construction on her territory of the great artery of universal commerce; or, the construction of the Panama Canal after the secession and the declaration of the independence of the isthmus of Panama under protection of the United States."

Opium in the Philippines

Owing to opposition manifested both in this country and at Manila, the Philippine Commission's Opium Concession bill appears to have been defeated. It had passed its second reading. As we have explained heretofore, it provided that the right to sell opium in the islands should be awarded for a term of years to the highest bidder, who must be a Chinaman and who would be forbidden to sell the drug to Americans or Filipinos or to any persons except Chinamen not less than 25 years old, who can prove that they have for a long time been habitual users of it. In Washington, last week, Secretary Root heard the objections of Bishop Thoburn, of the Methodist Church, and the Rev. Wilbur F. Crafts, of the International Reform Bureau, who not only oppose the bill but ask that the importation of opium into the islands be prohibited. The Secretary said he had already informed Governor Taft by cable that he preferred a law which would prevent importation except for medicinal purposes. At Manila, on the 8th and 9th, there were hearings before the Commission. The Chinese Chamber of Commerce and the Evangelical Union opposed the bill, the latter urging that the sale of opium should be prohibited. The Chinese

Chamber of Commerce, however, appears to prefer existing conditions, which permit large and indiscriminate sales of the drug, a great part of the supply having been smuggled into the islands. The Chamber's protest had been signed by merchants who are the chief importers and distributors of opium. Commissioner Smith asserted that they had tampered with the local press in their attempts to defeat the bill, and had raised a fund to be used in the work. Representatives of the contractors who have opium monopolies at Hong Kong and Singapore argued in support of the bill, saying that the use of opium had spread rapidly among the Filipinos since the expiration of the monopoly granted by the Spanish Government. It was probably due to Secretary Root's cablegram that the Commission introduced a substitute bill, which forbids the sale or use of opium except upon a physician's certificate, and permits it to be kept for sale only by pharmacists. The original bill provided that the proceeds of the monopoly should be used for educational purposes.

Controversies Over Labor Questions

Fourteen unions in the building industry at New York have accepted the arbitration plan proposed by the associated employers, and it is expected that the remaining unions will take similar action, altho the plan has been formally rejected by the Board of Building Trades, in which nearly all of the unions are represented. This Board, however, appears to be controlled by the unions' walking delegates, whose power the associated employers have sought to take away by providing for arbitration. The union of which Samuel J. Parks (recently arrested on several charges of blackmail and extortion) is the chief walking delegate has rejected the plan, appropriated \$5,000 for his defense, and directed its president, Robert E. Neidig, to resign his office in the Civic Federation. When the District Attorney sought to obtain for the grand jury the books of this union, in order to ascertain whether the money paid to Parks had really been distributed in the union, the answer given was that they had been

lost. The employers' arbitration plan binds them to employ union men only, if a sufficient number of them can be supplied; if it be necessary to employ non-union men, these, if competent, must join the union. The controversy which is now to be settled by this agreement has caused a suspension of work for nearly three months on buildings representing an investment of \$90,000,000; about 125,000 men have been idle, and the loss of wages is said to have been \$35,000,000.—That the street railway strike in Waterbury, Conn., which began several months ago and was marked by great disorder, is still in progress is shown by a recent vote of the strikers' union that it would not accept a proposition said to have been made by the company. But the company denies that it has made one.—The similar strike in Richmond has not been ended. Militia are still on duty there and in the adjoining town of Manchester, where an iron worker named Taylor was killed last week by the soldiers while he was attempting to escape from custody, having been arrested for riotous conduct. The local bricklayers' union ordered a boycott upon a company that supplies builders' materials because the head of this company was also president of the street railway company. He has sued the union for \$10,000.—Some of the strikers at Philadelphia have accepted a compromise offered by the carpet factories. "Mother" Jones, a labor agitator well known in the coal districts, is marching from Philadelphia to New York at the head of a company of the strikers and their children, who were also employees, her purpose being to "show the millionaires" the iniquity of child labor.—Two striking teamsters have been convicted of conspiracy at a jury trial in New Haven, their offense having been assault upon non-union drivers. Other similar cases are pending there.—At a funeral in Grand Rapids last week the proceedings were interrupted when the procession was about to start from the church for the cemetery by an assault of union drivers upon the drivers employed, who had come from a non-union livery stable. Those in charge of the ceremonies found it necessary to dismiss the non-union men and employ union drivers in their places.

The Pope Each day during the past week the Pope was reported to be dying, but with astonishing vitality he has survived two serious operations and has been able to attend to important affairs and receive some of the Cardinals. He has risen and dressed almost every day, saying that he would not die in bed but at work, and he has even indulged in his favorite recreation of reading and composing Latin poetry. On July 10th the doctors punctured the pleura with a needle, after having deadened the parts with cocaine, and drew from the lungs 800 grams of serum. Two days later a second accumulation of liquid was removed in the same way, both operations giving immediate relief. Injections of digitalis were given at intervals to strengthen the heart, and of camphor-caffeine to overcome depression. Oxygen was inhaled or allowed to permeate the apartment. The Pope took great interest in the numerous telegrams and letters of sympathy received at the Vatican, and his attendants could not keep him from reading the doctors' bulletins and the papers. On hearing that a delegation of peasants from the little town of Carpineto, his birthplace, had arrived, he was with difficulty persuaded from receiving them in person. When he was told that King Victor Emmanuel had postponed his visit to Paris on his account he exclaimed, "Ah, we know how chivalrous is the House of Savoy, even to its opponents." In response to a telegram from the United States, he said: "The Americans have always showed me more affection than any other people. I love them." The sudden death of Monsignor Volpini, who had been appointed Secretary of the Consistorial Congregation only five days before and who would have had charge of the arrangements for the conclave, has caused great confusion because in the event of the Pope's death his Secretary of State, Cardinal Rampolla, goes out of office, and it is uncertain who will be in authority during the interregnum. Cardinal Oreglia, Dean of the college, is the only one of the Cardinals who was not appointed by Leo. Cardinal Gibbons has already departed for Rome to attend the conclave, which must be held within ten days after the Pope's death. Our American Cardinal McCloskey at the

time of the last papal election did not get to Rome in time to vote in the election of Leo XIII. *Italia*, the Roman newspaper, says that Cardinal Gibbons will represent a moral force of the first rank. He is the only Cardinal absolutely free and independent of all the petty intrigues and machinations which to some extent precede a conclave. Cardinal Gibbons has been suggested as a possible candidate for the papal throne, but his election would be an impossibility, if for no other reason, on account of the veto power of Spain, which with half the number of Catholics there are in the United States has four times the representation in the conclave.

The American Squadron in England

The "Kearsarge," "San Francisco" and "Chicago," constituting the American squadron in European waters, reached Spithead on July 6th. The news of the arrival of the American fleet was promptly communicated to Admiral Hotham, and the vessels of his Channel squadron twinkled a welcome with their electric lights. The gunboat "Machias" was not with her sister ships when they reached Spithead, but joined them the day following. The American squadron was welcomed at Portsmouth, Great Britain's naval headquarters, on July 7th with booming cannon. During the day Lord Beresford, Vice-Admiral of the British Navy, and the Mayor of Portsmouth exchanged courtesies and speeches of gratification with Rear-Admiral Cotton, of the visiting squadron, and showed him many honors. The King sent a message of welcome from Buckingham Palace. The British and American commanders later exchanged calls on the flagships, according the usual honors as each came over the side. In the evening both the English and American ships were illuminated. On July 8th fifteen hundred American officers and men were entertained at Portsmouth at luncheons and in various other ways. In formally welcoming the American naval officers to England in London on July 9th, King Edward took occasion to make an emphatic declaration in favor of closer relations between the United States and Great Britain. The Americans were further entertained at a

dinner given by the King in their honor at Buckingham Palace, upon which occasion Ambassador Choate was present and gold plate brought from Windsor was used. On the conclusion of the dinner his Majesty, in a tactful manner, expressed gratification at the acceptance of his invitation and cordially welcomed Rear-Admiral Cotton and his squadron to England. Ambassador Choate also spoke. The visiting American officers were also entertained at a luncheon given by the Pilgrims Club, at which all the American and a number of the British officers were in uniform. After the luncheon Ambassador Choate held a reception at his house in honor of the American officers. On July 10th Mayor Samuel gave a brilliant luncheon at the Mansion House in honor of Rear-Admiral Cotton. King Edward and President Roosevelt were toasted. At the conclusion of the affair the naval officers proceeded to the Honorable Artillery Company and were reviewed by H. R. H. King Edward. The *London Times* in commenting on the speeches delivered mentions the unforced note of intimate personal cordiality running through them. The visit of the American war ships following so closely upon that of President Loubet has afforded unbounded gratification to all classes of the English population.

President Loubet's Visit to England

For the first time in the history of the French Republic the President of that country has visited the British Court. Early in the afternoon of July 6th, the "Guichen" bearing President Loubet anchored off Dover and exchanged salutes with Dover Castle. Immediately the Admiral and Captain of the British fleet boarded the French cruiser, and paid their official visits to President Loubet. At the pier he was met by the Duke of Connaught, the French Ambassador, M. Cambon, and a number of other officials. President Loubet's first speech in England was to the Mayor of Dover, in reply to a written address of welcome. The subject of his speech was the motives of interest drawing France and England together, and this indeed was the keynote of the whole celebration. On the way from Dover

to London the railroad was guarded by men standing within sight of each other, and it was observed that everywhere the greatest precautions were taken against accidents to the guest. At the railroad station, for example, every holder of a ticket had to be identified before he was admitted, and had even to furnish evidence of his right to the ticket. At the station in London President Loubet was met by King Edward, the Prince of Wales, and others, and the greeting between the president and the monarch was of the warmest kind. President Loubet when standing beside King Edward reached only to the latter's shoulder. From the railroad station the guest drove to St. James's Palace, from where, after a little rest, he went to Buckingham Palace to visit the royal family. From there he proceeded to the French Embassy, where he received an address from the French community. The principal event of his first day in London was a state banquet at Buckingham Palace, which was one of the most brilliant affairs celebrated there for a long time. In reply to a toast proposed by King Edward President Loubet made this response:

"Sire: I am more than touched by the reception accorded me by your Majesty. In truth, it is addressed to the whole French people. In their name I beg you to accept my sincere thanks. France treasures the memory of the visit you paid her. I am certain it will have the happiest effects and serve in the highest degree to draw still closer the relations which bind the two nations to their common good and in a guaranty of peace for the whole world.

"It is with these sentiments that I propose the toast of His Majesty, the Queen, and the whole of the royal family."

On the next day a dinner was given by the French Embassy to the English Court and other distinguished persons in the capital, and after that there was a gala operatic performance at Covent Garden, where the display of jewels and flowers was extraordinary even for the London season. On the 9th, President Loubet left London for Dover and there boarded the "Guichen," which conveyed him back to France. The visit is recognized as having political significance, altho the German newspapers appear to minimize its importance. The drawing

together of England, France and Italy may have influence on the future politics of Europe.

Russia Russia seems to be investigating the massacre at Kishineff more rigorously than was expected. The Minister of Justice, who is now at Kishineff, has ordered a number of arrests among the better educated classes, and the chief notary of the place has shot himself on account of the unfavorable report of the inquiry into his conduct. Eight hundred arrests have already been made, and as a result of the preliminary examination 350 persons have been remanded for trial to the lower courts. Cases to the number of 450 have been sent to the Court of Appeal, and of these cases fifty-three are indictments for manslaughter. A change of venue has been ordered, and those who are accused of murdering and horribly abusing the Jews will be tried in September at Tiraspol. It is possible, so far as may be judged from present indications, that no petition will be sent to the Czar by the B'nai B'rith through President Roosevelt. It may be that only a note will be forwarded stating that such a petition is in the President's hands.—At a meeting held at Czarskoye Selo, the imperial residence, and presided over by the Czar himself, the Ministers of the Interior, Finance, Agriculture and Justice, and the State Councilor, discussed the Czar's recent manifesto in regard to local government. The outcome of the conference was a determination to strengthen the autocratic bureaucracy rather than to extend local autonomy as the Russian Liberals commonly desire. It was the opinion of all those present that the Ministers will have to deal with many questions which are not really imperial in their scope, but which the local authorities are unable, with their restricted power, to control.—The Grand Duke Alexander Mikhailovitch, the Chief Director of Commercial Navigation and of Harbors, will conclude a contract with the Odessa Steam Navigation and Trading Company to establish regular communication with ports in the Persian Gulf. The Russian Government grants the company an annual subsidy of 200,000 rubles for twelve years. And furthermore the tolls

of vessels passing through the Suez Canal will be repaid to the company by the Government.

The Hungarian Situation

The strain upon the bonds connecting the dual kingdom of Austria-Hungary becomes greater every day, and the Hungarian party of independence has secured a startling triumph, altho it is doubtful whether the various factions are homogeneous enough to hold the advantages of their present position. The Banus of Croatia, Count Khuen Hedervary, appeared before the Executive Committee of the Independence party and offered great concessions on the obnoxious Army Bills, abandoning governmental demands for new howitzer batteries and 16,000 supernumerary recruits. Altho this was a greater reduction than the opposition party had hoped to gain, it did not satisfy the more belligerent section, and M. Franz Kossuth, who had counseled the acceptance of these terms, resigned his position as leader of the Hungarian party of Independence. On the other hand, the weakening of the attitude of the Cabinet on the military bills so angered the pugnacious Baron Fejervary, Hungarian Minister of National Defense, that he resigned this position, which he has filled since 1884. The surrender of Count Khuen Hedervary to the Hungarian Independence party, while strengthening that party greatly, has given him the leadership of the new Cabinet, which is made up as follows:

Count Karl Khuen Hedervary, Premier and Minister of the Interior.
 Dr. Ladislav de Lukacs, Minister of Finance.
 Dr. Julius Wlassics, Minister of Public Worship and Instruction.
 Dr. Ignatius de Daranyi, Minister of Agriculture.
 Dr. Alexander Plosz, Minister of Justice.
 Dr. Louis Lang, Minister of Commerce.
 Major-General de Kolossvary, Minister of National Defense.
 Professor Nicholas de Tomasich, Minister for Croatia.

The program of the Premier, or Banus, as he will probably continue to be called, is not startling. He will govern with the support of the old Liberal majority.

Egyptian Discoveries

In his excavations at Abydos in Egypt, Prof. Flinders Petrie has brought to light at a depth of about 20 feet no less than ten successive temples, ranging in age from about 5000 to 500 B.C. In the plans of these temples built one upon the ruins of the other, something can be seen of the changes from age to age through the whole Egyptian history. In some places the walls of mud and brick were so mixed up with the soil that the spade had to be laid aside and sections cut with a sharp knife. It has been discovered from various signs that Osiris was not the original God of Abydos, but that a Jackal god and the god of the West were honored here down to the XIIth dynasty; and it is seen that about the IVth dynasty the temple was abolished and only a great hearth of burnt offerings is found, with votive clay substitutes for sacrifice. This corresponds exactly with the story of Herodotus that Cheops had closed the temples and forbidden sacrifices. Of Menes the founder of the first dynasty he discovered part of a large globular vase of green glaze with his name inlaid in purple, and thus polychrome glazing is carried back thousands of years before it was previously known to exist. Pottery of forms and material hitherto unknown in Egypt belonged to this remote age, and proves to be like that in Crete of the late neolithic age. The head of a camel modeled in pottery carries back the connection of that animal with Egypt some 4,000 years; hitherto no trace of it had been discovered there earlier than Greek times. Professor Petrie complains that the growing lawlessness in Egypt has made his work extremely difficult. Petty crimes of the most annoying sort are perpetrated constantly, and it is impossible to get the police to take any cognizance of them. It is impossible to elicit the truth at trials. Witnesses are examined by petty officers who dictate the final statement of evidence as it pleases them; and the witnesses are summoned through their sheikh, who is the first man to receive bribes from the guilty. At one time Professor Petrie's workmen were subject to a general conspired assault in the market place and robbed of all the money they had. No redress could be had. The threats have grown

so serious that he declares it has become necessary to look to their own resources rather than to the law.

**The Greek Cabinet**

The refusal of the Greek Government to grant a monopoly to the currant growers has stirred up an incipient revolution in that country. In the Morea, where the matter is of most serious importance to the people, many of the agitators have armed themselves and go about shouting "The monopoly or death!" The peasants about Pyrgos have wrecked the railroad at several places because the troops have prevented them from seizing the trains and going to the King at Athens with their petitions. On July 8th Premier Theotokis in the Chamber announced the resignation of his Cabinet, which had been formed only ten days previously. There was wild excitement among the members, with uproarious noise and the exchange of blows. In announcing his resignation M. Theotokis declared that the Opposition was fomenting illusions throughout the nation which could never be realized. He said that the people were in a dangerous state of tumult and that to repress the outbreak the troops would have to be called upon. This the Cabinet did not wish to do, and so resigned. At the conclusion of his address the storm broke. The President immediately suspended the session, and an hour later when he attempted to reassemble the House there was no quorum present, as the Opposition members had all followed M. Delyannis, their leader, to his home. Three days later a new Cabinet was constituted as follows:

M. Ralli, Premier and Minister of Foreign Affairs and ad interim Minister of Finance.

M. Mavromichalis, Minister of the Interior.

Colonel Constantinides, Minister of War and ad interim Minister of the Navy.

M. Merlopulo, Minister of Justice.

M. Pharmacmaeoulo, Minister of Public Instruction.

M. Pharmacmaeoulo is a nephew of M. Delyannis, the former Premier.

The Boyhood of Leo XIII

By Salvatore Cortesi

IN an up-to-date city like New York it is difficult to imagine the life and surroundings of the former generations, but at Carpineto, Italy, where Pope Leo XIII was born and passed his boyhood, every generation is like the previous one. The same steep and narrow roads, up which he ran on some errand for his mother; the same old buildings frowning down on slits called streets, in which the sun's rays seldom or never penetrated; the same donkeys (or *fac-similes*), the panniers of which so fill the space between house and house that one has to flatten himself against the wall to allow them to pass; the same types of men, women and children; the same costumes, habits and prejudices; the same eternal hills, bare, majestic and severe, rising to great heights about the little town, which is itself perched upon a mount about 3,000 feet above the level of the sea.

Here Gioacchino Pecci, nearly a century ago, played, worked, studied and, I suppose, suffered childish ills—happy

dispositioned, strong as a goat of the hill-sides, clever and gentle.

The Pecci family occupied then, as now, the chief house (called in Italy a palace) of the town, with wide frontage to the mountains, containing large and lofty rooms, with tiled floors, gilded furniture upholstered in red, many family portraits and huge and generous windows looking out on the lightning, mist and clouds, among the peaks, or sunshine, which made glorious the rocks and the few scrubby trees on them.

Of the parents of Leo XIII little is now known. His father, Ludovico, was a colonel under Napoleon I and was conspicuous for his boldness in an age of brave men. In the family register, preserved with great care, we find the following notice, under the date of November 27th, 1791:

"To-day Signor Ludovico Pecci married Signorina Anna Francesca Prosperi of Cori. The newly married couple were taken to Carpineto in a calash by Signora Marianna Prosperi, the bride's mother, by Count de Cateldi,

and many other notables of the place. The marriage *fêtes* will last 15 days."

The fruit of this union was five sons and two daughters, all of whom died much before Gioacchino (Leo XIII). In the register, which I have had the honor of seeing, the birth of the future illustrious occupant of the chair of St. Peter is thus recorded:

"2nd March, 1810—Near the twenty-third hour and a half came into the world a child of the masculine sex, to whom has been given the name of Vincenzo Gioacchino Raffaello

the serving maids did their work and spun their stint of flax and wool, and looked after the education of her children in their tender years. With all this care the household seems not to have had much over and above the daily needs, so Donna Anna introduced the silk worm into the village, and through it gained sufficient income to send two of her sons to college. Besides so many occupations she had time to devote to neighborhood charity and to inculcate into her children those principles of honor, honesty and

Leo XIII Resting in the Vatican Gardens

Luigi. He was held at the baptismal font by Mgr. Gioacchino Tosi, Bishop of Anagni, but this dignitary not being able to come personally sent in his place Canon Don Giacinto Caporossi. The godmother was Signora Candida Caldarossi. The ceremony was celebrated in the chapel of the palace by Canon Cattoni."

Donna Anna proved the best of wives, adding materially to the family income. It appears to have been she who rode daily to overlook the vineyards, gave orders for the rather meager harvests, watched the making of the wine and oil to see that nothing was wasted, saw that

love of family which have been so conspicuous among the members of the Pecchi house.

Little Vincenzo (he was not generally called Gioacchino until later) grew up in a somewhat rigid but pure, charitable and healthy atmosphere, where—as we learn by his letters written from school at the age of nine—his father was always the *Signor Padre* and his mother the *Signora Madre*. He was taught hard work as a principle, which was his guide all through his long life. As a tiny fellow he was allowed to tumble and roll

about the gardens and vineyards, but not many years had passed in his life when he was put to small tasks, and at five his education began. He took to his lessons with avidity, so that at nine years of age he was already proficient in Latin and wrote a hand which any boy of 15 or 16 might be proud of to-day. From the slender records left of those far off days I should judge that there was much work and little play, and what there was of the latter took the form of shooting expeditions on foot among the hills, an occasional game of ball and a devouring of the books of the small parental library. The daughters in odd hours were set to spinning, while the boys helped about the vineyards, looked after the animals, riding the mules and horses bare backed,

The Leonine Tower, Vatican Gardens

drawing in health and strength from the pure mountain air. The expeditions among the hills, however, were not looked upon with great favor by Donna Anna, as brigands were by no means uncommon and children had been known to disappear until a ransom was forthcoming. Gioacchino and his elder brother were, in fact, one day shooting when they stumbled upon an encampment of some five or six men. In their astonishment and fear they called out "Brigands!" taking to their heels. Two of the men, it is supposed to give them a fright, followed hard behind and even clutched at Gioacchino's cap, who arrived breathless and hatless at the village with the tale of his escape. The two boys were firmly convinced that they had seen the fascinating and mysterious

The Round Room in the Leonine Tower

brigands, but the fact that the lost cap was later seen hanging on a nail in the hut of a respectable shepherd went very far toward reassuring their parents. Notwithstanding this "adventure," hunting and climbing continued to be the future Pope's chief passion. At the Pecci palace is still shown the old flint-lock which served to bring down many a bird and must have been the same which the Pope carried on the memorable day mentioned above.

In leisure hours, when not at these amusements, he was usually to be found, book in hand, under a tree in the garden, dreaming, one may suppose, of his future career in the Church, for he decided very young to take Holy Orders. Of his relations with his brothers and sisters no record is left, but the devotion felt for him by the late Cardinal Giuseppe Pecci was eloquent testimony to what the others must have felt. His letters from the Jesuits' School at Viterbo give very little indication of his tastes or ambitions, being for the greater part inquiries for the health of his family; but in one we come across a glimpse of the "old Adam," when he asks for a writing desk for himself, "as all the other boys have them."

Love of woman seems never to have touched this ascetic. For his mother he retained to the day of her death a tender affection which must have repaid her for all her sacrifices, but in no record or anecdote is there any hint of warm friendship with the other sex, his thoughts from early youth having been given to the Church and unworldly matters.

Giaocchino early showed his poetical ability, which in later years came to be so remarkable a gift. At the age of twelve, when at the College of Viterbo, he composed the following Latin quatrain:

"*Nomine Vincenti, quo tu Pavane vocaris
Parvulus atque infans Peccius atque ipse vocar.
Quas es virtutes magnas Pavane, secutus,
O! utinam possem Peccius ipse sequi!*"

And a little later in the short time given the class during an examination he composed 120 hexameters.

About this time his health gave some anxiety to his family, but his strong constitution triumphed. However, he later became so delicate that on his accession to the Papal throne every one, even he himself, believed he would not live to see the year out. It is recounted that when,

Bedchamber of Leo XIII

on the second scrutiny at the Conclave, it was apparent that he would be elected, he turned to his neighbor and said, "So you want to have another Hadrian V," who, it will be remembered, only reigned 37 days. It would be interesting to know why Leo XIII chose Hadrian V as an example, as there were other pontificates of even less duration, as, for example, those of Leo XI, who reigned 27 days; Pius

III, 26; Boniface XI, 15, and St. Stephen, only 3. But the delicacy would seem to have been more in appearance than in reality, for even after the removal of a cyst at the age of 89 he appeared to gain in strength, so that he went through the Holy Year, which he revived for the first time after the fall of the Temporal Power at the end of the nineteenth century.

ROME, ITALY.

A Song of Harvest

By Annie Weld Edson Macy

ROUGH-TILLED the field this scanty harvest bore,
Good my Liege Lord;

My beast is old, his feet were lame and sore,
Tough was the sward:

I could not beat him as he tugged the share.
Sometimes we rested, drinking in the air,
And listening to the wild, triumphant note
That gurgled from some wayside songster's
throat.

And once—(I beg you chide me not in wrath,
Good my Liege King!)

A clump of violets right in the path
Lay blossoming:

I could not tear its beauty with the plough,
And so we went around it—and I vow
That wretched furrow set the rest agley
And all the others followed the same way!

And when time came to sow—(have patience,
pray,

Kind Liege and good),
She came, and brought the weanling all the way
With wine and food:

And nought would do but he must help me sow
And spill the grain, and trample in the row,
I could not chide the merry little lad,
His very mischief makes my old heart glad.

Then Drought came down and parched and
sealed the soil,

Good King, my Liege;

But half my grain, despite my earnest toil
Withstood the siege:

So now to-day my spirit inly grieves
To bring as tithe so scanty store of sheaves.

And since there sure was room, and by your
grace,

Good Liege and kind,
I've put the lad atop the vacant space,
And wife behind;

Many a jeer and taunt has met my load
As fleeter steeds have passed us on the road
But then I'd think of wife's brave ribbons blue
Her patient eyes, her holidays so few.

* * * * *

(THE LORD OF THE HARVEST.)

Give pause, good fellow—See that creeping
train

Of frowning churls, impetuous with the goad,
Who fret the oxen, stumbling 'neath their load
Their cruel overload, of tribute grain?

Hopeful, mine eye hath scanned them all in
vain,

Ere in my barns their offerings were bestowed
Alas! not all that boasting crowd have showed
The luscious yield that piles thy wretched wain.

Humility's sweet fruitage, pale and rare,
Domestic loves in generous clusters twined,
Good deeds, outpoured in bounteous increase

On all dumb helpless things that need thy care;
All these thou hast, the hardest far to find,
Thy tithe sufficeth me—Depart in peace!

HANOVER, MASS.

When the Pope Dies

By Henry C. Vedder, D.D.

[This article, by the Professor of Church History in Crozier Theological Seminary, is made up from two articles of his that were printed in *THE INDEPENDENT* in 1899. We reprint the gist of them here, as they seem to us to give the best account of what happens at the death of a Pope that has appeared in print.—EDITOR.]

WHEN the Pope becomes so ill that a fatal result is apprehended, his Secretary of State informs the dean of the College of Cardinals, who at once betakes himself with his colleagues who may be in the city to the Papal residence. The Cardinal Vicar is also informed, that he may cause prayers to be offered in all the churches. Generally the diplomatic corps is 'also notified. When the physicians decide that death is imminent the Cardinals and the Pope's household gather around his bed. The Pope's confessor, and the Cardinal who holds the office of Grand Penitentiary, together receive his last confession; the Pope's Sacristan, an Augustinian monk who is titular bishop of Prophyry, brings him the holy Viaticum and administers the sacrament of extreme unction. This done, if the Pope is still able to speak, he recites the Tridentine profession of faith to the Grand Penitentiary, who thereupon pronounces the grand absolution and the formula of indulgence in the article of death. The generals of the various orders are also present at the death-bed and bestow the indulgences that they have the privilege of conferring. For the Pope, tho he holds the keys of heaven and hell, and can bind and loose on earth as God's viceregent, holds these powers as trustee for the Church, and cannot use them for his personal benefit; he must himself receive spiritual consolation like any other Catholic, even the humblest.

If the Pope is able and desires to do so, he now speaks farewell words to those about him, and indicates his wishes concerning his successor—which, however, the Cardinals are in nowise bound to consider. After this the Sacristan recites the commendation prayers, "Depart, Christian Soul," etc. As the last moment draws nigh the Penitentiaries of St. Peter's (Franciscan friars) chant the psalms of penitence. No one quits his place until the last agony is over. Then the Secretary of State immediately notifies the Cardinal Chamberlain, who becomes for the time being the executive of the Papal Government.

Clothed in a violet robe, accompanied by the prelates of the chamber, the Chamberlain enters the room where the dead Pontiff lies. The face has been decently covered with a white cloth. About the bed the Franciscan

Penitentiaries are still chanting psalms and the office for the dead. Kneeling on a violet pillow, the Chamberlain offers a silent prayer; then, as he approaches the bed, the attendants remove the cloth, and with a silver hammer he strikes thrice on the forehead of the corpse, repeating at each stroke the dead man's baptismal name. "Gioacchimo! Gioacchimo!! Gioacchimo!!!" the Chamberlain will say, when he performs his office over the body of Leo XIII, and then he will turn to those surrounding the bed and say, "The Pope is really dead." All then kneel, while he recites the "De Profundis," with the prayer of absolution, and sprinkles the corpse with holy water.

The official known as the Master of the Chamber then draws from the finger of the dead his special symbol of auctority, the so-called Fisherman's Ring, and hands it to the Chamberlain. This, as well as the Pope's other seals or "bulls" of lead, he breaks in the presence of his colleagues at the first meeting of the college. It is his privilege also to place the new Fisherman's Ring on the finger of the succeeding Pope, when the results of the decisive ballot shall have been announced. In the meantime the Papal jurisdiction symbolized by that circlet remains suspended. A prothonotary now reads to those present the formal record of the Pope's decease required by both ecclesiastical and civil law.

This completes the ceremonies at the bedside. The Chamberlain now retires to an adjoining apartment, and makes to various officials the formal announcement of the Pope's death. He gives orders for the notification of the Cardinals and the approaching conclave. These notices were always sent in the ancient cumbrous methods until the death of Pius IX, when Cardinal Pecci had the good sense to use the telegraph, much to the scandal of some good souls. The precedent is likely to become permanent.

At the same time the corpse of the Pope is being prepared for the last rites. It is first embalmed, the viscera being placed in a marble urn and taken at once to the basement of St. Peter's. The body, after the embalming is completed, is clothed in full Papal vestments, and exhibited to all in the palace for some hours. After this, the general rule is to take it to the Sistine Chapel, where it remains for the night.

In the case of Pius IX, who died toward night-fall, for fear of tumults it was thought best to remove his body directly to St. Peter's during the night. When the body arrives at this, its final destination, it is placed on a great catafalque, about which twelve tapers of yellow wax are lighted.

While the dead Pope thus lies in state, high mass is sung each day for nine successive days, the last three days being known as the "great funeral services." On the ninth day a sermon or eulogy is pronounced. For some reason not very clearly understood, but eight days were actually consumed by the obsequies of Pius IX, to the great astonishment and scandal of the learned in such matters.

At the first entombment the relatives of the Pope are present, and the Cardinals that he created, together with the immediate household, and the Chamberlain. In the cases of Gregory XVI and Pius IX all the Cardinals were invited to be present, but this is not usual. The monks of St. Peter form a procession, singing the "Miserere," and the *cortège* passes through the side nave of the church to the place of sepulcher. Many complicated ceremonies accompany this part of the service which it were bootless as well as wearisome to describe in detail. The body is at length lowered into the temporary tomb, until the permanent mausoleum can be made ready. During the next three days the Cardinals meet in the hall of the consistory, there receiving the ambassadors of various nations, who bring the condolence of their governments.

Immense sums were formerly spent on the funeral obsequies of the Popes, and it was found necessary to set a limit to this extravagance. Pius IV decreed that the cost should never exceed 10,000 ducats, or, say, \$18,000. Alexander VIII reduced the maximum to about \$10,000. The tendency has been more and more to keep well within this sum, and it was officially stated that the funeral of Pius IX did not cost over \$4,000. Compared with the cost of royal functions, this is not a large sum. The funeral of the Duke of Wellington or that of General Grant must have cost a far larger sum, yet in those cases probably nobody deplored the expenditure as a waste—certainly nobody whose opinion was worthy of attention.

The meeting of the Cardinals for the election of a Pope is called a conclave, from *clavis*, a key. The name is justified by the fact that during the election the princes of the Church are actually under lock and key. This custom arose out of stern necessity, and can be traced back no further than the thirteenth century. Several times in those troublous days the need of an immediate choice became so imperious that the people returned to the expedient of shutting the college up until an election was made.

In the Middle Ages a Papal election might

be held almost anywhere in Southern Europe, but for a long time there has been no election out of Rome, and usually the Conclave is held in the Vatican. The Conclave that chose Pius VI in 1775, however, was held in St. Peter's. Directly after the death of a Pope, under the direction of the Chamberlain, the arrangements are made for the coming gathering. For centuries it has been the custom to erect little wooden cells, each about nine by twelve feet: and the materials, numbered for putting together, were kept always in readiness. At the Conclave of 1878, for the first time, these cells were not used, but small apartments of three or four rooms each were specially constructed in the great halls of the Vatican. These little suites were much more convenient than the cells, since each Cardinal is allowed two attendants, who were thus able to lodge near him and be constantly at his service. On the other hand, the arrangements necessitated the spreading of the Cardinals over a large space in the palace, which made communication less easy.

On the morning of the tenth day after the death of a Pope occurs the inaugural of the Conclave. The Cardinals form in solemn procession in order of rank, and usually proceed to St. Peter's, where the mass of the Holy Spirit is sung, at the close of which a sermon is delivered by some ecclesiastic previously appointed by the college. This is known as the election sermon (*Pro Eligendo Pontifice*), and the preacher's duty is to exhort the Cardinals to lay aside all prepossessions and preferences of their own, and to fix their eyes on God, so that as speedily as possible a shepherd may be chosen who may be equal to the exigencies of the times. A master of ceremonies then takes the Papal cross, and behind him follow the Cardinals. Before the cross go the attendants, and the Pontifical choir singing *Veni Creator Spiritus*. Having arrived at the chapel of the Conclave, the dean of the Cardinals reads the Apostolic Constitutions relating to the election of a Pope, and each Cardinal takes in turn an oath to observe them. The dean exhorts them to fulfil the obligations resting on them in so grave a matter as the election of the head of the Church, and the Cardinals then betake themselves to their cells or apartments.

In the afternoon the college meets and receives the oaths of all the officers and attendants of the Conclave. Of these there is a large number, of which it is necessary to specify only two: a Governor, who is a prelate, and a Marshal, a secular officer. In the evening the Conclave is officially closed. Then all except the Cardinals, their authorized attendants and the sworn officials, are required to leave the palace. All doors save one have been walled up ere this; now the last is locked, and the keys placed in the keeping of the Chamberlain. The Governor and Marshal henceforth keep strict

charge of this door, and both egress and ingress are forbidden. To this rule there is an exception, however: a Cardinal arriving late must be admitted, and a member of the Conclave may be permitted to leave on account of sickness. Three Cardinals with the Chamberlain verify the report of the officials that all but those having business there have been excluded, and the Chamberlain usually makes a further round before retiring for the night, to assure himself that all is right. Even when these precautions have been taken the number of persons left is considerable. At the Conclave of 1878 over 250 souls were thus locked into the corridors of the Vatican.

The night is spent in silence, the hours not given to sleep being presumably devoted to prayer and pious meditation. The Chamberlain does not trust too much to his charitable presumption, but stations sentinels to see that no communications are held in secret during the night. In spite of this Cardinals do manage to prowl about and electioneer every night while the Conclave continues. On the following day the real business begins, that of election. In theory there are three methods by which a Pope may be chosen. The first is election by "inspiration," "acclamation" or "adoration," for all three terms are used to describe it. This is accomplished in those rare cases when all minds turn at once to some one as the sole possible candidate, and he is saluted by unanimous acclamation. The election of Gregory VII is described as occurring in this way. The obsequies of Alexander II were performing and Hildebrand as Archdeacon was directing them. All at once clergy and people with one voice cried out, "Hildebrand is Pope! It is the will of St. Peter! Hildebrand is Pope!" And he was immediately enthroned and crowned. Such elections, however, tho always possible in theory, have always been rare, and none has occurred in recent time. Another method is known as election "by compromise." Not infrequently a deadlock occurs in a Conclave, and the Cardinals agree to refer the election to a committee, and to abide by its decision. Elections by this method have been most infrequent, but it has not been necessary to resort to it latterly. The commonest method is now, and probably always has been, election "by simple ballot."

The rules of Gregory XV for the preparation of ballots are curiously minute; in connection with his bull, *Decet Romanum Pontificem*, he not only gives a full description, but diagrams accompany the text as sample ballots. The voting is secret, and therefore the ballot is in three divisions. In the upper part of the ballot each Cardinal writes his name and title, thus: "Ego Robertus Card. Bellarmine." This he folds down and seals, and it is not examined, save it becomes necessary to verify all ballots. In the lower division he writes a number and a

motto, known only to himself, so that he may be able to identify his own ballot in case of necessity, thus: 18. *Gloria in excelsis*. This he folds up and seals. All that is visible to the tellers is the middle part of the ballot, in which he writes: *Eligo in Summum Pontificem Rev. D. meum Card. . . .*, filling the blank with the name of his candidate.

In general only a member of the College of Cardinals has been regarded as eligible to the Papacy, since the time of Nicholas II. But he admitted exceptions to this rule in case of necessity, and as a matter of fact, between his day and that of Urban VI (1378) nine Popes were chosen from outside the college. Since that time none but a Cardinal has been elected, and the precedent has by this acquired practically the force of law.

The voting sessions are held in the Sistine Chapel, and two ballots must be taken each day, the first directly after the morning mass, the second in the afternoon usually about 4 o'clock. About two hours are ordinarily required for the taking of a vote. When the votes are ready to be given, each Cardinal advances in order of rank to the altar, where the tellers stand, kneels and offers a short prayer, and then, holding his ballot over the great silver chalice that serves as an electoral urn, he repeats in a loud voice the electoral oath: "I call to witness Christ the Lord, who will judge me, that I choose him whom I judge before God should be chosen, and I will do the same on the 'accession.'" Then, laying the ballot on the paten, he causes it to slide into the chalice, salutes the cross and returns to his place.

When the votes have been verified and counted and the result is announced, if nobody has received the necessary two-thirds majority, Cardinals have the privilege of changing their votes. A ballot of the same general character as the one before used is prepared, but in the middle each writes *Accedo Rev. D. meo Ego Card. . . .* If he does not wish to change his vote he writes in the blank space *Nemini*, nobody. At the last Conclave a nervous or absent minded Cardinal wrote in his first ballot *Eligo, etc., Card. Neminem*, and the ballot was read out by the tellers amid the hilarious laughter of the Cardinals. Even these grave ecclesiastics, engaged in this most solemn business, it seems, are not incapable of appreciating a joke. It sometimes happens that exactly two-thirds of the total number of votes have been cast for somebody. In that case all the votes are carefully verified; the tellers open each one, and if it turns out that any Cardinal has voted for himself the result is invalidated and there is no election.

After the concluding of the voting the ballots are burned in a little stove kept for the purpose; and when the people gathered without see the smoke go up they know that no Pope has yet been chosen. This is supposed to

be their only means of information, for besides the oath of secrecy imposed on all inmates of the palace, no communication with outside persons is permitted, except in the presence of the Marshal and Governor. Nevertheless, in some way the secrets leak out, and the proceedings are reported from day to day with tolerable accuracy. The rules of Gregory XV provided that if a choice were not made within three days, for the next five days the Cardinals should be restricted to one dish at each meal, and thereafter should be confined to bread and wine or water. These rules have been relaxed in these later times, but long deadlocks have also become infrequent.

Will it surprise anybody to learn that, notwithstanding all these strict rules and these solemn oaths, there is often a great deal of wire pulling and electioneering in a Conclave? Since Cardinals are but human, after all, we ought perhaps to expect nothing else. The shrewdest American politician, trained in all the tricks of caucuses and conventions, could teach these princes of the Church nothing. Cases have been notorious in which Pontiffs have secured their election by promises of preferment and other advantages to their fellow Cardinals. Equally notorious are cases in which Cardinals have forced pledges from a colleague as a condition of election, which he has afterward repudiated or fulfilled only under severest pressure. And as so often happens in our Presidential contests, the successful candidate is frequently not one of the several who have been hotly pressed by friends, or have used all their arts to advance themselves, but a "dark horse." Some of the ablest and best, and also some of the weakest and

worst, of the Popes have been chosen because the favorites were only strong enough in the Conclave to kill off each other.

When, by any of these methods, an election has been made, the dean of the Cardinals goes to the Pope-elect, and in a loud voice asks, "Do you accept the election, canonically made, to the supreme Pontificate?" The answer is communicated to the assembly by the prefect of ceremonies. By a second question the dean asks the new Pope what name he wishes to take, and on receiving his reply announces it in a loud voice to the electors. The official act of election and acceptance is then prepared, and in the meantime the Pope is conducted to the altar, if he has not gone there at once on notification of his election. The robes of a Cardinal are removed, and the Pontifical garb, made ready in advance, is put upon him. He is then placed on a chair, back to the altar, the Chamberlain puts on his finger the Fisherman's Ring, and all the Cardinals in turn give him the first obeisance, kneeling before him and kissing his foot and hand, and receiving from him the kiss of peace. The first official act of the new Pontiff is to confirm the powers of the former Chamberlain, or, if he prefers, to appoint another.

Preceded by a choir singing *Ecce Sacerdos Magnus*, the senior Cardinal deacon goes to the balcony and says to the people: "I announce to you a great joy. We have as Pope the most eminent and most reverend ——— Cardinal of the Holy Roman Church, who has taken the name of ———." And thus the world is made aware that the Church has a new Pope.

CHESTER, PA.

The Flower

By William Hamilton Hayne

THERE is a flower we cannot find,
Whose home is on a hight,
Some mountain peak of soul or mind
Above our veiled sight.

Tho yearning Fancy pictures it,
In day-dreams brief and bright,
Where countless rays of glory flit
And nourish it with light.

Our eyes the Vision cannot hold,
So beautiful and fleet,
The petals of perpetual gold,
The perfume heavenly sweet.

And thus we know the wondrous flower,
By dust of earth unstained,
Was born in some celestial hour
And called The Unattained.

AUGUSTA, GA.

A Summer's Day in the Country

By E. P. Powell

AUTHOR OF "WIND BREAKS, HEDGES AND SHELTERS," "OLD FARM DAYS," ETC

A SUMMER day in the country is eleven hours long. If you sleep from eight o'clock until three o'clock you will get seven hours; and if from one until three in the afternoon you will get two more, or nine hours of sleep—which is enough for anybody, and it gives you the enjoyment of the best fifteen hours. If you live in the country both rime and reason wake you at three in the morning through May, June, July and August. These are the months of bird song; and what you are in the country for if you do not keep company with folk I do not know. The most wakeful hours of the whole twenty-four are from three until six in the morning, and from five until seven in the evening. These are the sweetest with the flowers, and the richest with bird music and the fullest of plant fragrance. My memorandum reads:

Waked at just three o'clock. I could hear in the far off east a single bird song—the advanced and advancing note of the Choral wave, that started one hour ago at the Atlantic, and is on its way to the Pacific. It is away down in the valley, and moving very slowly toward me. One bird joins in after another. It is the robin's song; high, jubilant and overlooking. Ah, but you cannot think too highly of this priestly singer. He cares little for common things. He watches the days as they move. He turns the world's prose into melody. He greets the dawn; he welcomes the day; he praises Life. Nearer, and still nearer, one after another strikes the key, until the whole valley rocks and rings with song. Breast illumined with the dawn, full of faith, they give the muezzin call, God is God! We are his children! On earth peace!

It was a full half hour before that chorus reached the house. What a marvel of nature, all up and down the States for hundreds of miles that melody rose by the sea shore at the first touch of dawn and is rolling westward. At

last my robin, the one who homes in the apple in the nearest corner of my orchard, gave the signal, and all about my house dozens of birds fell in with a shout of joy. Just over the hedge my catbird is whistling low to himself, picking up new notes; but he is too individualized to make one of the crowd. He is simply making a study of what the other birds are doing, and will be heard from in good time, with note and comment. Another half hour and the great wave of music will have moved on westward with the dawn. Robins already begin to come down to earthly things and daily duties. They rarely sing after this morning hour until evening, unless there be some such special topic to discuss as a soft summer shower and a clearing off with rainbows.

At four o'clock the catbirds have it all to themselves; and they will not only sing their hearts out into the trees and the sky, but they will give us imitations and will sing over again all the sounds and melodies that they have heard. My nearest neighbor, who builds in the Tartarian honeysuckle, comes near to me with evident comprehension of my admiration, and undertakes to tell me that he is not like other birds, but understands human folk. He jumps about the limbs near to me, and with whistle calls back and forth; I envying his musical ability, and he possibly wondering somewhat about my books and my balconies. I should be very lonely in the country without the catbird. He only has the power of companionship with us.

At four o'clock I was out of bed, and was clothing myself with the delicate drapery of fresh morning air and grape perfume—for just now the grapes that run over my verandas and porches are full of bloom. It is the most complete odor that nature distills. I have a sun-bath window; huge, welcoming and hearty. Here I sit for a while in the morning, when the sun's rays are soft

and life giving and while the air is undisturbed with irritating sounds of labor. Every wavelet of the air comes soft and smooth and invigorating. My window is a projection of the second story; and the house is away back from the street, as every house in the country ought to be. Nobody sees me, therefore, and as God did not make me with clothes on, I sit in the yellow sunshine and whistle with my bird. He stops a moment, then whistles back. How I love that catbird. Other birds I admire and enjoy, but he is a part of my life. Summer would not be summer without cherry blossoms and catbirds. We have a lot of companionship. He finally comes out of his bushes and sings from the English elm, and then I must be in my balcony. There he darts by me and laughs; and I look at him in the Judas tree or the cherry trees, and wonder if after all there is a little truth in transmigration of souls. Are some of these birds human? If I am ever to transmigrate I will be a catbird, and home it over there in that mock orange homestead.

At half past four the scene changes. I meet my collie in the hall, and we go down and open all the doors and go out for a morning walk. Ah, but you should see her joy. She leaps through the door with a bound and a growl, as is to say, ah, ah! here we are now and we will see to it we shall know what has been going on here in this great world all night while we have been shut in doors. And then we settle down to a delightful ramble among the gardens and orchards; both of us inquiring into the condition of affairs and the coming duties of the day. No country home should undertake to get on without a thoroughbred Scotch collie. Like the catbird in the tree, the collie is a companion and a friend. He is as near human as the animal world can get—as yet. You quarrel over *baptizo*—whether it means going down into the water or being sprinkled by water. Let me tell you to walk through a dew washed air and a dew wet lawn is a baptism more holy than all. Here you meet God himself, and you become clean in soul. Folk and folkness are washed of the atmosphere. It is full of the divine and of sweetness. A man who does not pray is not irreligious, but he is shallow,

lacking in tuition—having eyes he sees not—in fact, he is a moral fool. You may soften that word, but it is the only one to express the truth. The Persian throws a kiss to a star; at five in the morning in June I throw a kiss to God.

I hear Harry; Harry is a beautiful boy who came to me from far away, looking for a father and a home. It is curious that some folk are still without homes in such a world as this; but Harry has found one. His eyes have been covered up all night as the stars are covered all day, but how full of glad light they are now! Every day new thoughts are going in along those soul highways and new love leaps out. As we go to the stables to feed the horse and cow our catbird flits across the paths with shouts almost like laughter. Juno gives a soft loo as we reach the barn gate, and stretches herself anticipatory of sweet hay. All night she has laid in the cool yard, facing the moon, and chewing the cud of happy recollections. Now she reaches her soft nose up to be patted, and then we scratch her neck while her tub is being filled with water. She thinks now of her box stall, and quietly going inside looks up with a sniff for the delicious breakfast that comes tumbling down into her manger. As she begins to eat Harry begins to milk; and a poem, double lined, goes into the pail.

Grosbeaks sing from seven until nine, and they have the world mainly to themselves. I wonder if this is a joint arrangement among the bird family. I do not know about that, but I do know that now there is to be heard everywhere that curious warble, a sort of throwing of the shuttle of song, winding up with *chu chu*, or possibly a single *chu*, or a whole string of these ejaculations. Is there such a thing as telegraphing in the bird and animal world? I am almost sure that there is a special meaning in all song variations, but I am not so sure about these dots and lines, which are very much like those made by a telegraph instrument. My collie likes to get into conversation with a neighboring dog, and they keep it up by the hour. What are they saying? What does she mean by bow-wow; and then, after the reply has come, by bow-wow, repeated two or three times? I observe that sometimes it is a

single, short, sharp stroke of the voice, and then it is two strokes, and sometimes three or four. All these are accompanied by slight changes of circumflex. What can they be but the dots and the lines in dog telegraphy? Perhaps you think that these dogs are barking simply to make a noise; I don't. I believe that they are talking to each other intelligently; and I believe also in sky talk.

Soon after seven the sun looks down over the tops of the trees, for it has climbed high up in the sky, and says: "Now, I have given you a good, long morning with the dew, I am going to drink it up, and as for you, you must take off your coats and roll up your sleeves while I make the corn grow and paint the cherries red." The work hours have come both for sun and for man, but we will see if we can keep a little poetry riming with the hoe and the plow. Lilah goes off with a rush to look down the driveway, east of the house, to see if Ned, the hired man, is on time. Her tail wags in the distance, which is as much as to say, Yes, yes, yes; There he is! Now everything is ready. And then back she comes with a joyous bark to announce the fact that nothing is going wrong. The scythes have already been ground in the shop, on an emery stone, by the gasoline engine. It has been quick work, and no boy's bones ache. And now with Ned and Bert behind them they march through the grass with a sharp, quick clip.

"O sound to rout the brood of cares,
The sweep of scythe in morning dew;
The gust that round the garden flew,
And tumbled half the mellowing pears."

It is a beautiful sight to see the swaths lie, even, true and steady. Over the fence our neighbor's Tim, a short, stumpy fellow with a face like a full moon, sings out, "The top o' the morn'ing to you, Sir!" And to him I throw back "The cream of the day to you, my boy!" And now at it they all go, with a merry spirit of rivalry, while down the hill our neighbor Harding's mowing machine rattles across the great meadow. Philip tosses out the swaths to dry while we all watch the clouds with calculations and prophecies. "The swallows fly low," "The cat eats grass," "The smoke drops down from the chimney." Yet after all

the best rain prophecy that I know is nerve irritability. If the boys are easily provoked (myself also) there is likely to be a shower. Still all signs fail in a dry time, and so we go ahead, laying down and tossing out the grass. At no other time is the farmer so alert, so anxious, as during these haying days. Good, sweet hay, not touched by rain, makes the difference between happy, fat animals and those that just winter through and hardly pay for their keep. "June hay makes winter play." There is nothing sweeter in the world than a meadow of clover hay, just curing into preparation for the mow.

In the plum orchard the boys are carrying about sheets which they spread under the trees, and then with a long padded rammer they jar the trees. The curculios fall off and play possum. While they are curled up with a pretense at death, keen eyes distinguish them and they are ruthlessly crushed. This must be done twice a day for two weeks to secure a plum crop. To-day the sheets will be rolled up and stored till another year requires a renewal of the contest. The spraying cart and hose are driven about the orchard, where every tree of apple and pear is covered with Bordeaux, lime and arsenic. This is the third spraying of the year, and there must be a fourth. When the orchard is done the cart will go through the potato field with paris green; and then through the vineyard with copper sulphate. Only by this alertness and by the aid of science can the farmer and orchardist come out ahead of our rivals, the insects.

So goes the heart of the day. Duty, however, is always tempered by study and by investigation. Every boy has in his pocket a box to receive samples of whatever insect he happens on; and later in the day these will be arranged for investigation in the laboratory. The noon-ing is two hours long, unless the day is lowery or the tasks are multiplied by rain or by drought. During these rest hours there is sleeping or reading in hammocks, while others are in the laboratory feeding their beetles and watching the development of chrysalids. In this way our eyes and ears are opened, and entomology and botany a good deal more than doubles what we see and what we

near. The world is made larger and richer and more homelike.

Americans should learn to sleep after dinner. It is a law of nature. It is healthful and it conduces to long life. It is especially important for old age—that is, from seventy to one hundred and twenty; but it is advisable for middle age—that is, from fifty to seventy; and it really should be the habit of boys and girls at forty. It preserves elasticity. No animal, except man, believes that an all day steady pull is required or possible. Let your household be arranged for a quiet two hours after dinner.

At six o'clock there is a vesper service of the birds, mostly solos. The leader of the robins sits high on the tip of an apple tree or an elm, and tells us great truths and sings great loves, and others respond. But especially does the wood thrush select this hour for his silver ringing. He comes to our well-shaded homes where he is happier than he used to be in the woods, for really the wood birds are such only for safety. Everything in the world naturally loves man, if man will only be manly—that is, honest, gentle and lovable. There are suggestions everywhere about us of what a Paradise we might have if we would, and what God's children are sure to have.

Soon after seven the robins are looking about their households, and making a thorough inventory of the hedges and lawns to see if cats or owls are anywhere prowling. The catbird, secure in her capacity for hiding her nest, spends a half hour with you in a sort of good night. Swifts and night hawks are darting about overhead, snipping the flies and insects that fill the upper air. This is the hour of most delicious perfume. Lilies are not so sweet in the day time as in the dew time; altho the roses are more so. The wax plant and the honeysuckles have almost no sweetness until dark; then inaudible wavelets of delicious perfume fill the air. The honey moths respond. The bees are in the lindens

gathering great stores of honey—whole swarms of them are there all day, and they even stay all night. It is a wonderful hour. I think perfume is the language of flowers. Let the flowers and the bees and the brooks now do their talking. Wise folk talk low at night and stop much to think; fools laugh loudly and giggle. Nature only gets to the husks of some people and they rattle. Every emotion has its hour; every creature expresses an emotion. It is not so much what we think as what we feel. Most of the hens are on their roosts, but a few progressives are strolling through the shrubbery after early bugs and late worms. There are investigators among all sorts of animals—discoverers of natural facts. Hens sometimes die of congestion of the brain. But the day has evidently grown tired. Even the rattle of the wagons in the valley says Homeward bound. Horses do not need clocks.

The stars are out at eight o'clock. Mystics and lovers are abnormal in their conditions, and they must wander with the moods and the tenses; but the rest of us may go to our beds. There is a delightful sensation of being blanketed and soothed for sleep in these night sounds—the bugle call of the frog, the inwoven conversation of treetoads and crickets, the monologues of the catbird, and the faraway harmonies of the bubbling brooks; they all together make the lullaby of Mother Nature. No wonder that an owl hooting at this hour is held to be ominous. Honeysuckles fill the dewy air with perfume, while we slip softly into that sweet land of dreams, where there are no laws and neither time nor space, where the dead live and the old is new, and where one may change real cares for imaginary joys. In the morning we worship life; at night

"Sleep, Death's twin brother, times our breath;

Sleep, Death's twin brother, knows not death."

CLINTON N. Y

Marketing Potatoes at Fairhope, Alabama

Fairhope, the Home of the Single Tax and the Referendum

By Ernest B. Gaston

SECRETARY OF THE FAIRHOPE INDUSTRIAL ASSOCIATION

UPON a gentle acclivity on the east shore of Mobile Bay, in Alabama, on a site well chosen for its natural beauty, lies the village of Fairhope. Industrious, energetic, embodying a novel experiment in new methods of dealing with vexing social problems, the community has more than justified the hopes of its friends and well wishers. It has confounded the arguments of those who maintained that the communal idea of land ownership cannot be carried out in the face of "natural laws" and in competition with private enterprise. It has demonstrated that a community organization

The Entrance to Fairhope. The Pier Shown in the Illustration is 1,800 Feet Long and Was Built by the Colonists

The Business Center of Fairhope, Showing the Public Water Works and the Principal Business Houses

can successfully act as a landlord. Tho no individual owns or can acquire a foot of soil in Fairhope, confidence, mutual interest and communal rewards have proved strongest of incentives. The return to the individual as a member of the community is greater than he could secure for himself under the old system of personal holdings. In every particular, other than that of individual tenure of the soil, the widest liberty prevails. The attainable minimum of restraint is put upon natural freedom of individual action. The fads, follies and tyrannies that have wrecked other attempts at communal life have been avoided—celibacy, religious restraints or qualifications, communism—none have entered into the plan of Fairhope. Within its borders the values which are created by the common effort go to all the citizens; no one can impose a burden upon another for the use of that which nature has given or the public effort has created.

Beginning in January, 1895, with five families of Iowans, in a pine forest on the eastern shore of the bay, 16 miles southeast of Mobile, Fairhope has now seventy-five families and is growing with accelerating speed. The five families comprising its first settlers hailed

from Des Moines. They subscribed—each—\$200 for a membership in the colony, with which a tract of land was purchased and deeded to the present landlord of the town, the "Fairhope Industrial Association." The association now owns 1,400 acres and is continually making fresh purchases. Forests have been cut down; land has been brought under cultivation; a water system has been put up; a wharf and a steamer have been built. Thrift, energy, enterprise, self-reliance and individual initiative are the conspicuous qualities that give tone to the community.

Any person, even tho he be indifferent or actually hostile to the central idea—single tax—may lease the land in Fairhope for 99 years on the same terms as one fully imbued with the principle. Rental valuations, determined annually by the "Executive Council," are subject to a referendum to the whole resident rent-paying membership, and approximate 5 per cent. of the estimated value, exclusive of all improvements. The best city lots, each one about one-fourth of an acre, can be had at \$1.60 to about \$15 each per annum. Outlying lots cost less. Farm lands are held as cheaply as 20 cents per acre, up to \$100

Typical Cottages of the Members of the Fairhope Community

annually. The rental charges represent the entire cost of holding lands in the colony, for State and county taxes are paid by the colony authorities out of the rent.

In 1903 the taxes will equal about one-third of the rentals. Even if the burden represented by the tariff and other national imposts, figured as being part of the tax burden of the colonists, were added to the State and county taxes, the total would not equal the rental value of the land as appraised by the members of the community. At Fairhope that portion of rent which elsewhere goes to private landlords is the community's earned increment, and is collected and expended for the community. In 1903 the rent paid by the settlers will be about \$1,000; the State and county taxes will be about \$400. The difference, amounting

to \$600, will go to the community in the form of public improvements. A water system is provided and water is free to all colonists. When lighting systems, street cars, telephones and all public utilities shall have been called into being the services will also be free. A part of the rent is used to supplement the meager public school fund yearly, giving Fairhope children nine months' free tuition, where other districts have from three to five. Two commodious bath houses have been erected and are free to settlers. One of the finest free libraries in the State of Alabama is also an accomplished fact.

It must not be imagined that all public utilities wait for the public funds. The heartiest co-operation in the public service is encouraged; to it is due the circumstance that the colony has not only wharf facilities but also direct steamship

Central Park, Fairhope

communication with Mobile. Both have been supplied under the "Guernsey Market House Plan," so-called from the Channel Island of the name where it was first applied. The colonists contributed money, services or materials; and the wharf, 1,800 feet long, was builded. In payment for work, cash or lumber, certificates were given to contributors. They bore no

ready earned a part of her cost, notwithstanding a 50 per cent. reduction in passenger rates and considerable reduction in freights. Eventually the steamer service may be free to the settlers, just as elevators are in office buildings.

Sentimental considerations have saved Fairhope considerable money on its "Guernsey Market Plan" of public

Community Settlers, Out for a Morning's Drive

interest; in lieu thereof a "bonus" in certificates was given at the outset, but they were receivable for all wharf services.

When the wharf had paid off its prime cost of \$1,200, as it did in four years, it became an important revenue producing property to the community; the earnings, like the land rents, go to the public funds. In 1902 the net earnings were over \$700. In 1903 they will be nearly \$1,000. The steamer "Fairhope," costing \$12,000, has al-

ready earned a part of her cost, notwithstanding a 50 per cent. reduction in passenger rates and considerable reduction in freights. Eventually the steamer service may be free to the settlers, just as elevators are in office buildings.

Sentimental considerations have saved Fairhope considerable money on its "Guernsey Market Plan" of public

works. Many of the holders of certificates did not present them for redemption; they kept them instead as souvenirs. Some of the canceled certificates have been used as ornaments; and a lecturer recently sold a number during a trip to the North. They now adorn the walls of homes in Philadelphia and other cities.

The community is governed entirely by the Initiative and Referendum and the Imperative Mandate. Ten per cent. of the members of the association may

demand a general vote upon any question affecting the interests of the community, and the trustees are bound to call an election for the purpose. Whether the question be the revocation of some order of the Executive Council or the retention of an official, a simple majority prevails. The purchase of a membership brings in both husband and wife to equal voting rights. Children of members have to acquire voting rights on the same terms as their parents.

Officers have, in a few instances, been displaced by the operation of the Imperative Mandate and the Referendum, and official acts have, sometimes been disapproved; but, as a general rule, officers have been prompt to recognize and accede to the general wish.

An important institution is the Progressive League. It meets every Sunday afternoon and listens usually to a speech on some social or economic topic, announced beforehand on the big blackboard which is set in the center of the town. Democracy obtains in argument as well as in management.

Every one is given a hearing—for ten minutes. All visitors to the town, provided they are in any way acquainted with social or economic questions, are invited to address the gatherings. In no place can the catholic character of the settlement be more quickly and fully felt. The widest differences of opinion, which appear in the Sunday discussions, are rather encouraged than rebuffed. The Fairhope theory of government means the minimum of restraint consistent with any order at all; the widest possible growth and difference of view; the fullest play to the opinions of man, woman or child. Fairhope people occasionally find they have a guest who desires to exploit some impossible or long exploded theories; they give a more than ordinarily respectful hearing to him, or to the rabid anti-single tax man, for the sake of the rule which admits both them and the others who may come bringing rich fruits of intellect and experience.

Dances, literary and musical entertainments, socials, picnics and excursions in the colony steamer are of fre-

Members of the Fairhope Community Bathing

The Beach at Fairhope

quent occurrence. The higher life of the community is in charge of two church organizations, a parish of the "Christian" or "Disciple" communion and one Congregational body. Clergymen visiting the town are invited to speak on religious topics whenever occasion offers.

Broad as are the intellectual and social opportunities, they by no means exhaust all that Fairhope enjoys. The whole eastern shore of the bay is lined with a series of summer resorts of which Fairhope is one of the most popular. Northern people, in rapidly increasing numbers, are also coming hither as to a place of winter rest. The result is that the shore is seldom without delightful visitors. The "seasons" are about eight months long—for there is a winter and a summer season—and owners of cottages have a double set of renters. Bathing on the superb stretch of shelving, hard beach is possible for two-thirds of the year, and merry parties may be seen far out, like little specks afloat, on April 1st and on December 1st. The tide is ordinarily but two feet, and undertow is unknown. Deep water is a thousand feet out, over hard, white sand bottom, and bathing conditions are as nearly perfect as the most fastidious or timorous could desire.

It may be to such wholly favoring, inviting conditions that the steady growth of the community is attributable. Or, again, the reason is to be found in the low premium that has been put upon the admission of newcomers to the full advantages of the colony. New members are accepted upon payment of \$100, instead of the \$200 paid by the founders. The money is expended in the purchase of more land. Members must be in sympathy with the views of Henry George as to land values and taxation; but no such qualification is demanded of mere renters of the soil. Half of the residents of the colony are not believers in the single tax theory; some of them are directly opposed to it.

Fairhope at large has been found to bear unexpected testimony for the single tax. When it was founded many adherents of Henry George disapproved and actually discouraged the colony idea. They feared that the success which would attend the colony if properly conducted would tempt antagonistic interests to buy up surrounding lands and, by preventing sales to colonists, smother out the enterprise, and so afford what superficial observers would regard as a failure of the single tax in practice. The result as seen

to-day shows a contrary tendency.

"Are you looking for land?" said a well dressed man, in the winter of 1901, to a visitor who had just alighted from the steamer at Fairhope.

"Well, I might buy some; what have you?"

"Excellent lot, right here by the edge of the colony. I want \$10 an acre for it."

"Is that a fair price?" asked the supposed newcomer.

"It's dirt cheap. Land at Silver Hill, ten miles back, is being sold at \$15 to \$20, but I will sell you, right here, for \$10 an acre. The fact is, I hate the very name of colony. I want to sell out and get away from this one," he added with a burst of anger. "If I sold my land for nothing, this Fairhope gang would offer bigger inducements." And the seller sighed.

The newcomer did not disclose his character as an ardent Henry George man; he looked about, verified the would-be seller's statements, and appears to have been the first to observe the fact that the single tax, in the form there presented, had made an end of the land boomer. To-day the land the speculator offered at \$10 is held at \$3, and there are no takers. Silver Hill, altho tributary to Fairhope, holds its land now above the price quoted in 1901.

If the end of the land speculator be indeed come every one else has profited, if one may judge by the experiences of those who desire to use Fairhope's opportunities. The intending settler in the community can acquire a life interest in all the land he desires at a low rental, with all the material advantages of the community and freedom from taxation included. If he make improvements he has only his improvements to sell, should he desire to remove. There is no land interest to be destroyed; nothing to be bought at "slaughter sale" from the man who is suddenly called away. The improvements are always saleable, generally at a price a little below their actual cost. In practice it has been found that the price realized for them is nearer their value than in the case of ordinary sales. It is the advantage of their greater

negotiability; and their greater negotiability is brought about by the fact that improvements alone need be considered by the succeeding purchaser.

Compactness of settlement, which is but another name for the complete and normal use of land, is actually to be seen at Fairhope. Scarcely any vacant lots gape between houses in the village. The taking, for public use, of the full annual value of the sites discourages the holding of lands for mere speculation. Fairhope will never present the spectacle, so familiar in the West, of miles upon miles of "city lots" offered at fabulous prices; of curbs and streets cut through prairies and forests; or a "city" of 10,000 people, with an incorporated area sufficient to house ten times the number. Nor will it ever experience the bursting of a "land boom," by which thousands of people are ruined and millions of dollars are lost in the inevitable turn of the tide; nor will its people ever starve for the food that might be grown on "city lots" kept idle because of the progress or failure of a "boom." It has been said that in Seattle, Tacoma, Portland and Spokane Falls, with an aggregate population of some 450,000, there are "city lots" which, if all built up, would be sufficient to house the populations of London, Paris, Berlin and Vienna. What the speculations mean, of ruin to thousands, will never be known—would scarcely be credited if told.

Fairhope has made more rapid strides than any of the other settlements on the Eastern shore of Mobile Bay. It has been found that residents of surrounding towns will go out of their way to use its facilities. Its "back country" stretches out like a fan, while, to use a figure of plain trigonometry, the country tributary to other towns, on a thickly settled bay shore, might be compared to a rectangle. Much of it is due, it is true, to the fact that the boat service to Mobile is direct; for, organized by the public spirit of the colony for its own use, the service does not stop at other shore towns, as does the service the steamer "Fairhope" supplemented, thus making a great saving in time as well as charges—advantages to be credited

directly to the energy and enterprise which spring up under healthful economic conditions. The use of nature's opportunities in the soil are open, on equal terms, to all who seek and use them. Fairhope's competitors, with which comparison is made, have all the adventitious aid of Northern skill, push and enterprise; its record has been made under the most exacting competition. Indeed, it has been a case of "Greek meeting Greek."

Nearly all the residents of Fairhope are from the North. Iowa contributed the first settlers; Ohio, Illinois, Indiana, Pennsylvania and the New England States gave quotas; and one late accession included a number of persons from a Henry George coterie in Holland, who first settled in Paterson, N. J.

Few experiences have given such comfort to the adherents of the single tax as Fairhope. It has done all, and more than all, that was prophesied as the inevitable outcome of equal opportunity in land. Yet everything is not yet told; few great discoveries or ideas yield at once the full measure of their

beneficence. The discovery that speculation was to fly defeated before even a limited experience, carried out in the midst of an indifferent people and with local tax laws all unfavorable, was altogether unexpected. It points to the time when holders of adjoining lands will freely give their holdings to the colony in return for the advantages of the association.

It holds now options on 2,500 acres of land adjoining that of the Fairhope settlement. The price ranges from \$1.25 to \$5 per acre. Its quality and its situation are such that it would sell readily at prices varying from \$15 to \$50 per acre, if Fairhope were in the hands of land speculators instead of those of a community whose salvation lies in the principles its members profess. It is land adapted to a wide range of products, profitable both for home consumption and for shipment to Northern markets. There is a confident assurance that the community within the next two years will close by purchase in fee simple its option on the entire 2,500 acres.

The Steamer "Fairhope," which the Colonists Built and Launched with Their Own Hands. The Steamer Communicates with Mobile

FAIRHOPE, ALA

Wanted, a New Patriotism

By Ernest Crosby

AUTHOR OF "PLAIN TALK IN PSALM AND PARABLE," "CAPTAIN JINKS, HERO," ETC.

WHEN a few weeks ago President Roosevelt came in sight of the Pacific Ocean, after his trip across the continent, in an outburst of patriotic pride at the extent and prosperity of the country he cried out: "What a splendid place for a big navy!" or words to that effect. It seemed to me a curious expression of patriotism. For those who think of fleets only as they ap-

pear when they pass in review there may be nothing shocking in the thought, but when we consider the ultimate object of men-of-war and picture to ourselves the hundreds of brother men writhing in agony, maimed, drowned, roasted and boiled, as the war correspondents at Santiago described them, it seems a pity that one of the most beautiful views in the world should call forth the prophecy of

such scenes, and this, too, on the shores of the *Pacific*, of all oceans! It reminded me of a young medical student who told me that he could never see a pretty girl without wondering how she would look if she were dissected. This may be called the sanguinary point of view, and I cannot but think that it is abnormal. Pretty girls should not suggest dissecting knives nor should noble scenery call up a vision of battle-ships and torpedo-boats.

Incidentally I might remark that we have a number of seas on our northern boundary which to the eye of the tourist look as wide as the Pacific and upon which, if I am not mistaken, not a single gun-boat is allowed. We have had the good sense to agree with our Canadian neighbors that no costly instruments for mutual mutilation and slaughter shall be permitted on the Great Lakes, and the happy towns on their banks pursue their peaceful and absorbing avocations without a thought of foreign attack, and I am not aware that they do it at the loss of any manhood or self-respect. In the light of this example Mr. Roosevelt might better have exclaimed at the Golden Gate, "What a fine place for the nations to disarm!"

Why is it that the popular ideas of patriotism are thus hopelessly entangled with war, so that expressions of the kind reported crop up on the most peaceful occasions? We must, I think, look for the explanation to heredity. We are advancing slowly and painfully from barbarism to civilization, and we are yet very far from being civilized. War was at one time the chief concern of our ancestors, and all the useful pursuits of life were subordinated to it. Every issue was fought out on the physical plane, and men as yet denied the supreme place to intellect in the affairs of the world. We are only beginning to learn that might is not right, that my greater strength does not prove my juster claim, and that to settle differences between nations by war is as unreasonable as to decide disputes between individuals by wager of battle or the test of hot irons. We are passing from the plane of brute force to the plane of reason, and the higher history of mankind is the history not of wars but of ideas.

In some respects our immediate ancestors seem to have understood this better than we do, if we are to judge them by this festival of theirs of the Fourth of July. Various days might have been selected on which to commemorate the Revolution, and I fear that if the choice had been left to our so-called "patriotic societies" they would never have thought of the Fourth of July. The average "son" or "daughter" of the Revolution appears to think that the only element which entered into that great movement was the element of fight. They put up bronze tablets wherever two or three were gathered together to pomel each other, but the conception that any ethical idea lay beneath these conflicts rarely, if ever, enters their heads. Yet it is very clear that if wars can ever be justified at all (which at the present time I altogether doubt), it must be by the moral ideas which inspire them. Our fathers apparently saw this. They had not risen above the plane of war, but they had insight sufficient to see that the essence of the Revolution was not war but a principle, and they determined to celebrate not the battle of Bunker Hill nor the surrender at Yorktown but the Declaration of Independence. That document is one of the highest moral import. The idea that every man is entitled to life, liberty and the pursuit of happiness is one of the noblest of abstract truths, and among the more concrete none is more momentous than this, that government from outside and across sea is iniquitous. This is, indeed, the very kernel of anti-imperialism, and the Declaration of Independence is its *Magna Charta*. The Fourth of July used to be called Independence Day, but that name has fallen into disuse, and we might well substitute for it the name of "Anti-Imperialist Day." The greatness of the Revolution lay in the discovery or adoption of these ideas of the Declaration and in the resolute maintenance of them. The fighting was merely incidental, and, indeed, it was rather disgraceful than otherwise, for it is disgraceful for men to be reduced to killing each other for the purpose of establishing a self-evident truth, and the less fuss made about it afterward the better.

When it came to be a question of com-

memorating the Civil War, how differently we went about it! If we had followed the example of our ancestors we would have picked out some event which embodied the ethical content of the war, such, for instance, as the signing of the Emancipation Proclamation, but, instead of that, we have instituted "Decoration" or "Memorial" Day, which recalls nothing but carnage, and is so far removed from any ethical conception of the war that it is celebrated with equal gusto by both sides. If we conclude to honor our Philippine War by a holiday, it will be difficult indeed to find any moral incident to perpetuate. We might keep the day on which General Smith issued his famous "boys over ten" proclamation for the pacification of Samar, or that on which General Funston did not swim the Rio Grande. The future, however, may have better things in store and we may yet live to observe the anniversary of the re-establishment of the Filipino Republic and the voluntary evacuation of the army of benevolent assimilation and the water-cure—an event worthy of its Fourth of July.

For the purpose of assuring yourself of the true character of Memorial Day, imagine yourself visiting a family of strangers. You find them engaged in a family festival and you ask the meaning of it. "Oh," they answer, "this is the anniversary of the big fight between Tom and Jim." "What!" you cry; "do you mean to say that Tom and Jim, who are sitting so peacefully next to each other at table there, ever had a big fight? Why, I should think you would wish to forget it." "But, my dear sir," they reply; "you can't understand what real love of family is. They nearly killed each other and we wouldn't forget it for anything in the world." "An odd family," you might remark to yourself, "but not unlike some nations I know of."

Now love of family is a smaller kind of patriotism, and love of country should

be guided and animated by the same principles that prompt the other love. A man may be quite ready to defend his family in case of emergency without allowing his mind to dwell continually upon that chance and perpetually preparing for it. He may love his wife and children dearly, but he does not go about with a chip on his shoulder, saying, "My wife is handsomer than your wife and my children are better than your children," nor does he set up batteries along his neighbor's line fence and then pretend to be on good terms with him. The idea of love of family presents to the mind a picture of mutual consideration and helpfulness without a hint of odious comparisons or of intolerance for or hatred of others; for love of family blossoms in kindness to all, while our current pinchbeck patriotism bristles with bad manners. Genuine patriotism should have all of these good qualities of family love, and in the same proportions, for a nation is only a huge family. The association of love of country with soldiers and brass bands and armed cruisers and contempt for foreigners is a relic of savagery. The idea of massacring our neighbors should be resolutely pushed into the background, as it is in family life, except in Kentucky and Servia, and eventually we may be able to topple it over even off the background and into the bottomless pit.

Evolution is continually transforming the stock ideas of the race. It has disposed of gladiatorial combats and crucifixion, of the rack and thumb-screw, of capital punishment for theft, of imprisonment for debt, and of slavery. In the same way it will before long consign the old blood-and-thunder style of patriotism to the rubbish-heap. But, fear not, a new patriotism will rise up in its stead, a patriotism of affection and ideas, involving devotion to all that is best in our country and a determination to make her better.

RHINEBECK, N. Y.

The Story of Two Moonshiners

[In the city of Atlanta, Georgia, there are a couple who are nearly middle aged and live, in fair comfort, upon the income of the husband's small but independent business. As it happened—in what manner it is needless now to tell—the fact was learned that, some few years ago, they lived in Eastern Tennessee. And, as it happened also—by what means it is impossible now to tell—the fact was learned that, during their residence there in Tennessee, they brewed and sold whisky which bore no revenue stamps. Some urging was required to induce the wife, a woman of education, to prepare a brief account of their experiences and observations. So far from the making of any endeavor to have her deal with the squalid romances of the dangerous trade, especial stress was laid upon the desirability of explaining, by preference, its commonplaces and its prose. But it would seem that criminality cannot escape dangers; and so both aspects of the "moonshiner's" recurrently hazardous career appear in the narrative, which is printed as it was received.—EDITOR.]

OUR first step in the direction of lawlessness came when the doctor said my husband's life depended upon an immediate and permanent change of climate. Frank, who was born in Philadelphia and had lived there always, feebly suggested that the Quaker City was a pretty good health resort; but the doctor declared it would not do at all, and the sooner he located in some mountain district, the better it would be for him. We considered all sorts of places, but the South seemed to be the most promising. The merits of Florida, Tennessee and North Carolina were canvassed; the question was finally determined in favor of Tennessee. Frank was fortunate enough to obtain employment at his trade in one of the towns of East Tennessee and his wages were sufficient to enable him to fulfil the parting injunction of the doctor, which was that he live on the mountain side. He was able to do a great deal of work at home and thus got his fill of good mountain air. The effect was immediate. He improved from the first week. But the lonesomeness of it was something dreadful to contemplate.

Homesickness is comparable with nothing in the world except some forfeited affection. We were both in the cruelest stage of depression when we became acquainted with a tall, lank mountaineer, who sat on our porch in the evening and beguiled the long summer hours with a flow of anecdote, story and philosophy such as I have rarely heard. He frankly told us that he was a moonshiner, because moonshining was more congenial and more profitable than any other work he could undertake. Several times Frank, without giving serious

thought to what he was doing, helped him to dispose of his product.

We lived on in this fashion for a year, when Frank lost his position by reason of a shut-down in the factory. It made him despondent, but he did his best to put on a brave face.

"My health is fine now," he said. "If we go back to Philadelphia I can get a good position right away."

"But, Frank," I exclaimed, with an anguish I could not conceal, "the doctor is sure you cannot live six months in the Northern climate."

He turned away without a word, and we moped the remainder of the day, two very miserable beings.

It is curious how slight circumstances can change the current of a person's life. That night we had our usual visitor in the person of the lean, lank mountaineer. Beneath his originality and quaintness there was a native shrewdness; it did not take him long to see that something was wrong in our little household. He was so kind, so friendly, that I told him the whole story. When I concluded he sat there, chewing tobacco, his lantern-like jaws working up and down with the precision and regularity of a piece of machinery, while their owner was thinking very hard but never saying a word.

At the end of five minutes he unlimbered his gaunt form, rose, and called Frank into the other room. They talked very earnestly for half an hour. When they came out they were smiling, and Frank's face was flushed a bit. The next day Frank became a moonshiner—yes, that is what it was. It all seemed so strange, and yet so natural. I, who had the advantage of good parentage and the benefits of a seminary education, never,

by the wildest stretch of the imagination, dreamt that I would be the wife of a breaker of the law.

Our little frame cottage, which was on a ledge half way up the mountain, was immediately utilized for business purposes. It seemed a desecration to condemn it to such base uses. Silvery streams threaded the valley below and cascades of water sped on their way to picturesque gulches.

Some few hundred feet in front of the house there was a disreputable-looking road with a score of scraggy trees, tottering and trembling as if in mortal fear of the awful abyss below. Many a time have I wandered, lonesome, along the tortuous highway when all nature seemed filled with the pity of autumn. It wound round and round the side of the mountain like a circular stair. From my window I could see, here and there, a vine clinging from some crevice, where the wind had cast the seed, flaunting the fading remnant of a diseased and paralyzed life. The ragged tramp of a road crept along, clinging to the side of cliffs, whose walls were scarred by the ages. Along the ravine below a brook was fleeing madly, as tho fearful to remain longer in the unbroken solitude, in which it seemed to be the only living thing.

Frank had learned the full meaning of the fact that the Government exacted a tax of \$1.10 for every gallon of whisky distilled in the United States; he was already mentally calculating the profits to be derived from the business. Our house was painted white, with green shutters. We had yellow shades and lace curtains on the windows, and altogether it presented the appearance of a very respectable and very tidy abode. Now, where do you suppose Frank put his distilling outfit? *Why, in the parlor of that house.* I remonstrated at first; but, as I had yielded to his resolve for the business, I could not object to precautions for our safety. The still was a copper boiler upon two rows of bricks. That part of the floor was covered with sheet iron. In the corner of the room was an old-fashioned parlor organ, standing rather high, and so arranged that it could be used as a complete cover for the distilling plant. Our greatest difficulty was with the glass tubes that caught the fumes, which be-

came mist and melted out in the form of whisky or mountain dew. The apparatus was finally so planned that it could be quickly separated from the remainder of the plant and hidden in the interior of an old hair-cloth sofa. A lead pipe ran from the still to the tub in a bathroom built on the first floor, and this was used as a means for disposing of the refuse. As a precaution the lead pipe was built under the floor.

To me it was the observance of the law or the death of my husband. I had made my choice. I was a full partner in the concern, and I threw conscience to the winds.

Our product was small but sure. We used corn, chiefly, and the whisky was afterward sweetened with molasses or rye flavoring. At first my husband carried it to town in big jugs and disposed of it to men who were willing to take the always dangerous chances. As time went on he became bolder and shipped it away by the barrel in the guise of potatoes. The tops and bottoms of the barrels were filled with real "spuds," grown in our little garden, and the tops were covered with burlap. This is the common form of handling contraband whisky. Many a barrel, shipped to prohibition towns, is carefully made up to resemble rolls of carpet. I have known some moonshiners to mark on the outside of the packages "Use no hooks," and "Handle with care." In certain sections of New Jersey and Maryland the "wet goods" are shipped in the guise of oysters. We used corn in the making of the whisky, but I am told that certain shrewd Yankees in Vermont have, in emergencies, made it of prunes, raisins, pears, apricots and similar fruits.

From this time on I noticed a gradual deterioration in my husband's moral character, and—I write it shamefacedly—I fear that I shared in the transformation. We became more and more like those most abject of all creatures—the poor whites of the Southern mountain districts. We were very healthy, but not quite happy. Corn meal was the staple food. Nature was generous in many ways. We had mountain trout and wild fowl in abundance. Our truck patch supplied all of the vegetables we needed. Fresh meat was unknown and bacon

rather a luxury. Our neighbors lived about as well as we did, except that they sold many of the things we reserved for our own table.

There were half a dozen stills in operation in this district. None of the people were our equals in education or breeding. They were genuine mountaineers—phlegmatic, unfeeling, dull. But between us there existed a sort of rude free-masonry, by which the interests of one were made the concern of all. Other residents of the mountain, while law-abiding, were in silent sympathy with us. There is a widespread feeling that the laws which interfere with a man who wants to manufacture a few gallons of whisky are essentially wrong, and that he has the same inherent right to run a still as he has to maintain a cider press or to grow potatoes.

Many of the men who persistently violate the Internal Revenue laws are church-goers and they lead moral lives. They lie to shield themselves, but do not regard the offense as any very grievous sin.

"Was it not proven in court, over at Asheville, that you swore to a lie?" was asked of a man in a North Carolina State Court.

"W-a-al," said he, "s'pos'n I did. Wasn't that in the United States Court?"

While Frank was out one day he was led into an altercation with a neighbor. He came home worried.

"You should not fret over such a trifle," I said. "You do not fear the man, do you?"

"Not physically," he said. "But he may put the revenue officers on us."

His apprehensions were verified. About dusk one evening we were startled by the sharp report of a rifle three times in succession. It was the neighbors' signal that the revenue men were about. We quickly removed all traces of the business. The organ was placed over the still; the glass worm and the other paraphernalia were hidden in the old sofa. I took my place on the organ stool and began playing an old-fashioned hymn. Frank sat on the sofa, directly over the evidences of crime, with a hymn-book in his hand, singing in

a very excellent baritone voice. Our parlor door was unlocked.

The two government officials, without knocking, bolted in, pistols in hand. The scene seemed to embarrass them. Both pocketed their revolvers and instinctively took off their hats. The deputy marshal, who was one of your genuine Southern gentlemen, said:

"I fear, madam, we have made a mistake."

I pretended to be indignant, exclaiming:

"I should say you have!"

"A thousand pardons," he begged, bowing again. "But in the excess of our zeal we have come into the wrong place."

He said he had received an anonymous letter stating that a still was in operation in our house. The deputy raiding collector joined the marshal in trying to explain their "error." In a little while we were the best of friends. Nothing would do but that we go on with our interrupted song. They joined in the chorus. I set them out some cold lunch in the dining-room. They left in time to reach town before midnight. As the sound of the horses' hoofs died away in the distance we regarded each other with a look of intense relief.

We agreed that we could not afford to risk another adventure of that kind, and the next morning the plant was removed from the house and placed in a cave about a mile away. It was ideal for the purpose. It had been carefully dug out and was covered with logs and dirt and leaves thrown over the logs. A spring of mountain water—so essential to the successful work—ran near by waiting to be utilized. The natural advantages of the situation were manifest.

Many persons formed the habit of coming to us for a jug of whisky, but we never did any direct business with them. If they were put on the witness-stand under oath they could not swear we were violating the law. The jug was placed near the stump of a tree—with the money. The customer took a stroll and, on returning, found the money had gone, to be, in some strange manner, replaced by the whisky. Another method that worked very well was to sell a half peck

of apples or potatoes for a dollar and throw in a jug full of whisky as a present. The presents were not reserved for holidays, but were freely dispensed at all seasons of the year. They had the effect of making us quite popular in the neighborhood and incidentally helped to fatten the account which we were beginning to keep in a savings fund.

Various attempts were made to entrap us. One day a young fellow, nattily dressed, came into the neighborhood and said he was there to introduce a new style sewing machine. A neighbor, four miles below us, got the bead on him and gave him just five minutes to leave the neighborhood. He admitted that he was a raw revenue officer, and he departed with his life and without ceremony. Again, a colored barber, enlisted in the government service, came hanging about the mountain-side. He paid a girl guide the "location fee" of ten dollars and found himself in the very heart of the moonshine district. Such vain things as shaves, hair cuts and shampoos were unknown in our simple *entourage*. The colored tonsorial artist was escorted out of the district on a sharp fence rail, with the intimation that, if he ever returned, he would be tarred and feathered. One of our neighbors—to be exact, the very man who induced us to go into the business—was caught in the act of distilling whisky. His lawyer told him his case was hopeless; he promptly dismissed the lawyer. When the case was called he confessed his guilt, but—shaking like a leaf—said he was making the liquor in order to use it for his chills and fever. The tender-hearted judge was impressed and the prisoner left the court-room a free man.

In another case a young mountain girl made a fearful sacrifice to save her lover from the penitentiary. He had been arrested for moonshining, and the chief witness against him was a woman of notorious character, whose last name chanced to be the same as that of the sweetheart. The witness was spirited away. When her name was called the sweetheart took the stand and testified that she knew nothing of the guilt of the young man and had never known him to violate the law. The commissioner, who knew the real witness by sight, detected

the fraud. Turning to the girl in the witness box, he said:

"Are you the person for whom the subpoena was intended?"

She was filled with confusion. She had come to protect her lover by concealing the truth, but she had no thought of committing so revolting a perjury. It was a terrible ordeal. She would have to confess the truth or carry out the lie. She chose quickly. Hanging her head, she replied:

"I am."

The commissioner was relentless. He continued, sharply:

"Then you are also the person who was convicted of stealing two years ago?"

Her embarrassment and shame were intense, but she answered in a low voice:

"I am."

The commissioner determined to make her drink the cup to the dregs. In scathing tones he demanded:

"Then, of course, you are the same person whose loose morals have created so much scandal in this community?"

In a voice that was scarcely audible she whispered:

"I am the same."

She was led, half fainting, from the stand, and the mountaineer was freed. The case has now become historic and it can be found in the records of the United States Courts in Tennessee.

Frank's first and only experience of a real battle with government officials was as a spectator. He was away, on the other side of the mountain, when a force of ten mounted deputy internal revenue raiders rode up. They asked for information regarding a notorious moonshiner, which Frank naturally refused to give.

They rode straight on to their destination, a big log house behind a clump of trees. They knocked at the door, but were refused admittance. The door was promptly battered down. As it fell inward two women, screaming hysterically, ran out, and the men in the house, all equipped with rifles, began firing at the raiders. One deputy was killed and one wounded. Two mountain men were killed; the rest were captured, tried and convicted.

The story of that bloody encounter

horrified me, and, I think, it had a sobering effect on Frank. I knew from that moment that I should never be happy until we quit the business. My task was to wean him from it. That I succeeded—not in a day or a month—is evidenced by the fact that I have now, not without some reluctance, consented to place an imperfect story of our experiences upon record. The life had its fascination and

its profits; but it also had its drawbacks, not the least of which was an uneasy conscience and the constant dread of meeting the officers of the law. I look back on it as a troubled dream, but also with a pleasant, indulgent and charitable feeling toward the rough, kind-hearted, but misguided, mountaineers of East Tennessee.

ATLANTA, GA.

A Novelty in Fishing Clubs

By William E. Meehan

FISH COMMISSIONER OF PENNSYLVANIA

[The story of the liver fed trout is an old one—old as the days of the restaurant and the fish company which rears fish for the table, without regard to the interests of sport or the rights of self-respecting fishes. As Mr. Meehan very vigorously says, a large number of the trout streams have been pre-empted in the cause of the dollar of profit, or of the angler of exclusive habits. The article which follows tells of a radical departure in fishing clubs, with two great merits conspicuous in the plan—one that trade is subordinated to sport, and the other that whoever will may fish for trout in its waters, from the sybarite who comes in special train to that poor Walton *redivivus* whose most precious possession is an old, true rod and his book of flies.—EDITOR.]

SCIENTIFIC angling for trout has made a wonderful growth in popular favor. It is estimated that where there was one sportsman who used the artificial fly almost exclusively twenty-five or thirty years ago, there are now a hundred. But there has not been a corresponding increase in the number of streams that yield satisfactory results, or that may be fished at will during the legal open season. There has been, indeed, a decrease, to such an extent as to excite widespread comment and much dissatisfaction.

Many streams have been fished out, and others yield scarcely more than moderate returns—and then only as the result of heavy and persistent stocking with fish, reared in Government or private hatcheries, within the last twenty years. Other and potent agencies have operated to still further decrease the number of streams available for the bulk of the rapidly increasing army of anglers.

A quarter of a century ago the great majority of mountain creeks were free to any one who chose to fish them, and a large proportion of brooks flowing through cultivated lands could also be

fished without serious objection from the owners, or on the payment of a small fee. With few exceptions, the anglers of to-day have no such freedom. They find themselves in an era of fishing clubs and private fish preserves. For several years individuals or corporations have been leasing or purchasing the best trout streams for their own exclusive enjoyment and that of their immediate friends or for wholly commercial purposes. The general public is rigidly excluded. It is reported that there are now relatively few free trout waters within a comparatively reasonable distance of any large city or town east of the Mississippi Valley.

The closing of the best trout streams to the public is the chief cause of the general dissatisfaction that exists among anglers. Some, who profess to speak with authority, declare that it is more difficult for an individual, not affiliated with an angling club, to secure a day's good trout fishing in the mountain streams of Pike and Monroe counties in Pennsylvania than in the rigidly preserved waters of England and Scotland.

It is an undeniable fact that in the cultivated portions of these counties, and

even in the vast stretches of unbroken forests, most of the streams are closed to the public. It is impossible to go into the wildest spots without being frequently confronted with notices tacked to trees, warning people not to fish under penalty of the law. Pike and Monroe counties have become the principal home of fishing clubs and fish preserves.

Pennsylvania has long been a Mecca for fishermen from many States, because of the singular beauty of its streams, and its attractive wilderness. For this reason, not a few devotees of the rod and reel regard the advent of fishing clubs and fish preserves as almost a national calamity. The Legislature of the State has been aroused to the desirability of taking some action that will, at least, preserve a few trout waters, outside those in the Forest Reserves, for the general public. At its last session a law was enacted making it an offense, punishable with a fine, to apply for, or to be concerned in applying to the State for, any fish, to be planted in waters in which the public is not allowed to fish. The Legislature passed another and even more stringent act, declaring that hereafter, whenever any owner of a stream applied for fish to be planted, the stream should be considered as free and open and the public could never be debarred from the fishing privilege. It is to the credit of the clubs and preserves now in existence that not one opposed the enactment of the measures, and at least two assisted in working for the entire fish bill of which they were a part.

A corporation recently organized in Monroe County may be looked upon with more favor than such organizations generally are, since one of its principal aims is to furnish sport for those who cannot afford, or are unable, to become members of one of the many concerns owning or leasing streams. Its incorporated title, the "Paradise Valley Trout Company," smacks of commercialism; but its aims are not wholly sordid. Indeed, it appears highly philanthropic in its plans. Incidentally, its promoters hope there will be substantial financial returns; but, primarily, it is intended to provide sport for the members of the world of fishermen. A corporation that proposes to foster sport first and regards

profit as a mere incident may be considered as a decided novelty—as something almost unique in fishing clubs.

The officers are all keen sportsmen, and more than one are widely known among the angling fraternity. The President is Charles Robinson, a former sheriff of Scranton; the Secretary is J. B. Williams, of Stroudsburg; the Treasurer, W. C. Henry, of Henryville, and the General Manager, Nathan R. Buller, of Paradise Valley. Mr. Buller is naturally the man on whom rests most of the burden of bringing the novel enterprise to a successful outcome. His name is familiar in many States as a fish culturist of skill. He served his apprenticeship under the Pennsylvania Fish Commission, and he is the foster father of many hundred million brook trout, now swimming in the waters of innumerable streams in the Middle and New England States.

The home of the new fishing club is in one of the most picturesque spots in Monroe County. It occupies a generous acreage of meadow land in a sequestered region known as Paradise Valley, not far from a quaint little village of the same name. Surrounding it are the jumbled mountains of the Blue Ridge. Paradise Creek flows among a tangle of trees down the valley and through the land of the club; but the main reliance of the organization is on several huge springs, from which many thousand gallons of ice cold water bubble every minute.

As the concern is but a few months old only a small fraction of its plans have been completed. It may be a year or two before everything will be in readiness for the angling world. A hatching house has been erected, with a capacity of over 10,000,000 trout eggs every year, out of which fully 9,000,000 little fish may be expected to wriggle, tail first, to encounter the many trials and dangers which fish life is heir to. To accommodate them 28 nursery pools, each 40 feet long by 10 wide and a little more than a foot deep, have been constructed. As soon as the fish become two years old they are to be transferred to 18 pools, each 200 feet long, 30 feet wide and 2 feet deep.

At the age of two a brook trout, if it

has been well fed, is large enough to be angled for, and so these 18 pools will be devoted to fishing, with the exception of a few that are to be set apart exclusively for breeding purposes. But the pools are not the waters on which fishermen will cast most longing eyes. At the lower end of the property are two pretty artificial lakes, each covering over two acres. In the lakes are to be placed all the large trout—fish that have passed the age of three years without having been brought to destruction through a blind overconfidence in their ability to distinguish between a natural and an artificial insect. The trout in the two lakes are expected to weigh from one and a half to four pounds each, and to be from 15 inches to two feet long. Presumably, also, they are to be sufficiently abundant to make it reasonably certain, if the angler wishes, to catch the full limit of fifty, which the Pennsylvania law allows a rod each day.

As a rule, anglers who whip streams for wild fish do not care to cast flies on artificial ponds and to catch cultivated trout. The latter are usually quite tame, and when hooked do not make a very vigorous fight. A two-pound cultivated trout will rarely struggle more than two or three minutes, and does little save swim around with the hook in its jaw, without resorting to any of the tricks of his wild relatives. Nor is a cultivated trout regarded by epicures as possessing the delicacy of the wild fish. It is usually fed on cut liver, and the taste of the meat is plainly evident in the flesh. Prominent among those who do not care for catching cultivated trout, or for eating them afterward, are the officers of the club and many of its members. Yet they expect to fish in the new preserve.

They do not intend to have the trout fed on liver, and they do not propose to

allow them to become tame. They are to be fighting, game trout, as good as wild, which will yield a sport as keen to the man who wields the rod and artificial fly. Natural food alone is to be provided. Some of it is to be brought long distances, and all forms are to be those the fish themselves seek in the streams.

It is the decision to adopt this policy that has removed the concern almost entirely out of the class of those who cultivate trout primarily for profit, with sport as an incident only. Fresh water shrimp, grasshoppers and little fish are to be the chief foods. Perhaps also, on occasions, the trout may be regaled with maggots, bred from meat placed at a remote spot on the preserves.

These are some of the attractions offered by the newly organized club. In its waters the whole world may fish on exactly the same terms as the members. Here again is a novelty in fishing clubs, and one that many will probably be quick to appreciate. The laws of the State must be strictly observed and each person who fishes must also pay for the fish that is caught. They are the only restrictions. They do not seem unreasonable; and, in fact, they are not nearly so unreasonable as is the owner of a trout stream who insists on an angler first paying a sum down before a hook is cast in the water, and who returns not a cent if no fish be caught.

The aims of the organization are praiseworthy, and the force of its example may be felt in all parts of the country. It may lead to the establishment of others, and the adoption of a more liberal policy by the many clubs and fish preserves that now rigidly exclude all but members and their immediate friends from their holdings.

PHILADELPHIA, PA.

Memory

By Grace Goodwin

I START and listen as of old,
In watching hours at night,
To hear a little wailing voice
That cries aloud for fright.

The silence is alive with sound;
Across a waste of years,
I bend my face to touch her cheek,
And kiss my baby's tears.

PAWTUCKET, R. I.

LITERATURE

American Literature

PROFESSOR TRENT has given us the best history of American Literature yet written.* His volume does not perhaps make such entertaining reading as Professor Wendell's, but this is due to the plan of the work and not to any dullness on the part of the writer. His tone, too, is quite free from those peculiarities which made Professor Wendell's book not altogether pleasant to contemplate. Professor Trent shows on every page that he has really read the literature he is criticising, and this can scarcely be said of any previous historian, with the exception of Tyler, whose volumes, veritable models in their kind, carry us down only to the revolutionary period. Nor is this commendation as light as it might seem. To labor through the vast mass of books which, by courtesy, are called American Literature, so as conscientiously to estimate the value of these forgotten writers and make sure that no piece of real merit has escaped the eye, to weigh and compare so many imponderable virtues—is no holiday task. With the exception of the few names whom everybody knows American literature is indeed a wilderness of mediocrity. That Professor Trent has really made a careful survey of this enormous waste material is evident both from his original estimate of insignificant works and from little remarks made by the way which could have come only from first-hand knowledge. Thus he observes casually of Dwight's "Conquest of Canaan" that "in few epics do morning and evening strolls taken by the hero and heroine play such an important part as in this Connecticut pastor's, who may have been unconsciously influenced by the free, pleasant intercourse of the Yankee youths and maidens about him."

The judgment shown by Professor Trent is as marked as his industry. One feels everywhere that the critic is estimating each work by that canon of tradi-

tional criticism which is not so easy to apply as might be supposed. Indeed if one were inclined to find fault, it would be because this judicial poise of the critic passes at times into something perilously close to commonplace. Occasionally there is a bit of incisive writing that tells—such as this criticism of Walt Whitman:

"With regard to Whitman's style in general we may be equally brief. He seems to be as much the victim of jargon as of cant. His catalogs, his trailing lines, his blundering foreign locutions, are as little spontaneous, as little appropriate to his purposes and subjects, as any mannerisms known to students of pedantic epochs. They are scarcely signs of decadence, as we have seen, nor are they to be set down as mere affectations. They are far more probably effects of an inborn want of art, of a combination of overearnestness and underculture. It is worth noting, however, that they seem to produce on some readers a sort of hypnotic effect."

That is somewhat sharper than the author's habit and is a decided relief. Of philosophic criticism in the broader sense of the word, of real insight into the significance of such writers as Emerson and Hawthorne, we get little. It would, indeed, hardly have been in place in such a manual as this. Of what Professor Trent attempted—a sound estimate of purely literary values on conventional lines—we have an admirable example, and such a work is much needed for a number of reasons.

Occasionally Professor Trent shows signs of hasty characterization. Morbidity is a favorite word with him and is generally well applied; but that hardly seems to us a trait of Woolman's Journal. Indeed the distinguishing mark of Woolman is just his absolute healthiness where other men would have been morbid. And again, to call Walt Whitman "strikingly Hellenic" is to abuse a much abused word unpardonably. Whitman as a writer was everything that is un-Hellenic. But such lapses as these are extremely rare. A more serious fault springs from the great excellence of the book. Professor Trent knows his sub-

* A HISTORY OF AMERICAN LITERATURE By William P. Trent. New York: D. Appleton & Co. \$1.40 net.

ject so well that he does not remember how ignorant others may be. Thus he gives an excellent criticism of Trumbull's "McFingal," but he does not recollect that not one of his readers in a hundred will have seen that mock heroic poem. A clear account of what the poem really is would seem to have been the first desideratum. Errors of this kind are pretty frequent, unfortunately.

More serious—indeed the only serious blot on the work—is an error of tone which we may assume to be the one most of all deprecated by Professor Trent. The common characteristic of histories of American Literature is provinciality, and in striving to avoid this fault Professor Trent has quite too frequently fallen into it through his very overzealousness. A few quotations will make this point clear:

"They were proud of him (C. B. Brown), and rightly, and it is hypercritical for their descendents to patronize either him or them."

"But this is not to say that he (Cooper) deserves the sneers or the patronage of the persons who turn him over to their boys."

"But with all his limitations, he (Bryant) was a genuine and admirable American product of whom contemporary countrymen might well be proud."

"No sympathetic student of Thoreau's life and works will find anything that needs evasion or humiliating apology."

There is the point. Professor Trent shows constant uneasiness because there is too much on his path that "needs evasion or humiliating apology." His estimate of the value of American Literature is on the whole sound, but this tone of constant comparison might better have been avoided.

Experimental Criticism

SAINTE-BEUVE has warned us somewhere to be very careful how we father our own ingenuities upon the classics. And it might be sufficient criticism of Professor Moulton's book* to remark that it is very doubtful whether Shakespeare ever had anything so formidable as a system, if the Professor had not taken pains to explain that what he means by Shakespeare's moral system is simply his own view of the ethics of the

Shakespearean drama. Now there is a decided advantage about this position: for just as a man may be a good man tho no poet, it is conceivable that a man may be an excellent moralist without having a very reliable critical method. And so when Professor Moulton begins in his preface by throwing overboard "the current schemes of plot analysis" because they are "no more than adaptations of Aristotle's principles to new matter" and "are thus survivals of the Renaissance criticism;" when he declares that Greek drama and Shakespearean drama stand "at opposite poles of dramatic structure," because the former "rests upon the severe simplicity of the unities;" and furthermore when he boasts of adapting for Shakespeare's plays "a method of dramatic analysis which allows dramatic movement to fall into the second place, while the chief prominence is given to the multiplication of stories, which is the essence of the Romantic Drama"—then, indeed, the intelligent reader will see little reason to congratulate himself on the critical outlook and will probably turn his attention elsewhere.

After these instances of his critical sagacity it is not astonishing to find Professor Moulton developing as the basis of his work Zola's exploded theory of the Experimental Novel.

"At another time, in what he calls experiments, the physicist creates; he contrives, at his arbitrary will, peculiar combinations, which would not be brought into existence but for him, and obedient nature exhibits what her working would do under these conditions. In a similar way poetry and fiction are an experimental side to the philosophy of human life. History, biography, psychology, ethics, correspond to the physicist's mere observation of nature; these studies limit the material they use to what happens to have happened. Poetry and fiction use the same material of human life without limiting it to what has chanced actually to occur; all that would naturally happen in the conditions contrived makes the material of creative literature, which can thus give to its treatment of human life all the range of crucial experiment."

If this is not *le Roman experimental* to a dot, without the pretense of scientific erudition, what is it?

Now it takes, or it used to take, a very small stock of critical acumen indeed to

* THE MORAL SYSTEM OF SHAKESPEARE. By Richard G. Moulton. New York: The Macmillan Co. \$1.50.

understand that fiction, prose or poetry, has absolutely no experimental value whatever and that truth in the sense of actuality is about as impertinent to fiction as anything well can be. If we, for instance, are writing a novel which includes a boy among its characters, it makes little difference whether our "psychology of adolescence" be correct or not, provided only we get a sense of boyhood which is true to the general sentiment—that is, provided we catch the way in which the object is reflected in human consciousness. To sociology, to science it does make a tremendous difference; but to literature not a whit. The Greeks knew this, Shakespeare knew it; and knowing it, they made great literature and never worried themselves about the thousand impertinences that trouble us.

But Professor Moulton goes farther than Zola Zola was, after all, a writer obliged by his own formula to the observation of life. Professor Moulton as a student is tempted to extend the principle to the study of literature instead of the study of life. If literature is a set of organized experiments, then the moral sciences, psychology, sociology, ethics, ought to turn from that "eddy whirl of unrelated particulars" which constitutes life to those "'images' of human things cleared from the vagueness of too great distance or the obscurity caused by irrelevant details" which constitute literature. It is hardly necessary to point out the fallacy here or the ambiguity involved in the use of the word "image"—hardly necessary even, it is so obvious, to point out the *cul de sac* into which Professor Moulton and many another, who can see no particular difference between literature and life, would lead us if they had their way.

In spite, however, of the canker in the bud, Professor Moulton, it is only fair to say, does not write three hundred and fifty pages without a number of acute and illuminating remarks. And we regret that, confined as we have been to the analysis of an error which seems to us fundamental, we are able to give them no more than this passing notice. He has notably in several instances brought out the underly *motif* or moral significance of a play more clearly than is customary.

The Jewish Encyclopedia

VOLUME follows volume of this great *Jewish Encyclopedia** at a rate which proves the diligence of the editors and the courage of the publishers. Volume IV ends with "Dreyfus," which makes us fear that, without more compression, it will not be possible to conclude the work in the promised twelve volumes. We can give it almost unlimited praise, if we except the liberality with which the names of living Jews of some distinction are included. Thus, under the name "Cohn" are mentioned eight or ten physicians and college professors in Germany and America, some now scarce forty years old. But this illustrates the general fullness of the work. It is of much value to the Christian as well as the Jewish scholar, especially as it presents points of view that would not naturally occur to one not versed in Hebrew lore. Under "Christianity" Dr. Kohler gives a sympathetic but very critical account of the life and work of Jesus and Paul. According to him the stories in the Gospels are to a considerable extent haggadic, but Jesus was a Jew who did a noble work in his sympathy with and defense of the common man unversed in the intricacies of the law. Under purely Old Testament titles we often have two or more writers, of whom one perhaps gives a careful *résumé* of the biblical data, while another gives the more critical view. The light from Oriental discoveries is not neglected, and appears in many articles, of which "Cherub" and "Dagon" are examples. Under the latter title Dr. König—for there are many Christian writers—holds that Dagon was a fish-god, and not a corn-god, and that the Assyrian pictures of figures with a fish body and a human head, or of a human form clad in a fish skin, and with the fish head worn like a helmet, are really Dagon, a view which might be combated, altho held by many students. These figures need study and differentiation and relation to the Babylonian water gods. Very interesting are

* THE JEWISH ENCYCLOPEDIA. A Descriptive Record of the History, Religion, Literature and Customs of the Jewish People from the Earliest Times to the Present Day. Prepared by more than Four Hundred Scholars and Specialists. Complete in twelve volumes. Embellished with more than two thousand illustrations. Vol. 4. New York: Funk & Wagnall's. \$6.00.

the articles "Didache" and "Didascalía," which labor to show how much these famous Christian lesson books for catechumens, etc., depend on similar treatises for instruction in the synagogues. Indeed, throughout there is a freshness of view which makes this Encyclopedia a valuable complement to the best of our Bible Dictionaries, altho there is not a little that seems addressed to the subscription department, such as the accounts of various towns and cities, and, we may add, of diseases which are not specially Jewish, but on which Jewish physicians have written monographs. The article on the Dreyfus case is long and very admirable; nothing better can be had. The author is a French public man who does not allow his name to be given. Of course, and rightly, he makes Dreyfus the victim of abominable slanders and forgeries. Some of the illustrations are colored, and they are well selected and illuminating. The work is important for public libraries and will give distinction to Jewish private libraries.

The Ward of King Canute

"THE Thrall of Leif the Lucky" is said to have been "the most beautiful book of fiction published in 1902," but the author's recent novel, *The Ward of King Canute*,* is an equally attractive volume and a better story. The scenes are laid in England during the last years of the tenth century when Canute, with his Danish host, invaded the island and conquered the Angles.

This period presents some difficult features to the romantic interpreter, but Miss Liljencrantz meets them with fine discrimination. It was an age when there were riches and profligacy without the sense of refinement or luxury. Yet a rude splendor of colors set off the savage simplicity of character. Every man wore a red cloak or a green tunic, every woman was a "painted lady." And there was barbaric insolence in the contrast between this flamboyant pronunciation of personality and the grim fortress and camp life of the times.

But even when the historical novel-

ist is correct in his impressions, he fails as a rule to conceive clearly enough the characters and conditions with which he deals for the reader to accept the illusion. He tells of wars and wonders so remote that he himself is no longer able to realize them in living terms. No one objects to the fierce extravagance of emotion imputed to the men nor to the superlative charm of the women, but we resent the fault that these incredible qualities are not so portrayed as to seem credible. And the fact that Miss Liljencrantz has succeeded in this most difficult undertaking will make her story a rare treat to lovers of the historical romance.

The question is not how far she is justified in the representations made of the savage impetuosity of her heroes, the important thing to know is that she has so recreated the times and conditions from which they sprung that the passions and excesses of her characters are not only logical, but are essential. That a young maiden should parade for months as a King's page and even as a soldier on the field of battle is an absurdity to the modern mind. But when we consider that in medieval times women had the spirit and endurance which made them the mothers of a race of warriors, yet were according to custom defenseless against the romantic license of half savage men, it is not so incredible that a virtuous high-born maiden, suddenly orphaned, should take refuge in the valiant guise of a man. At least in this instance the role is not only made to appear possible, but the result is such a charming mixture of boyish candor and feminine perversity that we are not likely to forget the lovely and gallant "Randalin," womanly in her tenderness and even in her fears, but manly in her courage.

Turkey's Lost Provinces

MR. WM. E. CURTIS, for whom his publishers make the claim that he has written more newspaper columns than any other man in the world, has given us a timely book, *The Turk and His Lost Provinces*.* This is a companion

* THE WARD OF KING CANUTE. By Ottilie A. Liljencrantz. Chicago: A. C. McClurg & Co. \$1.50.

* THE TURK AND HIS LOST PROVINCES, GREECE, BULGARIA, SERBIA, BOSNIA By William Eleroy Curtis. New York: Fleming H. Revell Co. \$2.00 net.

of "The Capitals of Spanish America," "The Yankees of the East," "The Land of the Nihilist," "To-day in France and Germany,"—all from the pen of Mr. Curtis, who peeps into a country and then "writes it up" quite as well as could be expected under the circumstances.

Bulgaria, Servia, Bosnia and Greece are the provinces in question. They are pictured in their present day aspect and have especial interest in view of the events that are now going on in them. Mr. Curtis swept through the land as the correspondent of the *Chicago Record-Herald*, and the new book is the result of his impressions.

The most interesting and surprising chapters are those which concern Bosnia. Austria, according to Mr. Curtis, is giving Bosnia a model paternal government, which is in the nature of a startling surprise to a people just escaped from the yoke of Turkey.

"One who visits the country to-day can scarcely believe that such conditions could have existed only a short time ago, the people are so contented and prosperous," says Mr. Curtis, speaking of the dreadful anarchy and crime that filled Bosnia when Austrian rule began.

"Crime is almost unknown. Railroads reach every corner of the province, and the freight houses are fed by long caravans of carts hauled over excellent highways."

The cities have all been rebuilt. Education is free and general. The murders and robberies which were very common have practically stopped. In 1900 there were only two murders in a population of 2,000,000, and in six years there was only one case of highway robbery.

Bosnia is the sunny spot of the Balkan lands, according to this book. Servia, Bulgaria and Greece have no such comfortable present or hopeful future. Bulgaria is filled with brigands and political agitators who strive for the liberation of Macedonia by such means as the kidnapping of Miss Stone (who, the author informs us, is determined to return to Macedonia to be kidnapped again); Servia (he writes before the recent revolution and assassination) is in the hands of a bad woman and a degenerate son of ex-King Milan—who gained notoriety as the worst man in Europe,

and Greece shows no signs of a new intellectual awakening. Mr. Curtis thus sums up the modern Greek of the working class: "He needs whitewash, chloride of lime and carbolic acid."

Democratic freedom with the Greeks, says Mr. Curtis, has run into license. The peasant thinks that he is as good as anybody, and asserts himself unpleasantly. Homicide, too, is very common.

The Master of Millions. By George C. Lorimer. New York: Fleming H. Revell Co., \$1.50.

Downey Macgillivray is a Scotch youth who, wrongfully accused of a crime, is induced to escape instead of standing trial. He takes ship for Australia, is wrecked, rescued and landed in South Africa, where he discovers untold wealth and whence he later makes his way to Australia. Nearly fifty years after his shipwreck he returns to England, an eccentric and woebegone Cræsus, determined to find the love of his youth, Angelica, and to clear his reputation from stain. Through a vast and intricate web of episodes the tale proceeds. A comprehensive drama of life is attempted, and all the crimes and all the virtues are exemplified in the various characters. The wonderful longevity of all the chief personages is a notable feature, and almost as notable is the wealth of unusual incident that happens in each one's life. It should be said that the sentiments and moral reflections enunciated by the author in his own person and in that of all his characters except the villains are invariably what a minister's should be—unexceptionable.

Old Squire. By B. K. Benson. New York: The Macmillan Co., \$1.50.

A frankly told tale of the Civil War with a devoted negro slave for chief protagonist. There are spirit and heart in the pages of this "Romance of a Black Virginian" and a cordial sympathy throughout that leave a tender memory behind. A pretty thread of a heart interest weaves in and out of the sterner stuff of the book, but the real love story is that of Old Squire for his adored "Mahs Chahley," and it is here that one's eyes grow moist and one's throat

tight, for the pathos is true pathos and the tragedy unforced and sincere.

The Grey Cloak. By Harold MacGrath. Indianapolis: The Bobbs-Merrill Co., \$1.50.

The usual seventeenth century romance, that begins mysteriously in Paris and progresses from one duel to another across sea and into the Canadian forests. The author frankly challenges criticism with the admission that it is a story written "to entertain." And unquestionably it is as good bloody-minded bombast and as interesting as that class of fiction, of which "The Helmet of Navarre" was the original literary pattern, usually is. But one thing is certain, the hero who manages by the dexterity of his sword arm to live through one of these historical romances is sure to be disfigured for life. Ever after he is put together apparently with the red seams of battle.

The Modern Obstacle. By Alice Duer Miller. New York: Charles Scribner's Sons, \$1.50

The "modern obstacle" here referred to is the lack of wealth where it is a question of marriage between impecunious members of that sacred set known as the socially "elect." And the story is an effort to explain and prove why poverty is unendurable to this particular class. At the same time the author has cast her reflections in a dramatic form that is sure to entertain as well as to illustrate her point of view. The heroine is really a poor woman, bred, however, to demand that harmony of life which she thinks only wealth can insure. Thus, altho she loves him, she refuses to marry the hero because he has only \$6,500. Upon an income so small she reasons that happiness is impossible. The psychic effects of practicing mean economies and probably "smelling her own cooking" would be so degrading to the exquisite quality of her love that she declines to risk the profanation involved in such a marriage. But when the rejected lover learns that she is about to marry a rich man he meets the romantic emergency of this high class situation in a manner that reflects credit upon his ingenuity. With a check in his pocket for

the whole amount of his capital and with the avowal that he has only six months to live, he again lays his heart at her feet. Convinced that they can live half a year upon \$6,500 without the vulgarity of economy, she accepts him. And the fact that the sequel does not turn out exactly as she expected is not her fault.

The Siege of Youth. By Frances Charles. Boston: Little, Brown & Co., \$1.50

The plan of this book—for it has, properly speaking, no plot—is of the simplest; the development of the love-instinct and various other small matters, in three immature (they are not to be called in the true sense of the word young) couples, working out into three mild and unexciting pairings-off such as point no particular moral nor adorn this particular tale. The charm of the book, for it has a charm, lies in its piquant contrast of masculine style and feminine point of view. Moreover, the writer has thoughts—real thoughts—as to life in general and conduct in particular which are quite worth perusing.

The Under Dog. By F. Hopkinson Smith. New York: Scribner's, \$1.50.

An apt title is an excellent thing in books, and Mr. Smith has hit upon a particularly graphic one to cover his latest collection of short stories. The first three sketches—grouped under the general heading, "No Respector of Persons"—it must be confessed strike the reader as belonging to that class of art which, as Stevenson expresses it, "may be best described as a brutal assault on the feelings," since they "wallow naked in the pathetic," or, to be quite accurate, in the tragic, depicting the grievous experiences of certain poor, innocent-minded mountain whites in Kentucky who have fallen under the displeasure of an indiscriminating and insular court. When one considers them in cool blood (as one is hardly able to do immediately after reading) one perceives that these life-studies present but one side of a very complex case—viz., that of the law versus the individual, and that while here the brief is made out solely for the individual, there is certainly something to

be said on the side of the law. The rest of the tales are told in their author's characteristically clever and sprightly fashion, and present the under dog in various aspects—grave, gay, guileless and *game*—but always entertaining.

Literary Notes

"THE First and Second Books of Esdras," edited by Archibald Duff, form a new number of the Dent-Lippincott Bible.

.... "Hereward the Wake," in two volumes, is added to J. F. Taylor & Co.'s excellent Library Edition of Charles Kingsley.

.... The Cumulative Index Company now issues in a convenient volume a reprint in one alphabet of their quarterly issues for 1899. We have thus in handy form for reference a catalog by authors and titles of all the principal magazine articles of that year. They propose to issue similar volumes for the remaining years up to date (The Cumulative Index Company, Cleveland, Ohio.)

.... "The Witchery of Sleep," by Willard Moyer, is a book somewhat unique in its kind. After a few chapters on sleep and sleeping places comes a selection of quotations on the subject brought together from a fairly wide range of reading. It is decidedly interesting to compare the verses on this universal topic from the various poets. The book also contains a number of full page illustrations of famous beds, etc. (New York: Ostermoor & Co., \$2.00.)

.... The tenth volume of "The New International Encyclopædia" contains words from *Infantry* to *Larramendi*. Some of the illustrations in this volume, as for instance the colored plates of insects and plants, are a useful addition to the text. Other illustrations seem to have been inserted merely to catch the popular taste. It does not seem clear, for example, how a full-page scene from "The River Jordan" which might represent almost any river in the world, really increases the value of a cyclopedia.

.... W. E. Henley, well known as a poet and as a trenchant uncompromising critic, died, July 12th, at his residence at Woking. Mr. Henley was only fifty-four years old, and was in his usual health until a fortnight before his death. He was at one time a collaborator with Stevenson, and his criticism of Stevenson, not long since, raised a storm of protest. One of his stanzas is much quoted:

"It matters not how strait the gate,
How charged with punishments the scroll,
I am the Master of my Fate,
I am the Captain of my Soul."

Pebbles

THERE was once a maiden named Clare,
Who kept a fat rat in her hair,
But her pet, a small cat,
Did tackle that rat,
And the poor girl now uses pumped air.
—*University of Pennsylvania Punch Bowl*.

.... On the day that President Roosevelt arrived in Topeka triplets were born to a mother in Chanute and also to a mother in Humboldt. Kansas doesn't profess to go deeply into sociological problems such as the President's theory of race suicide, but she always strives to please.—*Kansas City Journal*.

.... He told his son to milk the cows, feed the horses, slop the pigs, hunt the eggs, feed the calves, catch the colt and put him in the stable, cut some wood, split some kindlings for morning, stir the cream, put fresh water in the creamery after supper, and be sure and study his lessons before he went to bed. Then he went to the Farmers' Club to discuss the question, "How to Keep Boys on the Farm."—*Country Life in America*.

.... Now that newspaper prize competitions are in order, we desire to keep in fashion by offering a magnificent prize to the novelist who is most successful in self-advertising. Any aspirant who will cut out this paragraph and send it to us with three cents and a statement of his method of advertising himself will receive, postage free, a copy of the next issue of the very best daily in America, which modesty forbids us to name. In order that the rank and file of our novelists may not regard their chances as hopeless, we expressly bar from the competition Thomas Hall Caine and Marie Corelli in England, and Thomas Dixon, Jr., and Harold MacGrath in the United States. With these formidable competitors out of the way, there is a fair opportunity for every able-bodied novelist now working at the trade. We regard it as only just to put Mr. Caine and Miss Corelli out of the running, for Mr. Caine himself admits that he is the greatest living novelist; and Miss Corelli stands quite as high in the opinion of those who have never read the writings of any one else. Mr. Dixon's anecdotes about himself and his children are so much more numerous than those about other great men that he may fairly be suspected of employing an assistant; and Mr. MacGrath's tales about the sources of his plots, his methods of composition and his gift of repartee are so unconvincing that they are commonly supposed to be a continuation of his efforts at fiction. Now is the time to enter this great educational competition, which is indorsed by Sunny Jim, the Mayor of Spotless Town, Charles Frohman and President Roosevelt.—*New York Evening Post*.

EDITORIALS

For Civilization at Evansville

THIS midnight battle of militia and mob in the second city of Indiana should cause every American citizen to consider solemnly the problem now presented by such disorder, and to determine what his duty is. He should ask himself what he ought to do, and how his influence can best be exerted, to check and suppress the rapid and menacing growth of the mob spirit. This growth, in its most dangerous aspect, has been the work of only a few years. It is true that for assaults upon white women it has been customary during many years past to lynch negroes in the South; but we need to go back only a short time to find the first burning of a negro at the stake. Since that first of a series of dreadful and barbarous events there have been seen a steadily increasing contempt for the due process of law, a growing desire on the part of lynchers and burners for that publicity which at first was avoided, greater complacency on the part of public officers who have permitted prisoners to be taken from their custody by mobs, and an ever lengthening list of the offenses for which lynching is by many regarded as a fitting punishment.

One lynching begets another; brutality and torture in one town suggest similar exhibitions of barbarity elsewhere; if to rape is added homicide or even theft as a sufficient cause for lynching, in one State, the same offenses are added to the lyncher's list in another; and the infamous inactivity of public officers where the most shocking torture has been openly and defiantly inflicted serves to encourage torturers and to restrain the authorities in other places.

The mob in Evansville had been stimulated to its excesses by the refusal of the authorities to prosecute well known citizens who recently burned a negro school teacher at the stake, for homicide, in Belleville, Ill. The offenses of Wyatt, in Belleville, and of Brown, in Evansville, were of a similar character. In neither case were the lynchers able to offer as an excuse for their acts the

crime that was formerly almost the only warrant for the lynching of negroes. In neither city was there any reason to expect a failure of justice; these offenders would have been punished surely and speedily by the courts of Illinois and Indiana. But in Evansville the mob, when it was dispersed by the guns of the militia, was no longer striving to punish a prisoner held for so serious a crime as homicide or murder; it had set out to kill, and possibly to burn at the stake, sixteen negroes, some of whom had been imprisoned for nothing more than petty theft.

To this extreme of lawlessness and folly had the mob spirit brought a large number of the residents of Evansville. Fortunately they were checked by citizen soldiers who did not shrink from doing their duty, soldiers who had the support of a civilized and fearless Governor, even if they could not look to their local civil authorities for such encouragement as they deserved. Not their action, but the necessity for it, is to be deplored. Their shots were fired not only in defense of the negro prisoners and of themselves, but also in defense of American civilization and liberty, whose sure foundations are law and the just enforcement of it. They are not responsible for shedding the blood and taking the lives of both the guilty and the innocent. Blame for that rests upon the local authorities who had paltered with the rioters, permitting them for days to revel in violence with impunity. It must rest also upon the inhabitants and officers of many other towns where such mobs have been allowed to work their will, committing crimes that would disgrace a savage and for which the nation is ashamed.

Mob violence has been checked in Evansville, but we must not assume that the disease has been overcome and will disappear because that which is the only remedy for a virulent manifestation of it has been administered once in Indiana. It is widespread and deep-seated. While the prevalence of it is due mainly to race hatred in the South (and elsewhere, in less degree), it has had other causes.

Whenever crimes of violence have been committed by groups of men, and have gone unpunished, this dangerous spirit of contempt or disregard for the agencies which civilization has chosen for the preservation of order and liberty has been encouraged and stimulated.

How unnecessary and superfluous it seems, at first thought, to argue in the United States that the law should be observed and honored, and that mob rule and organized defiance of laws and courts are injurious and should be prevented at any cost! The record of events shows, however, that the time has come when argument in support of such truths, which should be accepted by every American who is not an imbecile or a rascal, is required in the interest of public safety.

Those who give due weight to the experience of mankind and have learned the lessons taught by every contest for human liberty should strive to enlighten others who have been misled—to convince them that whatever may be the crime for which a mob seeks to inflict punishment, mob violence in such a country as this, especially if it escapes the lawful penalty, is always a crime more to be abhorred and infinitely more dangerous. To those who thoughtlessly or ignorantly say that the life of a prisoner is of so little value that it ought not to be preserved at the cost of the blood or lives of men who attack a jail in which the prisoner is confined, it should be shown that defense of a prisoner so hunted is defense not only of an accused man, but also of the institutions and liberties of the Republic. Law-abiding citizens are safe and free only under a reign of law.

The unchecked activity of a mob inevitably releases for the injury of the public that evil element of the population in every city and town that is ordinarily restrained by fear of the law, and the successful repression of which is a proof of civilization. In the brief history of this vigorous attempt to preserve the advantages of civilization at Evansville there are texts for innumerable discourses against mob rule. By no means the least forcible of them are to be found in the sharp telegram sent to a weak judge by Governor Durbin. The true

spirit of American liberty and justice is found in every word of that message.

The New Physics and Old Problems

THE remarks of Lord Kelvin in moving a vote of thanks to the Rev. Professor Henslow for his address on "Present Day Rationalism," in a course of Christian Apologetics given by the Christian Association of University College, London, has started a discussion which for the number of distinguished men who have contributed to it and the importance and variety of the issues involved is one of the most interesting which has occurred in many years. When an Englishman is excited about anything his first impulse is to write to the *Times*, and when once a controversy is started John Bull never lets go.

The particular words of Lord Kelvin which excited the most controversy are, as he has revised them for publication, that while a

"fortuitous concourse of atoms is not an inappropriate description of formation of a crystal, it is utterly absurd in respect to the coming into existence, or the growth, or the continuation of the molecular combinations presented by living things. Here scientific thought is compelled to accept the idea of a creative power. Forty years ago I asked Liebig, walking somewhere in the country, if he believed that the grass and the flowers which we saw around us grew by mere chemical forces. He answered, 'No, no more than I could believe that a book of botany describing them could grow by mere chemical forces.' . . . Every action of free will is a miracle to physical and chemical and mathematical science."

Evidently words could hardly have been chosen more apt to excite a storm from all quarters, and some of the criticisms on this utterance are worth noting. Sir Thistleton-Dyer, director of Kew Gardens, says:

"Lord Kelvin wipes out by a stroke of his pen the position won for us by Darwin," and holds that "the argument from design applies as much to a diamond as to a caterpillar," and quotes Lord Kelvin's own words before the British Association in 1871: "If a probable solution [for every problem], consistent with the ordinary course of nature, can be found,

we must not invoke an abnormal act of creative power."

Karl Pearson objects to using a secular university for

"an anti-Darwinian crusade which does not proceed from the inspiration of science, but from a mistaken notion that man can *a priori* assert what method of conducting the universe is or is not consonant with the divine dignity."

Prof. E. Ray Lankester, the great zoologist, holds that

"there is no relation between science and religion. There is, it is true, often an antagonistic relation between exponents of science and exponents of religion when the latter misrepresent or deny the conclusions of scientific research or try to prevent its being carried on; or, again, when the former presume, by magnifying the extremely limited conclusions of science, to deal in a destructive spirit with the existence of those beliefs and hopes which are called 'religion.' Setting aside such excusable and purely personal collisions between the rival claimants for authority and power, it appears to me that science proceeds on its part without any contact with religion, and that religion has not in its essential qualities anything to hope for, or to fear from, science. . . . Lord Kelvin seems to have formed the conception of a creator who first of all, without care or foresight, has produced what we call matter with its necessary properties, and allowed it to aggregate and crystallize, . . . and then, as a second effort, has brought some of these elements together with 'creative and directive purpose,' mixing them, as it were, with 'a vital principle' so as to form living things. . . . It is not obvious what value this curious conception of intermittent creative power and purpose can be to religion."

Sir Oliver Lodge and many others are, according to the latest news from the seat of war, hotly discussing whether directive purpose and free will are or are not violations of the laws of conservation of matter, of momentum and of energy, Professor Lodge holding that

"it is possible for live things to affect the motion of matter in an unpredictable and capricious manner, though always in accordance with laws of motion."

On the question of who originated the phrase "the fortuitous concourse of atoms," Cicero or Democritus, the debate has brought in the advisability of abolishing the compulsory entrance examination in Greek at Oxford. The question of the propriety of religious lectures in

a secular university has led to the discussion of the attitude of the Non-conformist toward the new education law. So far as we have observed Chamberlain's tariff proposals have not been brought into the controversy, but doubtless will be in connection with the subject of free will as the conflict ramifies through the reviews.

This discussion is an interesting illustration of the difference between English and American journalism. If an American Kelvin—altho we have no American Kelvin—should have made a few remarks of this sort no daily paper would have printed them, except perhaps in the joke column, and it would not have been subjected to the searching criticism of diverse and competent minds. In America subjects are not threshed out, and the wheat and the chaff go together, with few to distinguish between them.

We have given these quotations because they are not accessible to some of our readers, and it is necessary to know how these old problems are viewed by prominent men of science at the present day. On account of the haphazard nature of the discussion it will probably not result in any important conclusion, but it shows that the time has come for the earnest consideration of the old philosophical and theological problems in the light of the newer conceptions of science. The discoveries in physics, chemistry and biology of the last few years have been so great that the old formulas and ideas in these sciences appear quite inadequate. Only three years ago Professor Haeckel published his Confession of Lack of Faith, and attempted to solve the "Riddle of the Universe" by the use of one key, the laws of the conservation of matter and energy. Now in the fact that radium continues to give off energy without any apparent source of supply we have what seems at first sight to be a violation of the law of the conservation of energy, and Professor Ostwald, one of the foremost authorities on physical chemistry, does not hesitate to declare the law of the conservation of weight in chemical processes is proved to be incorrect by the recent experiments of H. Landolt. Some of the younger school of chemists laugh at the atomic theory, and some of our newer psychologies make

little mention of the will, free or otherwise. But the old problems of human life and thought reappear in new language, and the demand of the times comes for such solutions as man can give of them to be rewritten in another form. This year the Bridgewater fund trustees wind up the affairs of their seventy-five years' administration, and the eight volumes "On the Power, Wisdom and Goodness of God as Manifested in Creation" gather dust undisturbed in our theological libraries. But the theme remains and it is the duty of each generation to treat it in its own phraseology and according to its own forms of thought.

Ravaging the World

IF Chaucer and Shakespeare could come back from "sweet Jerusalem" to look once more upon "this troublous world," it would not be any new longing "to gone on pilgrimages" or any new play in the comedy of human life that would most deeply move their spirits. Love, jealousy and hate, ambition and revenge continue to move figures on the stage as from the beginning of time. As in those fresh morning days of English song the thoughtless and the gay, the grave and the sad move on in companies and throngs through the highways and the byways of travel, pilgrims to every shrine, and enjoying one another as they go. In none of these matters has man changed. But the world itself on which those poets looked is no longer the same. Many of the fairest scenes which they loved have disappeared forever. They lasted until a little more than a century ago. Since then man has expended his energies in ravaging the world.

There remain in England and on the Continent fragments of natural forest and well-kept parks, in which here and there survive trees that a Druid might have loved, centuries old. Diminishing rivers still flow to the sea, but not through forest glades or wide reaches of unspoiled meadows, as when the legends of Merlin and of Robin Hood, of troubadour and minnesinger lingered, where screaming locomotives or the wires of telegraphs and telephones now carry the latest sensation of the hour. The great forests are gone; every beautiful valley

bristles with mills and chimney stacks. The brooks of sweet waters are no longer sweet, but, tortured into unnatural courses, they serve to bear away the dyes and scum of "industry." The most romantic river of the world, the Rhine, flows as of old between beetling crags, wild and castle-crowned, and glorious vineyards stretch along the lower levels of its banks. But the money-maker has found its forest wealth, its clays and building stones, its mineral springs. Brick chimneys belch bituminous smoke before the traveler's gaze as his eye seeks the Seven Mountains, or the Drachenfels, or Rolandseck, while everywhere vast scars in what was once the picturesque mountainside show the work of the quarryman's drill.

In our own country the devastation has been even greater, and it is now going on at a rate which threatens to leave little of natural beauty at the end of the twentieth century. To the eyes of our children an oak or a pine more than one hundred years old will be an infrequent sight, and that too in a continent which, less than twenty-five years ago, still abounded in remnants of the forest primeval. On the Pacific Coast the great sequoias, older than the western civilization of Europe, are falling before the ruthless money-lust of the lumberman. The wide free plains of the Rocky Mountain slopes will never again see the herds of bison, or even the wide ranging cattle of less than a generation since. They are inclosed in barbed wire fences and reduced well nigh to the tameness of suburban lots. Niagara itself will soon be only a mill dam, making dollars for men who nominally have souls, but who would turn them into securities to draw checks on if they could.

A hundred years ago Europe and America abounded in almost infinitely varied forms of wild animal life, and especially of birds. Here and there remnants of big game may still be found. But many a species have become extinct within a century, and many more will have passed away within the lifetime of men not yet old. That this planet is soon to be a birdless world seems almost inevitable. The senseless slaughter has been slightly, if at all, checked by the protests of those who realize what material damage, as well as loss of joy and

beauty, is threatened. To a man with a milliner's mind the life of a bird is a small matter.

Practically all of this ravaging of the world has been done and is being done by men who have no scruples about ways and means where money making is concerned. It is easy to say that man requires the materials which are being obtained by this appalling destruction of life and beauty. No stupider lie could be framed. The natural life and beauty of the world are being destroyed far less to satisfy man's real needs than by recklessly wasteful methods of production. It is not using too strong language to say that the day will come in America when our descendants will find no language bitter enough to word the cursings of their hearts upon the lumberman of to-day. There is not a lumberman in the United States who does not well know that he is making money by methods which are without economic or moral excuse. The men who blasted the Palisades opposite New York probably would not deny that in a well regulated community men should go to State's prison for making money in that way. Every wholesale milliner who instructs his simpering salesgirls to say that breasts and aigrettes are imitations made from the feathers of barnyard fowls not only is a liar, but also, in the classic language of the lamented Horace Greeley, he knows that he is a liar.

And so, year by year, the world is being ravaged. Beauty is nothing. Money is everything. Truly said the keenest reader of the human heart, "the love of money is the root of all evil." There is nothing so mean, so perverse, so remorseless, so insane that the money-maker will not do it without wincing. He will go on devastating the world until he has reached the limits which nature has set to his lust. When all the forests have been felled, and all the green lanes have been forgotten—when the ancient cliffs have become quarry holes, and the daisy-covered fields have been turned into brick yards, the "double infinity of sea and sky" will yet remain. The sunset cloud will glow with beauty, and the combing wave will break with resistless power. Man, the ruthless—man, the money-maker, will never despoil them.

For, thank heaven, they at least are beyond his senseless grasp.

Summer Schools

It has gradually come into the apprehension of our people that summer is a good time for study. The bias toward nature study compels us to prosecute part of it during those months when the trees are blossoming and the insects are at work. The summer has proved to be especially essential for all schools of biology. It is over thirty years since Harvard and Yale professors began to take part of their students to the Rocky Mountains and sections of the arid West for summer study. The seaside laboratory on Penikese Island was announced by Professor Agassiz in the winter of 1872. He proposed a program of instruction in natural history, to be delivered by the seaside at Nantucket, during the summer months, "chiefly designed for teachers who proposed to introduce the study into their schools, and for students preparing to become teachers." This was the initial step, and it was a grand one. Emerson used to speak of "our grandest man, Professor Agassiz." The school at Penikese was made possible by the generosity of John Anderson, of New York. It was opened in 1873 with forty-three students. Fortunately Agassiz was profoundly inspired with the thought of nature as a moral conception, "interpenetrated by the Divine Will." From that day to this science has moved steadily toward a larger and broader conception of the universe as the life of God.

Prof. Asa Gray was but a few years later in making preparations for his summer school in botany. In 1878 Johns Hopkins University opened a laboratory for experimental seaside work, in marine zoology. The work done at this laboratory, under the care of Dr. Brooks, at once became famous. The Wood's Holl laboratory followed in 1888, under the care of Dr. C. O. Whitman. At this place was undertaken a more systematic and thorough course of studies. It acknowledged its historic root at Penikese, but it announced at once its lack of sympathy with merely elementary instruction, and

demanding that the greater part of energy be given to original work. For such work it was necessary that three full years be given, if possible. No student was admitted for less than the full year. The work has gone on at this station with increased zeal up to the present time. The leading professors of the United States are among the pupils and workers.

We believe that the first attempt at a summer school for philosophy and literature was that at Concord; altho Bronson Alcott had sketched out something of the kind many years previous. The first session of the "Orchard House School" at Concord brought together Emerson, Professor Pierce, W. T. Harris, Mrs. Chaney, F. D. Sandborn, and many other well known leaders of thought. The first year's program included lectures on Christian Theism, Speculative, Political and Platonic Philosophy, the History and Moral of Art. The tone of the school remained, until it closed in 1887, highly speculative. The only break in this sort of work was that which looked toward a study of Goethe, Dante and Homer. Thomas Davidson hid himself away in the little town of Glenmore, in the Adirondacks, where for several years he devoted his energies to sustaining a school of scientific culture, including a good deal of speculative philosophy.

The door was scarcely opened by these schools when some of the colleges began to establish annexes in the way of summer schools of music, oratory and language. The Amherst school was established in 1877. The Young Men's Christian Training School, at Springfield, Mass., opened in 1887. All of these were preliminary to the real Chautauqua. This movement was conceived in such broad terms that it has given its name to the whole summer school enterprise throughout the United States. It is a wonderful illustration of the fact that popular demand and need gradually finds a perfect expression; and this expression in turn reconstructs the social and economic conditions of the people. As early as 1890 there were over one thousand registered students pursuing Chautauqua studies, in Europe and Asia as well as the United States. Curiously

this great movement started out of the camp meeting, held by our fathers for religious purposes. It was a readjustment of the gatherings of Wesley's day to modern conceptions of life and duty. It was due to the fact that a man of great breadth of culture, as well as depth of religious purpose, Bishop Marvin R. Vincent, came in contact with the religious assembly, and felt that the old fashioned folk mote had served its purpose, and was outgrown by the thought of the people. It is impossible to describe the many-sided development of this great institution. It has sent its tentacles out into every cranny of society, from the Atlantic to the Pacific. How many Circles there are we do not know, nor do we have any data as to the number of students that are enrolled in the several Chautauquas. They go up into the millions. The study of theological questions covers a broader field than that taken by most of our theological seminaries, while the field of scientific research is rivaled by the studies in art, ethics and literature. There are branch Chautauquas in nearly every State.

Among other schools of note are that at Martha's Vinyard, and that at Eliot, Maine, known as Greenacre. The latter has for ten years sustained courses of lectures, but has not carried on systematic study, except a course called the Monsalvat School of Comparative Religions. There are very few colleges at the present time that do not bear some relation to the summer school, either by sustaining a special course or by sending their students and professors to Wood's Holl, or to similar institutions for biological research. There are also a very large number of private enterprises, like Tower Hill in Wisconsin, where a great deal of work is done for teachers in public schools and for the general public. The close relation of Chautauqua to colleges was recognized very early in its career, and gave birth to what is now known as University Extension; an idea as current in Europe as in America.

The summer school not only is an adjustment to the needs of the age, but it takes the pupil home to nature. It is largely out of doors work. It combines social sentiment with study, and unites all ages. It emphasizes the great fact

that education never ends; and that other scarcely less important fact, that the book of all books to study is the original book of creation. Its thought passed over to farm life, and orchard schools were a consequence. Agriculture has especially benefited by these peripatetic methods, and by the courses in entomology and botany offered at Cornell and elsewhere. The chief advantage, however, has everywhere been that the summer schools are free from the traditional forces of our regularly established institutions of learning. These inherit more or less of the medieval, and study as well as behavior is dominated by customs that run back as far as Duns Scotus. This is not true of the Chautauquas. They come out of the nineteenth century; are fresh expressions of modern life and growth. There is freedom to think as well as study, along novel lines. Hazings and gowns for boys are not considered essential to the study of comparative religions, biological research or to lessons in pruning. In all directions economy rules. There are few large expenses, and none for social functions, athletic meets and degrees, altho there are Chautauqua Degrees—rather useless appendages. In all ways the growth of summer schools has been good for our people, and good in its reaction upon our schools. Summer and out of doors tends to vigor and wholesomeness, to clearness of thought and purity of life more than the lamp and the cell. What comes of it is not monkish, or bookish, but simple and natural.

Labor Laws

THE May *Bulletin* of the New York State Library is devoted to a review of legislation throughout the United States for the year October 1st, 1901, to October 1st, 1902. This legislation is arranged in thirty-nine classes, and each class is treated by a writer of special qualifications for his task.

The tendencies of legislation relating to labor are always of particular importance. They vary considerably year by year, one period being marked by many laws and increased regulation of industry, and another by few laws and a cautious handling of the subject.

In the current *Bulletin* general labor legislation is summarized by Mr. Adna F. Weber, Ph.D., chief statistician of the New York State Department of Labor, while factory regulations are summarized by Mr. Horace G. Wadlin, Librarian of the Boston Public Library and formerly chief of the Massachusetts Bureau of Statistics of Labor. It is notable that in both classes of laws somewhat greater activity has been shown by the Legislatures than was displayed during the previous year. Mr. Wadlin wrote a year ago:

"The statutes of 1901, which may be classed as protective legislation, intended to safeguard the workman in his employment, or to secure to him his wages, are neither very numerous nor very radical."

During the last year reviewed, however, new regulations, while perhaps not very radical, were fairly numerous.

Laws specifically relating to factories were passed by several Legislatures. Iowa strengthened and extended its statute relating to the duties of its Commissioner of Labor Statistics so as to cover "the means of escape from and the protection of life and health in factories, the employment of children, together with the number of hours of labor exacted from them and from women." Increased sanitation and the better grading of machinery in factories were also provided for, and the employment of persons under 16 on dangerous machinery was prohibited. Kentucky provided for the collection of statistics concerning labor and for the inspection of factories, machine shops and work shops. New Jersey provided for seven additional deputy factory inspectors. Massachusetts ordered the providing of fresh and pure drinking water for all employees in all manufacturing establishments.

Mining was also a subject of further legislation. Iowa ordered a semi-annual inspection of coal mines having an output of 50 tons or more a day and put further precautions about the work of coal blasting, while Maryland revised its mining laws in a number of particulars.

Sweat shops were more rigorously regulated in Maryland. Inspection is now ordained in dwelling places used

for the making of clothing, furs or fur trimmings, purses, feathers, artificial flowers, cigarets and cigars, and a written permit for such manufacture is required.

Of more general labor legislation, the safeguarding of children in their employment received considerable attention. Minor alterations were made in the laws of Massachusetts and Ohio, in the latter the prohibitive age being raised from 13 to 14 years. Maryland raised the age limit in factories from 12 to 14 years, tho with numerous exceptions, and prohibited the employment of persons under 16 years in the manufacture or sale of liquors. Kentucky made unlawful the employment of persons under 14 in factories, work shops or mines, unless with the consent of the County Judge, tho to the County Attorney is given the power of overruling the decision of the former.

The hours of labor on public works met with less than the usual amount of attention. California voters carried a Constitutional amendment making eight hours a maximum day's work in public employment, and the New York Legislature passed a concurrent resolution in favor of a Constitutional amendment empowering the Legislature to regulate hours, wages and other conditions of labor on public work. The hours of women and children in factories were reduced to 58 in Rhode Island, while Louisiana brought within its 60-hour law for women and minors under 18 those employed in telegraph and telephone offices.

The hours of male adults in most, if not all, branches of industry were made amenable to legislative acts through a Constitutional amendment passed by Colorado voters in November, 1902. Both Rhode Island and Louisiana prescribed 10 hours' labor, to be performed within 12 consecutive hours, as the maximum day's work for street railway employees.

Employers' liability was the subject of much discussion and of several laws. Virginia modified the common law doctrine regarding negligence of a fellow servant by making railroad corporations liable when the employee's injury is caused by the negligence of

agent or officer, or person superior to employee, or neglect of co-employee in another department. Ohio made all employers liable for injuries caused by the negligence of employees intrusted with the duty of inspecting or repairing machinery and appliances. New York's law is similar to the Virginia statute, tho it applies to all employers. Maryland combined insurance with employers' liability, and enacted a novel law providing for the payment of \$1,000 to the heirs of a workman killed in the course of employment in steam and street railways, quarrying, mining and public works.

As is well known, labor legislation has been more guarded and less common during the last few years than at an earlier period. Employers have stedfastly fought advances on this line, and the courts have frequently interposed on grounds of restraint of liberty and violation of freedom of contract. The list of eight-hour, minimum wage and similar laws declared unconstitutional by State courts during the last five years is rather remarkable for its inclusiveness. Nevertheless, there are signs that on two lines at least labor legislation will score marked advances in the not remote future. One of these is child labor, the abuses of which have roused a strong public sentiment for reform. The other is the reduction of hours in dangerous trades. The decision of the United States Supreme Court in the Utah case acknowledges the police power of the Legislature in dealing with this subject. Colorado, it is true, waived this decision, and secured its rights to interpose by means of a Constitutional amendment; but in many other States it is expected that the Legislatures will assume the exercise of the power which the Federal Court has acknowledged to be indubitably theirs.

New Sayings of Jesus The excavations at Oxyrhynchus have produced another fragment of a Greek papyrus containing some new "logia" which seem to be as important as those discovered in 1897 at the same place. The new papyrus is very imperfectly preserved, but contains six say-

ings, each of them introduced, as in the document earlier found, by the words "Jesus saith," and the whole is introduced as "the words which Jesus, the living Lord, spake" to two of his disciples. Two of the sayings are to be found in the Gospel as we have it. These are: "The Kingdom of God is within you," and "Many that are first shall be last, and the last shall be first." Part of one of the others, "He that wanders shall reign and he that reigns shall rest," is quoted by Clement of Alexandria as from the Gospel according to the Hebrews. This will assist in identifying the source of these fragments, and possibly also of the "logia" found in 1897, which Professor Harnack and others referred to the Gospel according to the Egyptians. Numerous fragments of lost Greek classics were also found, and an epitome of Livy covering Books 37-39 and 49-55. All the books of Livy later than the forty-fifth are lost, and the epitome of Livy which is known differs in its contents very much from this one. None of these literary fragments possesses the value of the Timotheus poem which we published not long since, but they serve to keep expectation awake as to what may any day be found.

The United Nations

If the Hague Court has been the greatest achievement so far accomplished toward the confederation of the nations of the world, it will interest our readers to know that on April 22d of this year a much more radical treaty was promulgated at the City of Mexico between certain of the Latin American republics. The treaty, whose full text has just reached us, does nothing less than provide for *compulsory* arbitration between nations. It is a direct outcome of the Second International Conference of American States, held in the City of Mexico in the last months of 1901. The treaty was then signed by the accredited representatives of Argentina, Bolivia, the Dominican Republic, Guatemala, Mexico, Paraguay, Peru, Salvador and Uruguay, with the understanding that it should become effective as soon as three of the aforesaid governments should ratify it. This has now been done by Mexico, Guatemala and Uruguay. The article

which provides for compulsory arbitration is as follows:

"The high contracting parties obligate themselves to submit to the decision of arbitrators all controversies that exist or may arise among them and which diplomacy cannot settle, provided that in the exclusive judgment of any of the interested nations said controversies do not affect either the independence or the national honor. Independence or national honor shall not be considered as involved in controversies with regard to diplomatic privileges, boundaries, rights of navigation, and validity, construction and enforcement of treaties."

If the nations adhering to this treaty were only as powerful as those adhering to the Hague treaty its good effect on the future of the world would be incalculable. As the American people have already made their united states into a Nation, so let us hope the example of the United States, of the Hague Court and the new Mexican Court will eventually make the united nations into a State.

The Case of Mr. Schwab

In some of the current moralizing upon what appears to be virtually the retirement of Mr. Charles M. Schwab from the presidency of the greatest corporation in the world it is assumed that his health was affected and his usefulness impaired by his desire and his attempts to get rich quickly. But Mr. Schwab possessed great wealth when he became president of the Steel Corporation. One cause of his subsequent misfortunes and errors was the fact that he had suddenly become a multimillionaire. His interest in the Carnegie company, acquired by the methods used by Mr. Carnegie to encourage his young assistants, was suddenly materialized in tangible and valuable securities when the great property was merged in the Steel Corporation. After the consolidation it was estimated that Mr. Schwab possessed a fortune of between \$20,000,000 and \$30,000,000. He had been living in a modest and conservative way. As the head of the great Corporation, with an office in New York, he became associated with men who had long been accustomed to use in the great cities of the world the incomes of such fortunes as his. We judge that he set out to follow them in taking advantage of the material comforts and enjoyments

which are available for the multimillionaire, and at the same time not only to perform the work of his office but also to engage in large industrial projects outside of it. This was a task too great for any man, and surely too formidable for one of his previous training and environment. The cares and responsibilities of the Steel Corporation presidency were such that he could carry them with safety only by avoiding other cares and by living in a simple way. But he began the erection of a city mansion which was to cost \$3,000,000, planned the establishment of a country seat, became deeply interested in new industrial combinations—such as the Shipbuilding company, the Foundries company, etc.—and also devoted a part of his time to charitable projects. Under all this weight his health gave way. While trying to regain it he was guilty of indiscretions—in no way criminal or immoral—which impaired public confidence in him as a trustworthy and conservative manager of great undertakings. More recently the reverses of the Shipbuilding company tended to associate him in the mind of the investing public with a badly conducted and unsuccessful corporation. For these reasons he became a less valuable asset of the Steel Corporation. The lesson of it all is obvious. Mr. Schwab has suffered by reason of the temptations of great wealth suddenly acquired or materialized, and of the new associations acquired with it, but not by any indulgence in speculation with the hope of becoming rich. If he had confined his energies to the business of his office and been content with the moderate life and simple pleasures which had satisfied him before the merger took place, he would have had before him many years of excellent and admirable service.

Stanford University

The announcement of Mrs. Stanford in her inaugural address as president of the Board of Trustees that henceforth the power to choose and discharge professors would be taken from President Jordan and given into the hands of the trustees, relieves him from an anomalous and at times embarrassing position. To exercise unlimited power is very pleasant, but to have it supposed that you

can do anything you wish to do, and at the same time to know that you cannot, is quite the contrary. Whatever view we may take of the dismissal of Professor Ross, it is not to be supposed that President Jordan acted entirely on his own judgment in the matter, for his course was not in accordance with his decided and outspoken character. On the whole President Jordan's career as an autocrat has been a successful one. He has picked out good men in most cases, and under the influence of his powerful individuality the university has in a remarkably short time come to have a character of its own. Under the new *régime* his power will probably be as great as it has been, but his responsibility is less. In the future if any suspicion arises that freedom of teaching is being interfered with, it will be Mrs. Stanford and the other members of the board who will have to stand the criticism. The existence of a university during the life of its founder is a perilous one, even in those rare cases where the patron has the tact not to interfere with the management; but such an institution, once founded, has a life of its own which lasts through centuries, and its work becomes far greater and more important than the mind of its founder conceived.

Utah a Model State

The special grand jury which has been investigating the charges that polygamy exists in Utah reports that it "has not been able to secure evidence that a single case of polygamy has occurred in this district since Utah became a State. The rumors of the commission of this crime seem to have grown out of innocent circumstances which in ordinary communities would have created no suspicion or scandal." Thus at last "the twin relic of barbarism" is completely extinct. Let us all rejoice over this healthful condition of morals in Utah, where there is not only no crime, but public opinion is so vigilant that even minor indiscretions and violations of etiquette are severely censured. The jury is quite right in thinking that Utah is no ordinary community. It certainly could not be truthfully said of any other State in the Union that there had been no cases of polygamy in it for the past seven years.

Publishers and Book Sellers The "agreement" of the principal publishers of the country to refuse to sell books to retailers who will not maintain the fixed price for the public has been declared by the courts "a combination against the public policy, illegal and void." It has been found practically impossible to enforce the rule in the case of some department stores, and some readers have been greatly irritated by the publisher's announcement on the little slip of paper, which, falling out of a newly opened book, informed them that here was another thing that they could not do, and deprived them of the delightful sensation of getting something at a discount. Now both classes of book buyers, the lovers of bargains and the lovers of freedom of trade, will be happy, and probably some other method, less obnoxious to the law and to the country readers, will be found to protect the interests of the book sellers. It will be recalled that Ruskin objected strenuously to the present method of selling books on the ground that it was in violation of economic, or, as he would say, moral laws, and he had his publisher put his later books on the market at a fixed and known price, the same for one or a thousand copies, and allowed the book sellers to charge whatever more they wished to for the trouble of handling them. This innovation was not, however, practically a success, notwithstanding the reputation of the author and the number of his followers.

A Mosquito Destroyer

Very welcome news comes from the laboratory of the Public Health and Marine Hospital Service at Washington of the discovery of a parasite fatal to the mosquito by Dr. C. W. Stiles, who made such a sensation last year by the announcement of what was called "the germ of laziness" as the cause of degeneracy of some of the poor whites of the South. The new mosquito parasite has been named by its discoverer *Agamomeris culicis* and belongs to the family of gordius or horsehair worms. It infects the mosquito during the larvae or pupae stages and grows in the abdominal cavity. It is thought that seasons and places in which mosquitoes are few owe their immunity to the fact that the conditions are favor-

able to growth of the mosquito disease, and this suggests the possibility of assisting in the propagation of the parasite as a means of getting rid of the most dangerous of our insect pests. Instead of the method now used, of covering with oil the surfaces of standing pools and swamps, it may be more effective to see that they are supplied with the mosquito worm. We must not hope too much from this, however, for parasites fatal to the chinch bug and to the grasshopper have been known for years, and it has been found possible to spread these diseases artificially, yet there have proved to be great practical difficulties in the way of exterminating or even controlling the ravages of these insects. We can, nevertheless, take comfort in the thought that the mosquitoes, who are trying to inoculate us with malarial or yellow fever germs, have troubles of their own, and we may be charitable enough to think that their bad temper is due to intestinal worms.

The Young Woman's Christian Temperance Union of San Francisco attacks President Benjamin Ide Wheeler, of the University of California, for smoking cigarets on trains in the presence of students, and drinking in public places. We cannot discuss now the propriety of President Wheeler's conduct, but we wonder why so much emphasis was laid on the publicity as an aggravation of the offense. What effect would it have on the morals of the students to know that President Wheeler smoked and drank in the privacy of his own apartment, but avoided being seen at these amusements for fear of setting a bad example?

The city of Harrowgate, England, has just opened a handsome municipal Kursaal. Kursaals, as our readers who have traveled much know, are familiar features of the famous resorts of Europe, but this is the first time in which an English city has owned and operated a pleasure house. English municipalities are away ahead of us in all manner of socialistic experiments, for they not only have successfully solved the problem of public ownership of gas and water and street railways, but they even go so far as to municipalize the milk supply and breed rabbits.

INSURANCE

Old Maids' Insurance

A COMPARATIVE novelty in the line of insurance prevails in Denmark, in which country if a sum approximating \$200 is deposited with an insuring company on behalf of a girl at birth she becomes entitled, if unmarried at thirty years of age, to receive an annuity of nearly \$25, which is increased by \$25 every ten years. In case she marries before the age of thirty the original amount deposited is returned to her. If she dies before attaining that age there is a provision in the policy that makes available a sum of from \$30 to \$35 toward her funeral expenses. With the growing tendency toward an expansion of insurance, and its extended application, it might not be out of place if we had in this country a reliable old maids' insurance system, or a system of insurance against the possibility of spinsterhood. This would provide a financial compensation for domestic joys denied the insurer and would be perfectly legitimate.

THE Agricultural Insurance Company, of Watertown, N. Y., has just completed a half century of existence, having been founded at Evans Mills, Jefferson County, N. Y., in 1853. It was originally designed for the benefit of agriculturists. In 1893 the company began to substitute mercantile classes for farm business, and since then, its methods have been gradually assimilated to those of the ordinary Agency Company. The company's statement in its recently issued handbook, that it incurs and pays a loss every other hour of the working day, is most interesting. Notwithstanding this fact it makes reasonable gains in strength as the years roll on. The building now occupied by the Agricultural Insurance Company was purchased in 1892. Its assets at the present time are \$2,566,249.52; liabilities, except capital, \$1,449,189.10, and its surplus to policyholders is \$1,117,060.42. The officers and directors for 1903 are: President, Hon. A. H. Sawyer; Vice-President, Chauncey

Patterson; Secretary and Treasurer, William H. Stevens; Assistant Secretary, John Q. Adams; Cashier, Lewis F. Phillips; Superintendent of Agencies, Hiram Barnum. The directors are: John Q. Adams, D. M. Anderson, H. Barnum, R. J. Buck, John C. Knowlton, D. C. Middleton, J. R. Miller, C. Patterson, A. H. Sawyer, Titus Sheard, W. C. Stebbins, E. B. Sterling, W. H. Stevens, N. P. Wardwell and R. S. Whitman.

....The Royal Arcanum, in the matter of certain changes recently made in its constitution, laws, rules and regulations, is manifesting a tendency toward conservatism. For example: It now proscribes certain occupations, and a member of the order designing to enter a proscribed occupation is obliged to conform to new rules calling for the filing of a waiver, which is attached to his application, and if approved by the supreme secretary it thereupon becomes and remains a part of the member's contract with the order. Another change recently made in the Royal Arcanum scheme is a clause relating to suicides which reads as follows:

"The taking of his own life by a member within five years from and including the date of his initiation, whether he be then sane or insane, shall cancel and render null and void his benefit certificate, and terminate all rights and privileges of all persons thereunder and under his membership in the Order."

Further proposed innovations on the part of the Royal Arcanum relate to old age benefits. The proposition relative to old age benefits, which has been considered but not approved by the order, provides that a member who has attained the age of 65 years shall have the option of withdrawing from the order, and of receiving thereupon the amount paid to the W. & O. B. fund during his membership. There are a number of obstacles in the way of bringing about some of these changes in the Royal Arcanum, but the fact that they are being considered indicates that those in control of the order appreciate the necessity for some kind of reorganization to meet the conditions which obtain now that the order has advanced in years.

FINANCIAL

Bountiful Crops Promised

THE Government's crop report, published at the end of last week, points to an abundant yield of grain. Condition percentages (on July 1st) as interpreted by the statistician of the Produce Exchange, indicate a wheat crop of 720,627,000 bushels. The promised yield of winter wheat (463,498,000) has never been equaled at the harvest in any previous year; the quantity of spring wheat now indicated (257,129,000) is about the same as last year's spring crop. The total has been surpassed only in 1901, when the yield for the first time exceeded 700,000,000 bushels. Last year's crop was 670,063,000. A crop of corn equal to the enormous one of last year (2,523,000,000 bushels) was not expected, but the condition of the growing plants on July 1st indicated a yield of 2,262,960,000, and the weather since that date has been very favorable. This indicated yield has been surpassed at the harvest only twice, in 1902 and in 1896. Last year's crop of oats (987,000,000 bushels) was an extraordinary one, for 800,000,000 had been exceeded in only two years. The reports point this year to a crop of 851,000,000 bushels. If so much is harvested, the yield will be second only to the great crop of 1902. There is no warrant for discouragement or depression in the promise of the grain fields.

Financial Items

THE Van Norden Trust Company, of which Warner M. Van Norden is president, and whose capital is \$1,000,000, and surplus and undivided profits \$1,137,671.12, has purchased a majority of the stock of the Nineteenth Ward Bank of this city.

....James G. Cannon, vice-president of the Fourth National Bank; General Brayton Ives, president of the Metropolitan Trust Company, and William Lanman Bull, the committee of the creditors of the firm of Price, McCormick & Company, who failed in 1900, have paid in full the secured creditors and have paid

almost in full the unsecured creditors. Securities were realized upon to the best advantage and law suits were avoided, and the committee is to be congratulated.

....The Equitable Trust Company of New York, of which Alvin W. Krech is president and James H. Hyde and Lawrence L. Gillespie, vice-presidents, shows total resources on June 30th of \$39,227,460, an increase during the past six months of \$23,805,054. The capital is \$3,000,000, an increase during the past six months of \$2,000,000. The surplus and undivided profits are \$8,772,554, an increase since last December of \$8,153,068.

....Plans have been completed for a remarkable combination of banking interests in Pittsburg. The Colonial, American and Pennsylvania Trust companies; the Farmers' Deposit, Colonial, Columbia and Tradesmen's national banks; the Germania Savings Bank and the Freehold Bank are to be merged, probably under the name of the Colonial Trust Company, with a capital of \$7,000,000 and combined resources of \$78,000,000.

....Embezzlements and defalcations of \$612,982 in the United States during the month of May as tabulated in the current issue of *The Monthly Bulletin* of the Fidelity & Casualty Company show an increase of \$78,019 over the March defalcations. The May items were as follows:

Banks	\$195,173
Building and loan associations.....	30,000
Benevolent orders and associations.....	14,810
Court trusts.....	1,781
Federal and State.....	25,475
Firms and corporations.....	169,364
Insurance companies.....	140
Municipal	78,730
Transportation companies.....	28,322
Miscellaneous	69,187

Dividends announced:

Chic., Rock Is. & Pac. R'way, quarterly, \$1.25 per share, payable August 1st.

Rock Island Co., Preferred, \$1.00 per share, payable August 1st.

Louisville & Nashville R.R. 2½ per cent, payable August 10th.

U. S. Fire Ins. Co., 2 per cent., payable on demand.

NEW YORK, THURSDAY, JULY 23, 1903

No 2851

Survey of the World

Political Topics

An extra session of Congress will be held, beginning on November 9th, immediately after the fall elections. While the main purpose of this session will be to enact legislation in support of the treaty of reciprocity with Cuba, it is known that the President desires early action upon questions affecting the currency, and that work upon a currency bill may be undertaken before the December session.—Conflicting reports as to the probable fate of the canal treaty at Bogota have been received at Washington. According to one statement there is a majority of 12 in the Colombian House against ratification. Other reports say that the treaty may be ratified with an amendment increasing the sum which the United States is to pay from \$10,000,000 to \$25,000,000. Debate upon the treaty will not be interrupted by the beginning of a regular session of Congress this year. It has recently been decided that the regular session cannot, under the constitution, be held before July 20th, 1904.—At their convention last week the Republicans of Kentucky nominated Morris P. Belknap, of Louisville, for Governor, and adopted resolutions calling for the nomination of Mr. Roosevelt in 1904. The platform contains a paragraph denouncing "assassination and lawlessness, whether in Servia or Kentucky, as destructive of civilization," and calling upon "the enlightened intelligence of the State through its legislative, executive and judicial agencies to employ remedies to re-establish order and punish crime within our borders."—A list of the promotions to be made on the retirement of Lieutenant-General Miles (August 8th) and Major-General Davis (July 26th)

has been published by the War Department. Brigadier-General Sumner will be advanced to fill the vacancy in the rank of Major-General caused by General Davis's retirement, Major-General Young will become Lieutenant-General, and Brigadier-General Leonard Wood will be a Major-General, vice Young, promoted. At the same time 32 Colonels and one Lieutenant-Colonel, all of whom served in the Civil War and have been in the army for 35 years, will be promoted to the rank of Brigadier-General, and then immediately placed upon the retired list. The vacancy in that rank is to be filled by the promotion of Colonel Carr. The rapid advancement of General Leonard Wood has been the cause of much comment in the press. His promotion now is in accord with the rule of seniority. It is pointed out that the officer preceding him will reach the age of retirement in 1907, while General Wood will then have 17 years to serve. During those years he may be in command of the army, and it is said that if he should hold that rank until 1924 no Brigadier-General now on the list, except Funston, could rise to that place. At the beginning of the war with Spain General Wood was an assistant surgeon with the rank of Captain. In that war he served as Colonel, Brigadier-General and Major-General of volunteers. Afterward he was appointed a Brigadier-General in the regular army by President McKinley.—As if to show that he was still in the prime of life Lieutenant-General Miles rode horseback last week from Fort Reno to Fort Sill, Oklahoma, a distance of 90 miles, in 9 hours and 20 minutes, having nine mounts during the journey and covering one stretch of 35

miles in 2½ hours. At the end he was in excellent condition, altho the heat had been intense, and he reviewed the infantry of the station.—William Cary Sanger, Assistant Secretary of War, is about to retire on account of the ill health of his wife. The President has selected to succeed him Gen. Robert Shaw Oliver, of Albany, a veteran of the Civil War and at present a Brigade Commander of the National Guard of New York. Upon General Oliver will devolve the duty of reorganizing the militia under the law recently enacted. Some expect that Secretary Root will resign after his return from London, where he is to take part as a member in the sessions of the Alaska Boundary Commission. It is also thought by some that General Oliver may then succeed him at the head of the department.

The Investigation at Washington

As a result of the investigation concerning frauds in the postal service George W. Beavers, formerly Superintendent of the Division of Salaries and Allowances, has been indicted in Brooklyn, where for some years he has resided. At the very beginning of the investigation Beavers resigned. He had been in the Department for 22 years and (like Superintendent Machen, who has also been indicted for receiving bribes) was exercising much power. First Assistant Wynne, immediately after taking office, found that these two prominent subordinate officers were very influential and that they resented any interference with their action. Beavers, whose current expenses are said to have been far in excess of his salary for a long time past, is charged with receiving from Congressman Driggs (recently indicted) a part of the money paid to the latter in connection with the contract for automatic cashier machines.

The Acts of Lynching Mobs

There has been no further disorder at Evansville, but five members of the militia company that defended the jail have been discharged from employment by local merchants at the request of the labor unions. A grocery firm by

which the captain of the company was employed was threatened with a boycott, it is stated, if it should retain him in its service, but was restrained from dismissing him by the emphatic protests of the Citizens' League. The Business Men's Association, at a large public meeting, undertook to find work for the men who had been discharged. Governor Durbin declares that the dismissal of an employee because he has responded to the call of the State is an act of treason.—Speaking in Milwaukee on the 13th, Justice Brewer, of the Supreme Court, said:

"Every man who takes part in the burning or lynching of a negro is a murderer, and should be so considered in the eyes of the law. Altho it is always given in defense of such actions that what are known to lawyers as extenuating circumstances lessen to a considerable degree the gravity of the offense, it is my opinion that no circumstances whatever can change the classification of the crime to anything else but murder. The man who takes part in the burning of a negro, no matter how atrocious was the latter's conduct, is guilty of this crime. In the South the lynching of a negro who has committed an assault on a white girl is considered proper and just, as is the summary shooting of a man who calls you a liar to your face. In neither case do I consider the circumstances extenuating in the least. The crime can be called nothing else than murder."

He expressed his belief that there would soon be a popular reaction against lynching.—During last week, in the neighborhood of New York, several negroes narrowly escaped being lynched for rape. Twelve miles below Albany a large party of farmers sought the life of a negro, whose victim was the little daughter of one of them, attacked while she was picking berries. To protect him he was taken from the jail at Coxsackie to a stronger prison. Another negro, who had attacked two little girls in a berry pasture at Liberty (Sullivan County), was with some difficulty saved from lynching. In Red Bank, N. J., a negro named Thomas Drum entered at night the house of Mayor Davis and attacked the Mayor's daughter, whose cries speedily brought assistance. Drum was captured and placed in jail, from which he was removed to a prison in another town, because some preparation for lynching him

had been made. At Indiana, Pa., a white tramp was pursued and shot by farmers, because he was guilty of assault upon the daughter of one of them. For a similar offense a white man in Whitehall, N. Y., was hastily borne away to prison in another town, owing to the anger of the people.—United States Senator Foster pleaded earnestly with a lynching mob at the jail of St. Mary's Parish, La., on the night of the 12th. They had come for a negro who had assaulted a planter's wife. His promise that there should be a speedy trial before a special jury caused them to abandon their purpose.—At Flemingsburg, Ky., three days later, a white man named Thacker was taken from jail and lynched. Guilty of an atrocious murder, he had had two trials (each ending with a life sentence) and was waiting for a third, which had been granted. As he was a man of means and influence, it was feared that he would escape punishment.—At Lake Butler, Fla., a negro was lynched by a mob of negroes for assault upon a negro woman.—The trial of Turner, a rich planter of Alabama, for holding negroes in peonage, ended in a hopeless disagreement of the jury (six to six), altho Judge Jones had told them that guilt had been proved by the evidence for the defense alone.

Labor Questions Addressing the Bar Association of Iowa last week, Justice Brewer, of the Supreme Court, defended the use of injunctions in labor controversies, saying:

"There is clamor against the exercise of the equitable power of injunction by the courts. An effort has been made to make of it a political question. Government by injunction has been made the subject of easy denunciation. So far from removing or restricting this power, there never was a time when its full and vigorous exercise was worth more to the nation than it is to-day. As the population becomes more dense and as the interests of the people grow and crowd each other, the restraining power of a court of equity is of far greater importance than the punishing power of a court of criminal law. I am aware that the labor organizations are especially sensitive on this subject and think that the injunction is used against them and to their prejudice. But they will come to see that there is no thought of disturbing them in the peaceful exercise of

their rights, but only of preventing wrong and violence."

—At Rochester Justice Nash, of the New York Supreme Court, has made permanent an injunction obtained by a manufacturing company against the local union of machinists. No question of wages was involved, the strike having been ordered because the company would not agree to employ union men exclusively. The union is forbidden to argue with the men now employed. Justice Nash holds that "the common law right of action for enticing away from the master a servant or employee" has not been taken away by legislation, "unless possibly for the purpose of obtaining an advance in or maintaining a rate of wages. Hence," he adds, "when the rights of the master are unlawfully interfered with and there is not an adequate remedy at law, equity will take jurisdiction by injunction."—A settlement of the controversy between the builders and their workmen in New York has been delayed, but it is expected that 36,000 men will be at work this week. Seven unions that have accepted the builders' arbitration plan have for this action been expelled from the Board of Building Trades, which is controlled by Samuel J. Parks and other walking delegates. The grand jury has found four indictments against Parks for extortion and blackmail, and has also indicted for similar offenses two other walking delegates, Timothy McCarthy and Richard Carvel. The arbitration plan is designed to deprive the walking delegates of their power and to prevent sympathetic and other strikes in the building industry.—The street railway strike at Bridgeport, where there was a riot on May 17th, has been declared off by the union, which at the same time expelled and blacklisted 45 members who voted the week before last to end the strike in a meeting at which they had a large majority, and who afterward returned to work, holding that a vote of 45 to 19 was sufficient warrant for such action.—The striking teamsters convicted at New Haven of assault and conspiracy have been sentenced to be imprisoned for two years.—After negotiations continued for three months the Illinois Central and Chicago and Alton railroad companies have increased the wages of their trainmen by

nearly 15 per cent.—Chief P. M. Arthur, of the Brotherhood of Locomotive Engineers, widely known as a judicious and conservative labor leader, fell dead while speaking at a banquet in Winnipeg last week. With much emotion he was acknowledging a beautiful gift presented by his associates. "It may be," he was saying, "that these are my parting words to many of you. No one can tell when—". At this point death came.

Our Islands in the Pacific Both the original Opium Concession bill and the substitute recently introduced by the Philippine Commission at Manila have been tabled. A special commission has been appointed to visit Oriental countries and investigate the regulations enforced by them. The original bill, as explained heretofore, provided for an opium monopoly, with regulations designed to prevent the use of the drug by all except Chinamen, who were accustomed to it. The substitute permitted opium to be imported only by pharmacists, and allowed them to sell it only upon a physician's certificate. Governor Taft earnestly supported the original bill, asserting that it would prevent the use of opium by Filipinos and Moros, and effectively regulate the use of it by the 100,000 Chinese in the islands. He remarked that the opium habit as commonly practiced by Chinamen, was less harmful than the whisky habit.—It was recently asserted in dispatches to London newspapers that an American war ship had visited and seized several small British islands off the northeast coast of Borneo, hoisting the American flag over them and setting up tablets as evidence of American sovereignty. Two of the islands, it was said, commanded the harbor of Sandakan, which is the capital of British North Borneo. Nothing appears to be known in Washington of any recent action of this kind, nor has any word concerning it been received there from the British Government. The treaty boundaries of our Philippine possessions did not include several small islands of the Sulu group, which should have been ceded to us by Spain. Therefore, in November, 1900, by an additional treaty and the

payment of \$100,000, we obtained possession of the islands of Cagayan (60 miles from Borneo) and Sibutu (12 miles from Borneo), with fourteen small islands tributary to them. Upon these the American flag was raised. As some of the small islands of the Sulu group are said to have passed to the control of the British North Borneo Company in 1881, it is possible that an error has been made; but it is held at Washington that we are clearly entitled to the seven islands, which are named in the London papers. They are of no value except for strategic purposes.—The new American cable across the Pacific to Manila will soon be extended from that city to Shanghai.

**The Kishineff
Petition**

The incident of the Kishineff petition has been closed. On the 15th inst. Secretary Hay transmitted to Mr. Riddle, Chargé d'Affaires at St. Petersburg, a copy of the petition, signatures excluded, instructing him to ask for an audience with the Russian Minister of Foreign Affairs, to say to the Minister that a respectful petition (addressed to the Czar) from "a large number of citizens of all religious affiliations and occupying the highest positions in public and private life" had been received by the President, and to ask whether it would be received by the Minister for submission to the Czar. An audience was granted. The Minister's reply, as reported by Secretary Hay, was that "in view of publications which had appeared in the newspapers, the Russian Government desired to notify Mr. Riddle that the proposed petition would not be received under any circumstances, but that the Government's resolution had been taken independent of any consideration of the substance or terms of the petition." The petition was really before the Minister because it had been made a part of Mr. Riddle's request. Members of the B'nai B'rith Committee who prepared the petition say that the President's action has been most satisfactory to them. The movement, they think, has had all the good effects that were in contemplation, because it has enabled the American people and Government to make a record on the question, and has

also acquainted the Czar and his Minister with the contents of the petition.

Cuban Treaties Ratified The treaties or agreements with the United States relating to the naval and coaling stations and the Isle of Pines were ratified by the Cuban Senate on the 16th inst. On the lease agreement the vote was 9 to 6, and 8 to 4 was the record for the Isle of Pines treaty. There remains to be prepared and discussed a permanent treaty embodying the provisions of the Platt Amendment. Upon this question no action was taken before the final adjournment of the present session of Congress, which took place on the 18th. The Cuban Government has given Minister Squiers a promise that there shall be no penal station on the Isle of Pines and that teachers who speak English shall be employed there.—President Palma has been authorized to appoint a commission which is to make an inquiry in this country and elsewhere as to the negotiation of the loan of \$35,000,000 for which Congress voted in February last. Interesting questions concerning the supervisory power of the United States may be raised in connection with this loan, owing to that paragraph in the Platt Amendment which says that Cuba shall not assume or contract any public debt for the interest of which, together with sinking fund requirements, the ordinary revenues of the island, after current expenses are paid, are inadequate.—The Rural Guard has recently lost two or three hundred men because the pay was insufficient. A mounted guard received \$42 a month and was required to furnish his horse, fodder, clothing and subsistence. Congress has now voted to increase the guards' pay and to provide for the employment of an additional number. A few months ago there were 1,600 men in the service.—This year no cases of yellow fever have originated in Havana, and only three have entered the harbor. All of these came from Mexican ports.

Venezuela President Castro last week put down another revolution that was started against him by General Orlando for no apparent reason. There have been several skirmishes

in the outlying provinces previously between the Government forces and the revolutionists. Last week the Government troops surrounded Ciudad Bolivar. General Orlando, finding himself in a trap, signified his willingness to capitulate if the life of General Ferrera would be spared. Castro refused to take anything but an unconditional surrender, so last Monday the Government forces attacked the city with a large army and five war vessels and succeeded in taking the town after a desperate struggle, in which they lost over 100 troops, while the revolutionists lost about 200 killed and twice as many wounded. At the present writing it would seem as tho the revolution was broken. Venezuela is paying promptly her debts to the allied nations, and the claims of all the various nations are being adjudicated in Caracas. The Hague Court will open on September 1st, but it has been remarked that the Czar of Russia has not yet appointed the judges.—In the other South and Central American nations more quiet than usual prevails. Peace reigns in Central America, and except for the smoldering in Colombia and Santo Domingo and the serious labor strike in Valparaiso, Chile, there is nothing of turbulent nature to report. A treaty of great importance has been signed by Chile and Bolivia, in which Bolivia gives up its long cherished ambition to get an outlet to the sea through its own territory, while Chile in return finances a railroad that will take Bolivian goods to the sea through a port in Chile. There is some talk of Argentina annexing Bolivia, but that is hardly to be thought of, as it would probably precipitate a war with Chile, who looks upon Bolivia as her especial ward.

The Death of the Pope After another week of suspense, during which the news from the Vatican was eagerly read by people of all nationalities and religions, the announcement was made on Monday morning that Leo XIII had passed away. His last words before sinking into unconsciousness were, "I will die content, for I feel that if I have merited the good will of the Saviour, he will have mercy." During the week he had been gradually failing, periods of unconsciousness and delirium alternating with intervals when his mind regained

its clearness, but on Sunday he sank into a state of coma, from which he did not again rally, and the closing of the great bronze gates of St. Peter's in the face of the multitude of anxious watchers who filled the square announced the approaching crisis. Cardinal Oreglia di Santo Stefano, as Dean of the Sacred College, and Cardinal Camerlingo will have charge of the affairs of the Church until after a new Pope is elected by the Conclave, which will convene within ten days.

Two Ports Opened in Manchuria

China has agreed to incorporate in the new treaty provision for opening two new ports in Manchuria to the commerce of the world, and assurance has been given to our Government that Russia will consent to this action. Which ports they are is not officially announced by the Department of State, but it is understood that Mukden and Ta-Tung-Kao are the points selected. Mukden is a city of 180,000 inhabitants, the capital of Manchuria and the former seat of the present reigning family of China, and connected with the Russian-Manchurian railway system. Ta-Tung-Kao is a small place of no importance in itself, but situated as it is near the mouth of the Yalu River and at the entrance to Korea it is capable of being developed into a great commercial center. It is said the United States might have secured special privileges from Russia, but that Secretary Hay has adhered to his policy of the open door in Manchuria and has now secured an important diplomatic triumph. A conference of prominent Russian officials has just been held at Port Arthur in which the Russian policy in regard to Manchuria is supposed to have been arranged. It is regarded as significant that General Kuroptkin, the Minister of War, in laying the corner-stone of the cathedral there stated that "Port Arthur is now becoming a fortress inaccessible to all enemies, no matter how great their number or whence they come." Manchuria now imports over \$2,000,000 worth of American manufactured articles per annum, so it is of great importance that no restriction shall be put upon our trade there. Our consul at Niu Chwang reports that the Moscow merchants are making great efforts to

secure the Manchurian trade in cotton goods, which amounts to \$12,180,000, and that they have a great advantage over us in the evasion of customs duties. Sir Robert Hart, the chief of the Imperial Chinese Customs, tried to stop the importation of Russian goods into China by land without payment of duty, but he was compelled to appoint Russians to all posts in Manchuria.

Asking for an Open Port in Korea

Korea has asked China to allow the opening of Wiju on the Yalu River to foreign trade, as a necessary measure for the independence of Korea. It is not known yet whether the permission will be granted, but if it is it will be an important step in breaking down the barriers of the "Hermit Nation." Wiju is the gateway between Manchuria and Korea, and the river at this point is defended by patrols and guard houses for a hundred miles. In 1901 a railway was surveyed through the very difficult country from Wiju to Seoul, the capital, a distance of 350 miles, and two million and a half dollars were borrowed from a French company for construction on the security of the rich mines of the province, much to the dislike of Japan and England, who feared Russian influence. It is probably at the instigation of the British Government that the request for the opening of the port is made. Since Wiju guards the opposite side of the mouth of the Yalu River from the port of Ta-Tung-Kao, which has just been opened at the request of our Government, the opening of these two ports will mean the freedom of commerce for the rich and undeveloped valley of the Yalu. Wiju, which is on some maps as Ai-chau, is situated on a hill overlooking the river and is surrounded by a wall of light colored stone. According to Griffis French missionaries used to enter Korea at this point by disguising themselves as wood cutters, crossing the Yalu River on the ice and creeping through the water-drains in the granite walls. The province of which this is the entrance is Ping-an, or Peaceful Quiet. M. Pavloff, the Russian Minister at Seoul, announced to the Emperor of Korea that Russia is opposed to the opening of Wiju. This will increase the danger of war between Japan and Russia.

Leo XIII

By a Prelate of the Roman Catholic Church

IN the person of Leo XIII the Catholic Church loses her venerated and trusted chief and the world one more of its great men. Twenty-five years ago Cardinal Joachim Pecci, almost unknown before, was raised to the chair of Peter, and ever since he has held the attention of the age and influenced its doctrines in a measure equaled at most but by a few of his contemporaries. His death awakens a feeling of genuine regret everywhere, most of all, naturally, among his own children of the Catholic faith, tho even their sorrow is tempered by the fact that the extreme old age of the pontiff had prepared them for his sudden departure. They feel too, however, much more might be expected with a further lengthening of life from one whose faculties remained unimpaired to the end; yet his work, the work for which he seemed to have been providentially chosen, was done, and that its completion and maintenance can now without inconvenience pass on into other hands.

Up to a short time before his elevation to the pontificate there was little in the life of the future Pope to suggest the important part he was to play in the last quarter of the nineteenth century, yet in reality everything was silently preparing him for it. Born in 1810 of an aristocratic family, he grew up with that sense of dignity and authority which fits men early in life for the exercise of power. At the age of twenty-seven he was made Civil Governor of the Duchy of Benevento, and it took him but three years to put an end to a lengthened reign of violence and lawlessness, and cause order and security to reign supreme. Promoted next to the Governorship of Perugia, he brought the same clearness of vision and determination of will so remarkable in his subsequent pontificate to bear on the needs of the province, proceeding at once to visit it from end to end, seeing into the details of everything and introducing reforms of which the benefits are felt to the present day. Gregory XVI, who had followed his

course with a fatherly interest, now resolved to introduce him to a bigger world and widen his experience of human affairs. He appointed him Nuncio to the court of Brussels. To become acquainted with European politics and learn the art of statesmanship, of which he was one day to be an acknowledged master, Monsignor Pecci could not have been sent to a better school. Leopold I was one of the wisest and most enlightened sovereigns of his day, and the youthful Nuncio had the good fortune to win his confidence almost at once and to be admitted to live on terms of intimacy with the royal family. Amid such surroundings and in daily contact with the representatives of the European courts, the future Pope soon became familiar with the traditional methods of diplomacy and with the secret springs by which governments are moved and the political business of the world carried on.

Here, indeed, was a most valuable apprenticeship for a future ruler, and we may justly trace back to it the special love for the means and methods of diplomatic action so noticeable in Leo XIII, as well as the practical, conciliatory spirit shown by him in all his negotiations with the secular Powers. But the training was of short duration. The episcopal see of Perugia had become vacant, and as had happened of old to St. Ambrose in the Church of Milan, the people asked that the same one whom they had admired as Civil Governor should be sent to them as their Bishop. Their request was granted, altho the proper place for one so rich in administrative gifts would have been, not in a quiet Italian town, but by the side of the reigning pontiff, to whom his counsels and services might have been invaluable. Unhappily, they would have been little in harmony with the policy of Pius IX, and still less with that of his Prime Minister, Antonelli. The latter disliked or dreaded Pecci, and during his long tenure of office practically confined him to his diocese. But even in that limited sphere the Bishop of Pe-

His Holiness, the Pope

rugia was far from being idle. Besides his incessant work as a student, he infused new life into the old city, established various charitable and educational institutions, devoted himself, in a word, to the intellectual and social as well as to the religious interests of his people. In the movements which during that period agitated Italy and all Europe he seems to have taken no active share; but from the serene and almost solitary heights upon which he lived we may well imagine that he looked far beyond the Appenines and the Umbrian plains, and that, following with undisturbed gaze the ever changing scene of European politics, he saw the old order out and gauged the power of those new principles and forces which were henceforth to rule the world.

At length Antonelli died. Cardinal Pecci was called to Rome and invested by Pius IX, now old and feeble, with one of the most responsible dignities—a tardy compensation for thirty years of apparent neglect. The Pope soon after followed his Prime Minister to the grave, leaving many things behind him in a very unsatisfactory condition. A new direction of affairs was urgent. But this required at the helm a man of clear vision and strong hand, practical, fully alive to the exigencies of the situation; a new man, besides, untrammelled by antecedents and free to follow whatever course his judgment might recommend. Cardinal Pecci was little known to the majority of the electors; but to those who had had more experience of him he seemed to be just the man that was needed. They promptly won the others to their manner of thinking, and after an exceptionally short conclave on the 20th February, 1878, the Bishop of Perugia was placed at the head of the Catholic Church.

That he was eminently fitted for so exalted a position soon became apparent to those who watched him in the first exercise of his supreme power, and the whole course of his pontificate only confirmed their earlier impressions. Leo XIII was truly a born ruler of men—foreseeing, deliberate, conciliating in manner, never arousing opposition needlessly, never yielding to impulse, knowing just how much to expect from those

with whom he had to deal—individuals, governments or peoples—fixed in his aims but satisfied to wait if necessary, or to compromise in what was not essential. Sovereigns and cabinets seemingly so independent are often the least free of all to follow their own judgment, and nobody knew it better or took it more fully into account than Leo XIII. Hence the willingness of statesmen to treat with him as with one who thoroughly understood their position and was always reasonable in his demands. In the book of Maccabees the old Romans are described as effecting their conquests and holding them not so much by the force of arms as by their wisdom and their patience: *consilio et patientia*. The late Pope would seem to have adopted their policy. Prudence, moderation, on the one hand, and on the other patience, persistent effort, hopefulness never destroyed by temporary failure, a belief in the ultimate triumph of justice and truth if only kept steadily before men's eyes, or, in other words, a belief in the fundamental uprightness and goodness of man himself—this we consider to have been the keynote of his action and in a great measure the secret of his success.

For a most successful ruler and guide he unquestionably was from beginning to end. His predecessor, Pius IX, may have excited greater enthusiasm, but at the same time he had estranged the sympathies and weakened the love, tho not the loyalty, of a large and influential section of his children, whereas Leo was almost equally trusted and followed by all. His advent was the harbinger of peace and harmony among Catholics. Divisions, strongly marked under the preceding reign, gradually subsided. Extremes no longer met encouragement in the Vatican. The moderation of the Father silently impressed itself on his children and taught them mutual forbearance where nothing essential was at stake. The Syllabus of Pius IX had roused the world to resistance by the abruptness of its form and the ambiguity of many of its positions. Leo XIII repeated the same doctrines in his encyclicals, but with so much reasonableness and light that they awakened little adverse comment. His conviction was that what estranges men from each other and from the truth is

often nothing but misapprehension, and hence his concern to make the position of the Church on various important issues clear to his contemporaries.

Of all the difficulties he had to face none equaled in magnitude and complexity the unpleasant relations with foreign governments which he inherited from his predecessor. The once liberal and always noble-minded Pius IX had, it must be confessed, gradually alienated the sympathies of the outside world. His relations with almost all the secular Powers had become strained and unfriendly, and his whole policy was reduced to unceasing but unheeded protest, and passive, powerless resistance to the precipitate rush of the age. How completely Leo XIII reversed that condition of things is sufficiently known. One after the other the governments of Europe have resumed relations friendly or at least tolerable with the Holy See. Their example has been followed all over the world and has given its tone to popular feeling. In this country in particular the name of Leo XIII, since he came to be known, awakened nothing but respect and sympathy. It brought up before the public mind the picture of a man of great gifts and high purposes wasted by unceasing labor, but still youthful in thought and energy, sensible to every need of the vast organization over which he presided, but none the less alive to the general interests of humanity; ever ready to raise his voice for the good cause, in sympathy with every progressive movement of the age, welcoming knowledge in every shape, and furthering it as few in this

century have done, by throwing open to the wide world the accumulated treasures of the Vatican library; offering, finally, in his person a rare, not to say a unique, combination, of the deep-read scholar, the able statesman and the zealous pastor of souls.

To the end he continued his life of incredible activity, receiving each day the heads of administrative departments for the transaction of business, never allowing anything of importance to be done without taking personal cognizance of it, reserving to himself questions of especial delicacy, giving audiences public and private, and astonishing those who approached him by his familiar and seemingly universal knowledge of religious and secular affairs all over the world. He was wont to continue in the night the unfinished work of the day, sleeping little and knowing no relaxation outside a short talk with his familiars and the occasional writing of a Latin poem, an occupation he had ever enjoyed from his boyhood.

The hour of rest came at length and Leo, the man of broad mind and broader charity, departed, leaving to the Church he had so wisely guided a legacy of peace and good will toward all men.

At the close of a bright day on the ocean, voyagers love to watch the sun as he touches the horizon and slowly sinks behind its waters. So have we watched this great and good man as he neared the term of his lengthened course and finally disappeared, and our common prayer, as we sadly turn away, is that the race of such men should never disappear from among us.

The Royal Stairway of the Vatican

Souvenirs of Leo XIII

By the Marchioness of Wentworth

[The Marchioness of Wentworth, known in art as Cecilia Wentworth, is an American by birth, but has resided for many years in Paris, where she has exhibited at the annual Salon and taken several honors. She generally paints religious subjects, and a few years ago the French Government bought one of these for the Luxembourg Gallery. Mrs. Wentworth is also successful in portrait painting, and is now engaged on an excellent full-length likeness of the late John W. Mackay.—EDITOR.]

OF all my portraits, that of His Holiness, the late Pope, is the one in which I take the most pride. Cardinal Ferrata, when Papal Nuncio to Paris eight or ten years ago, was twice painted by me. The late Cardinal Ledóchowski, the head of the Propaganda, was a good friend of Archbishop Corrigan, who was also my friend. Princess Viana Altieri, whose daughter married the nephew of Cardinal Rampolla, the Secretary of State of the Vatican, has always taken much interest in my art work. It was to these three important personages that I owed my being given the opportunity to paint the portrait of the Holy Father.

I spent two winters in Rome in connection with this task. I had my first sitting in the autumn of 1897. It was in the Pope's general reception room that Leo XIII appeared before me in this new role. "Why didn't your good husband come to Rome, too?" were the kindly words with which he greeted me on that morning, so memorable in my life as an artist. He sat and stood and conversed. This first sitting was short, but it was long enough for me to get

the necessary initial impressions, to decide what the general character of the portrait should be, and to receive the inspiration which is the soul of all worthy art. Leo XIII had a way of strightening himself up—but only for a moment—every now and then to his full height, when he rose to six feet. At such an

instant he was so majestic and ennobled that I was almost inclined to paint him seven feet high. This habit of assuming an erect position for a few seconds, which was no ordinary exertion for a man of his great age who was always bent, the Pope used with much effect on public occasions and it always produced a deep impression on those who witnessed it.

Leo XIII had a most attractive personality. I was drawn to him not simply because I was a Catholic and he the grand head of the Church. He bubbled over with humor and genuine wit.

He was wonderfully quick at repartee. When my portrait, which was exhibited at the Paris International Exhibition of 1900, finally reached Rome and was borne to the Vatican, by order of His Holiness, by a van and eight men, I was, of course, sent for, and on that occasion

The Wentworth Portrait of Leo XIII

I enjoyed my most intimate audience of the Pope. I was quite alone with him for three-quarters of an hour, and then came out more strongly than ever the personal characteristics which I had observed before, but never so clearly, of this truly extraordinary being. Speaking in French, which tongue he knew so well how to use, the Pope welcomed me with these words that went right to my artist's heart: "How well done! Everybody else has painted me as an old man. But you have put youth into my aged frame." "We artists paint as we feel," I answered. "Tell me what I can do for you and speak to me about America," he continued. "American Protestants admire you," I said, among other things, "and American Catholics adore you." Patting me on the cheeks, he answered, "My child, you always speak with *esprit*."

During this audience and all through the conversation, of which I give only a few detached portions, His Holiness sat with one hand behind him, evidently holding something out of my view. Finally he said with a good natured, quizzical expression in his noble face: "Guess what I have here for you." Then he advanced the hand a little, but quickly thrust it back again behind him. For a minute or two he continued to tease me as if I were a child, evidently enjoying my perplexity. Then, suddenly opening a kid-covered box, with the Papal coat-of-arms stamped upon it, he dazzled my eyes with a beautiful chaplet made of topaz and gold, the gems so pure and cold and the metal so yellow and heavy. "I selected this one for you from several brought to me," he remarked, quietly, blessed it and handed it to me.

My impression of the late Pope, gained after several interviews with him, both public and private, might be summed up in these words. Leo XIII possessed marked finesse and was a diplomat down to his delicate finger tips. No ambas-

sador—and I have seen many—was ever his equal in all that goes to make up a great diplomatist. Like all superior men, he had a strong character. Nobody I have known made such a deep impression on me. His intellect was evidently of the first order. A five minutes' conversation with him put this beyond question. His eyes were wonderful. They were like the Roentgen rays. They were so piercing, that they went right through you. In his presence you felt that you could only tell him the truth. "It is not difficult for your Holiness to read my thoughts," I once said to him. He was exceedingly frank, and it was easy, in turn, to open your heart to him. There was a point to everything he said, and he could put more into a sentence than many people fail to get into a paragraph. How like him those last words to one of his favorite Cardinals, mentioned at the beginning of these random recollections: "Oh, Ferrata, farewell; I leave for eternity." His elocution was refined and his delivery polished. When he pronounced the words, "Ave Maria," he threw more feeling into them than any other priest I ever listened to. Pathos was a power which he employed with a master's talent.

He managed everything. Even Rappolla decided nothing without consulting him. He was at home in letters and politics alike. He never asked for aid, but preferred standing alone, positively and figuratively. I well remember how on one occasion, when he was celebrating mass, a cardinal who was aiding him came to his assistance when the aged Pontiff seem too weak to go on to the end of the ceremony. But the movement of the back and shoulders plainly showed that the help was not only declined, but that it was displeasing. His motto was these words, which he wrote some years ago at the bottom of a fine photograph of himself which he gave me:

Beati qui ambulant in lege Domini.

PARIS, FRANCE.

The Mysteries of Fakirdom

[Behind the mask of a diffident anonymity the writer of this article remarks to his readers that they have often talked with him, as a chance acquaintance on train or steamer. It is probable he, and scores of men of whose class he is conspicuously the type, have sought to force acquaintance with those very readers upon some city streets—New York or Baltimore, Chicago or San Francisco, according to their progress in an itinerary of which the only guides were the credulity of the populace and the complaisance of the police. The Fakir's narrative, less edifying than instructive, is less instructive with regard to his adventures than with regard to the tone of municipal police forces. The methods of Fakirdom so often cross the line of bald swindling and, at times, of larceny, that the responsibility for its suppression by city authorities has been almost universally recognized. The manner in which the authorities of the various large cities, that are referred to in the course of the article, hold the candle to the devil, might serve as food for sober reflection on the part of those who hold and exercise the right of franchise.—EDITOR.]

TWO reasons and a train of circumstances made me a fakir. One reason was my lack of education; the other, a not very robust physique. I could not earn a good living solely by the exercise of my untrained intelligence, and I could not hold a position requiring physical strength. The circumstances which led to my taking up the life of what I call an itinerant merchant were due to a series of uncomfortable reflections on my part, accentuated by my discharge from a not too lucrative position as a collector for a small installment house.

As I walked home that Saturday night I paused at a corner where a man was talking volubly to a crowd of people, in his endeavor to sell them patent knife sharpeners. I noticed that he wore good clothes; his person indicated prosperity; there was no sign of hard work apparent in him. That night, after he had closed up his grip, I followed him to the hotel where he was staying and managed to enter into conversation.

When I left the hotel I was a fakir. On the following Monday I purchased from him all the knife sharpeners that \$3—my available capital—would buy, bought a ticket to a town twenty miles distant and, with him, launched myself in the business which I have been following for fifteen years.

"Now, Sonny," said my tutor, "this town's open. You don't need any reader—license. All you have to do is watch my oration. Beat it if you can; and then paddle your own canoe."

We opened our tray on the main street and vociferated until we drew a crowd together. Soon I was making mental

notes of his lies, and seeking to improve on them, as rival department stores do in their advertisements. The sharpeners cost me three cents apiece; all were sold in that one town, for twenty-five cents each; and I had not even strained my voice in doing it. Then and there I made up my mind that it would be a shame for me to deprive any one of the opportunity of working hard. I have never taken the bread from any hard working man's mouth by asking for his position. I remained true to those knife sharpeners for a long time; and, in fact, they are to-day a stand by for all fakirdom.

My initiation into the craft of the fakirs was a matter of no further trouble. But, as a neophyte needing experience, I was advised by all the old timers to go to Chicago, and there, in honorable strife, win my spurs. I thought in my simplicity I had about all of the business learned, but when I left Chicago I confessed to myself that I really had known next to nothing of its mysteries.

Chicago is the only "square" town in this country—that is, "square" from a fakir's or grafter's point of view. You pay for protection; and you get it.

"Have you squared yourself?"

A policeman asked me that question on the morning of the day in which I made my first "pitch" in Chicago's streets.

I told him no. He gave me the direction to the station house, where I was to see the Police Captain. When I left the station house my roll of bills was smaller by one, whose denomination was \$5; and I had nothing but the verbal assurance of the Captain that "things would be all right for a week."

"And, look here, young man," he added, "just try to stick to the sharpeners. Don't you 'jam' or work 'slum' without paying the regular tariff. Its \$10 per day for jamming and \$5 for slum. Remember that."

I squared the policeman at the rate of about a dollar per day for drink money and had no trouble. It was a strictly honorable and satisfactory arrangement. There are towns not a hundred miles from New York where the police will take all the money that you can be made to give them and then arrest you.

I became acquainted there with a few fakirs who had returned from a trip through Indiana and Ohio; but the way they spent money made them too fast company for me. I thought myself as shrewd as they, and I determined to learn how they made a hundred dollars while I was earning only ten. A gaining of their confidence initiated me into the mysteries of "graft," a generic term for getting other people's money without giving anything in return—largely applicable to Wall Street, I think, altho, of course, Wall Street has another name for it. It was explained to me that "slum" was a term for anything which might be placed in packages, including jewelry, handkerchiefs and other small articles. The "main stem" of a town is its main street. "Jamming" is a slang phrase which requires some explanation. To those who have had an ocular demonstration it will be easier when describing the event to revert to a tense of the verb and say one was "jammed."

The first thing to be done when "jamming" is the order is to "see" the police. Next, hire a good horse and an open carriage. The stock in trade usually consists of some package of harmless medicine, worth about two cents. The "pitch"—so-called because the fakir erects his stand as showmen pitch tents—is made. And the man who is to do the talking, which is called the "spiel," begins his remarks.

"Now then, gentlemen, I am going to present to your notice to-night the world renowned vegetable cure for most of the ills which mankind is subject to. This cure will not plant your seed, nor will it grow your crops, neither will it teach you algebra and the dead lan-

guages. It will do everything which it is guaranteed to; and the firm which manufactures it is going to give the representative citizens of this town an opportunity to secure it for to-night only free of charge."

The "representative citizen" business gets them feeling good, but when the talk of free distribution comes in the crowd loses all its diffidence immediately.

"We are going to give this medicine to men of substance, only; and I am going to ask each of you neighbors to give me a quarter for the package and then I will return your money."

As the quarters come in they are handed back with the medicine, but only a few individuals are allowed to purchase.

"Now I am going to increase the price to a dollar and give you your money back."

A few dollars come in; and they, too, are returned with the medicine.

"Here comes the most unprecedented offer ever made; to those who give me five dollars I will make a present this time which is of value."

As the money comes in each donor is handed the medicine and a small package of cheap jewelry. He is told to stand near the wagon and await the distribution of the additional present. The "spieler" gives a quick glance toward the driver. There has been no mention of the money being returned, but the crowd infers that it will be.

"All right, Jim," he yells.

A cut of the whip, two figures crouching in the bottom of the carriage and clutching revolvers in their hands, and that crowd has lost all told \$500. At least, that was the amount the fakirs secured the first time I was introduced to "jamming."

Of course, it is not very safe to operate in that town for some time to come; but there exists a sort of free masonry among fakirs, and the towns which have recently been the sufferers from sharp practices are placed on the black list.

I determined to work my way back East, after having taken my post graduate course. My first stop on the way from Chicago was made in Cleveland. The town was known as "closed," but the understanding was that a liberal fee

to the police would insure freedom from molestation. I paid what was asked of me and, having picked out a suitable location, commenced doing business with "slum" and "working high," which means that I stood on a box. Working "low," of course, means working on the level—that is, the street level.

The crowd was an avaricious one, and I had to place eight or ten handkerchiefs in a package, with two or three pieces of cheap jewelry, before they would give me ten cents for them. I did not count the handkerchiefs. Each time that I said "Here's another one" I dropped a corresponding one from the back of my hand into the pile which lay in my box. They *thought* they were getting something for nothing; and I find that all successful business men adopt that method of treatment to their customers.

I had taken in a few dollars and things were looking bright for a good day's business, when I was told to close up.

It was a plain clothes man who ordered me to cease work. I thought he did not know that I had been to police headquarters, so I told him it was all right, that I had squared myself.

"Squared nothin'," he said. "This town's closed, an' you know it. Git along."

I told him I'd be hanged first. I had given up \$5 of good money and I did not propose to be buncoed by him or any other "flatty," as we termed plain clothes men. He arrested me. I knew better than to make any protest when I was tried; if I had Cleveland would have never seen more of me—the police would not have allowed me to get out of the Union Station. I paid my fine, and learned the lesson that no matter how small your "graft," the police are willing to take all you can earn and then turn virtuous.

That Mecca of all good men and great—New York—had never received any attention from me. I determined immediately after my experience in Cleveland to make a bee line for the largest city in the United States.

I knew that the town was closed, save for the fifteen days preceding Christmas; but I knew also that there was much money to be picked up by an energetic fakir in the half hour "sneak" pitches, which can be made between the

coming and going of the roundsman if one is careful to "see" the policeman on beat first.

New York is certainly the easiest city in this country. The majority of its citizens bound the world by the Battery, Harlem, the East and the North rivers; deck themselves with sagacious complacency, and buy more gold bricks than all the world put together. And yet I, too, think New York is great.

But the police—they are impossible. Long before New York even toyed with reform its police could not be trusted. My knowledge was gained at the corner of Nassau and Ann Streets, after I took in more money, in a half hour's time, than I ever earned before or since.

I was, as usual, appealing to the cupidity of the crowd, and was wrapping bills of various denominations around small pieces of soap, placing the soap in a box, and giving the crowd a chance to take away my money for 50 cents per opportunity. I had given the policeman on the beat a dollar. But when he saw the money rolling in compassion for his fellow citizens, or professional jealousy, moved him to dart across Ann Street and try to catch hold of me. I thought some of his superiors had appeared in sight and that he was only feigning. So, closing my satchel, I broke through the crowd and ran toward Park Row. I was surprised when I turned around to find the policeman was in the act of reaching for my collar. I let him take hold of me. Then I asked him to tell me what was the matter. The way that man talked to me was a shame. Before he reached the station house I began to think I was the most hardened criminal in the world, and my captor a very Cerberus.

The usual fine was imposed the next morning. But never, since then, has the treasury of New York been enriched by any of my money, nor has any other policeman had his salary augmented at my expense. I find it safer to hire look-outs, albeit more expensive.

Philadelphia came next on my list of unexplored cities. Philadelphia is also on the list of closed cities; but it is easily opened. It is the cheapest city in the United States. The policemen are paid at the rate of \$1.75 per day, and a fakir

who gives one of them a quarter for protection is hailed as a Carnegie. For a dollar a day, the guardian of the beat you are working on will keep your territory clear of other fakirs and vote you prince of good fellows.

There is not much money to be made in Philadelphia by a fakir, for various reasons; first, the people have an inherited trait of thriftiness; second, they live their lives less feverishly than in any other large city of the United States; and there are "home guards" in the town who take care of all the surplus cash floating around; so that the stranger who seeks to prey on Philadelphians must confine his efforts to disposing of something which will net him not more than 500 per cent. profit.

I always manage to spend a month in each year in Philadelphia, not for the profit particularly, but mainly for the nerve tonic I get from the restful life there. Pittsburg is different. There is money in abundance in that town, and I have had the pleasure of assisting at the partition of several large packages of its cash, but not of late. Reform and counter reform have placed the police of Pittsburg in such a state that they are afraid to trust even themselves. I have heard that they look over their money on pay days with a microscope, for fear that some of their bills might be marked. I do not worry about things like that, however; I have seen reform attack cities before, and the disease is not severe enough to even leave a scar. It is only the fakirs and grafters without experience who growl at the present and long for the good old times; and it is only the politician of yesterday who bemoans the loss of his silver, green or golden lined cloud when the reform storm sweeps it out of sight.

The big cities are not the only ones to receive attention from the fakirs. During one period of about two years which I passed in the Eastern States, I never did a stroke of business in a town of more than seventy-five thousand inhabitants. There is a lot of money in the manufacturing towns of the East, but the police will not permit anything but "straight" work. While the returns from the legitimate sale of a fakir's stock are sure they are, to me, slow. I can

figure on making \$10 a day clear with almost anything that is portable.

New York and Chicago are the headquarters for new novelties, and it is the fakirs of the first class who secure the new things. The men who are satisfied with two or three dollars per day come in at the fag end. We keep in touch with the novelty supply companies for new things, and scan the papers constantly for announcements which indicate some unusual event that is calculated to draw a crowd. I never travel with less than two trunks; and if I find a fakir working in the same town I always give him the right of way with his goods and sell something else.

I think that, for straight faking, aluminum gas tips were the most profitable things I ever handled. They cost me, with the brass pillar attached, \$1.35 per gross. I laid out \$500 in tips and printed matter, planned my campaign, and began an intinerary which occupied four months of my time. My bank account showed a balance to my favor just \$4,527 in excess when I had completed my tour.

I had my circulars distributed in every place of business in the town upon my arrival. Then I called, presented my card and, while talking, hurriedly estimated the number of gas jets in use. I impressed my man with the fact that I was only advertising for the manufacturers, and was not allowed to place more than a dozen tips in one place. If I saw two dozen jets, I told him two dozen was the limit. I had each tip stuffed with cotton, but I told the victim that inside the pillar there was a regulator, an asbestos screen, and any other mechanical contrivance not too bulky to need a separate building for installation. He usually believed me. I called his attention to the printed price on the circular—35 cents; and as a favor, just for an advertisement, I would sell the required number to him for 25 cents each. If he wavered, I quickly placed a tip on his gas fixture, lighted the gas and gave him an ocular demonstration. As a final, impressive argument, I would pass a newspaper *behind* the light and show him how easy it was to read *through* the flame. That settled it. I never failed to make a sale. But while I was expatiating on the beautiful light given I did not

tell that it was produced at the expense of increased gas flow, nor did I explain that you can read a newspaper through any gas flame. I suppose there are a number of salesmen who can charge up to their consciences similar sins of omission.

I have had offers from firms to enter their employ in the capacity of traveling salesman at a salary larger than I average and with none of the attendant risks, but I would not work for any living man. I would rather be my own master for considerably less money than I make now; and there are a good many men who are of my way of thinking.

The fakir is usually supposed to be a hardened product of depraved nature. But I know a number of the craft who,

like myself, prefer ice cream to whisky, and a good book to a game of poker. Not that I never play cards; I often do, but never for pleasure. When I sit in a game I know what the others are holding—and I get their money.

It is very seldom that I eat breakfast before eleven o'clock, and not often that my day's work is not done in four hours. The rest of the time I spend at the theater, at some sporting event or in my room reading. I dress well and know how to conduct myself like a gentleman. you have often talked to me, as a chance acquaintance in trains and steamers. Usually your impression has been that I am very well acquainted with the United States and able to talk intelligently on national and general subjects.

The True Negro Music and Its Decline

By Jeannette Robinson Murphy

[Mrs. Murphy is, of course, a Southerner. She has therefore been familiar with the negro from childhood. During the past few years she has earned an enviable reputation as a portrayer of negro music and character before Northern audiences, and those of us who have heard her would not hesitate to accord her the very foremost rank of negro folk lorists.—EDITOR.]

SOME day we who are so fortunate as to have been rocked to sleep on the broad, tender bosoms of old black mammies will be the envy of our great-grandchildren. There is a danger that they will clamor in vain for truthful representation of those old days when loving black tyrants ruled and reigned over their broods of white nurslings, and claimed, with the mothers, the hearts and fealty of their confiding charges. These trustworthy old retainers, but a few years ago so universally known and loved throughout our great Southland, are rapidly being replaced by a far less worthy class, and, with them, their quaint customs are fast disappearing and their soul-stirring songs becoming obsolete. It would seem that we of this generation owe it to posterity to see that the genuine African music be handed down in all its purity.

Many people in America to-day, not discerning the wealth and beauty of the

true negro songs, not only tolerate the manufactured "coon songs," but fail to recognize their spurious quality, and permit these attempted imitations with which the country is flooded to pass unchallenged as the true article. Even poets of the colored race are adding to this great wrong, and are creating a false, flippant new song to be put into the mouths of a guiltless people.

There are writers whose vaporings attract attention, and who think nothing of composing so-called negro songs and passing them off on a credulous public, confident that their careless readers cannot tell the counterfeit from the genuine music.

The only plan which will effectually preserve the old slave music in all its beauty, its power, its quaint and irresistible swing will be for the negroes themselves, by the aid of skilled annotists, by phonographs and by every art available, to awaken to the real value of this won-

derful music. They alone can work in every corner of the unique and varied field, creating a new interest among their race alike in their camp meeting "spirituals," the crooning lullabies of the nursery and the roustabout songs of the river.

The sporadic efforts of a few far seeing negroes will avail little. The negro preachers over the entire South should be encouraged to lead in this grand work. Our judicious praise of their "spirituals" might do much to prolong their life, but without united effort on our part

looking to that end, and an increased interest and desire on theirs to sing those songs, they must surely die. Their songs, which need no instrumental aid of any kind, are even now, in our iconoclastic cities, being supplanted by hymns from regular English hymn books, to the accompaniment of an organ—an innovation to be deplored, since this new singing is not to be compared in heart power to their own spontaneous outpourings.

There never yet has been a song which could touch the heart more in evangelistic meetings than their beautiful "Prod-

1. Oh, de Prod - i - gal Son he left home, By him -

self,.... by him - self,.... Oh de Prod - i - gal Son he left

home, Oh de prod - i - gal son he left home, by.... him - self.

- 2 Fadder, gib me ma portion ob goods, by myself, by myself,
Fadder, gib me ma portion ob ma goods,
Fadder gib me ma portion ob goods, by myself.
- 3 And I'll go into de country, by myself, by myself,
And I'll go into de country,
And I'll go into de country, by myself.
- 4 An' he wasted all he libben, by himself, by himself,
An' he wasted all he libben,
An' he wasted all he libben, by himself.
- 5 An' de Produgal Son he got hungry, by himself, by himself,
An' de Produgal Son he got hungry,
An' de Produgal Son he got hungry, by himself.
- 6 An' de Produgal Son returned, by himself, by himself,
An' de Produgal Son returned,
An' de Produgal Son returned, by himself.
- 7 Wid no shoes upon his feet, by himself, by himself,
Wid no coat upon his back,
Wid no hat upon his head, by himself.
- 8 An' de Produgal Son made merry, by himself, by himself,
An' de Produgal Son made merry,
An' de Produgal Son made merry, by himself.
- 9 Wid de shoes upon his feet, by himself, by himself,
An' dey put de rings on his fingers,
An' dey killed de fatted calf, by himself.
- 10 An' dey crucified my Jesus, by himself, by himself,
An' dey crucified my Jesus,
An' dey crucified my Jesus, by himself.
- * 11 An' de Produgal Son was lonely, by himself, by himself,
An' my Jesus Him was lonely,
An' de Christian him an lonely, by himself.

* If the leading singer is in a hurry, he will sing three verses in one. This song has an unlimited number of verses.

igal Son," with its winding, appealing measures and soul-satisfying, plaintive words, words which tell out the whole beautiful Bible story. In this song alone there are sometimes rendered fully one hundred different verses, all used, it would seem, according to the mood and the inspiration of the leading singer.

This "spiritual," like all of their others, is sung differently in every locality, and furthermore, no negro ever sings the same song twice in just the same way.

The version of "The Prodigal Son,"

singers hit any note that comes easiest, and the great chorus of worshipers gloriously join in with them, singing the remainder of the tune in a higher or a lower key, generally a higher.

This song has no refrain, which is a rarity, for most of their "spirituals" have very stirring and plaintive refrains.

In the fascinating "Sinners, Yer Walkin' on er Slender Stran'," the words and melody are used for the body of the song and also for the refrain, the words to the first verse being repeated for the latter. (See below.)

1. Sin-nah! yer walk-in' on er slen-der stran' Shall I....

die?.... Sin-nah! yer walk-in' on er slen-der stran',

shall I..... die? Sin-nah! yer walk-in' on er slen-der

Ritard.

stran', Shall I.... die? Mos-ter Je-sus, yer made so sweet.

- 2 Wretched man! yer walkin' on er slender stran', etc.
- 3 Backslider man! yer walkin' on er slender stran', etc.
- 4 Mourner man! yer walkin' on er slender stran', etc.

as reproduced on page 1724, is the one generally used at Georgia camp meetings.

All of their hymns lose immeasurably by being taken out of their original settings in the churches and sung as solos, and yet even in this form they produce a miraculous effect upon the emotions of both the learned and the ignorant.

There is a weird, savage "shout," where the same line is repeated four times, as is evidenced in the song, "Ole Ship O' Zion," on page 1725.

The chief beauty in this song seems to lie in getting off the key in each verse. The congregation, as a body, is incapable after the leader sings alone the first verse of getting a secure hold of the difficult diminished seventh occurring in the note used to the first syllable of the word "Zion" in the first line, so the leading

The old aunties say that these songs are so "filled wid de Holy Sperit" that they forget they are working if they just keep singing all the time. No Southerner ever doubts the truth of this statement.

It is quite the fashion among learned Northern men to call this imported African music "the only folk music of America." Why should we not with equal justice call the transplanted Scotch, Irish and the music of other races our American music?

These melodies certainly were brought by the negroes from the Dark Continent along with the customs and traditions and sickening voodooism which are surviving here to-day.

To the majority of people the mention of a negro song brings up instantly visions of "I Want Yer, Ma Honey," or

"Alabama Coon," or even the lovely "Suwannee River" and "Old Kentucky Home"—all written by white people who are not so constructed mentally as to be able to write a genuine negro song. Some of these imitations are indeed fetching, but it is to be hoped that none

unappreciated negro "spirituals" for fully one-fifth of its contents. The memory and knowledge of the Bible among the negroes of the old school are simply miraculous.

Way down in Kentucky was an old uncle whom every one respected. He was

of them will survive to work further havoc with the truth.

In questioning great numbers of ex-slaves I have yet to find one who does not implicitly believe that God himself inspired the words of all their religious hymns. If by any miracle the Bible were lost to us to-day we could look to these

a great singer, and seemed to know, as thousands of them do, countless numbers of these wonderful songs by heart. When asked about the origin of this great and heart reviving music, which does seem to be so imbued with the power of the Holy Spirit, he answered me as follows: "Us old heads used ter make 'em

up on de spurn ob de moment after we wrastled wid de Spirit and come 'thoo,' but de tunes was brung from Africky by our own granddaddies. Dey is jis miliair (merely ear) songs. Dese days dey calls 'em ballotts, but in de old days dey calls 'em 'spirituals,' honey, case de Holy Sperit done taught 'em ter us. Some finks Moss' Jesus taught 'em, an' I'se seed 'em start me myself in de meetin'. We'd all be at de 'Prayers' House' on de Lawd's Day an' de white preacher, he'd be hired ter 'splain de Word, and he read whar Moss' Zekiel done say 'dry bones gwine er lib ergin,' or 'Daniel in de lion's den' and 'Chile ob Grace;' de Lawd would come a-shinin' thoo' dem pages an' revibe dis old nigger's heart, an' I'd jump up dar and den and holler and shout and sing and pray, and dey would all cotch de words, an' I'd sing it ter some old shout song or war song I'd heard 'em sing fum Africky, and dey'd

see comin' 'long now ain't wuth killin' fer dey don't keer 'bout de Bible nor de old hymns nor nuffin. Dey 'pletely spiled wid de white blood an' de eddication an' de big orgin an' de white folks' hymn books, till it done tuk all de Holy Sperit outen 'em. Dey ain't no better dese days, wid dere dancin' an' singin' an' cuttin' up dan de shoutin' Mefodist white folks is." (See song on page 1727.)

The negro by some mysterious power does not take a breath at the end of a line or verse, but carries over his breath from line to line and from verse to verse at the imminent risk of bursting a blood vessel. He holds on to one note till he has a firm hold of the next one, and then besides he turns every monosyllabic word into two syllables and places the accent where it does not belong, on the last half of the word. An instance is given immediately below where the voice swings downward a whole octave on the word "yes."

1. Ready fo' de wa - ter? Oh, yes! Ready fo' de wa - ter? Oh, yes!
2. Dis my son? Oh, yes! Dis my son? Oh, yes!
3. Whom I am? Oh, yes! Whom I am? Oh, yes!
4. One more candi - date? Oh, yes! One more candi - date? Oh, yes!
5. Here goes de babe! Oh, yes! Here goes de babe! Oh, yes!
6. Been bap - tized? Oh, yes! Done lef' de world? Oh, yes!
7. He dat keeps— Oh, yes! He dat keeps— Oh, yes!
8. Shall I hab everlast-in? Oh, yes! Shall I hab everlast-in? Oh, yes!

- | | |

all take up de tune an' keep long at it, an' each time dey sing it dey keep a-addin' mo' an' mo' verses ter it, an' den dar it would jis natchully be a 'spiritual.' Dese 'spirituals' am de purtiest moanin' music in de whole world, case dey is de whole Bible sung out and out. Notes is good nuff fer you people, but us likes a mixtery. Dese young ladies what we

With great ecstasy they throw their whole souls and bodies into the singing of each hymn, and seem carried away for the time being by the potent spell which each song casts over one and all.

A marked peculiarity of the negro singing is that very often in the heat of their religious fervor they will repeat again and again the same verses.

In studying this music one finds that each verse is usually composed of one statement, frequently a crude attempt at a Bible quotation, repeated three times. Occasionally, however, the same line is repeated but twice at the beginning and again as a last line to each stanza. An instance of this exception occurs in the hymn,

'I Don't Want er be Buried in de Storm.'

in these there is pretty apt to be a change into the major key before the hymn is finished.

Many Northern people think that if they say "Lordy Massa," letting the voice rise at the end, they have made great strides in mastering the negro dialect. There cannot be found many examples of the employment of this rising inflection either in speech or in song.

Aint but one Gawd sabe us all.—REF.

NOTE.—Frequently sung while washing windows.

Since this hymn is not infrequently employed by servants while washing windows, an interested listener has a fine opportunity to catch every syllable and typical quirk, for we all know that the negro servant, if left alone to "sing and git happy," will occupy an hour or more in the cleaning of a single window.

It is often stated that there is a continuous note of sadness running through all the negro music, and that the songs are usually in minor keys. I should say, on the contrary, that the majority of them are in the major keys, and that there is a ring of jollity, wild abandon and universal happiness in most of them. There are doleful passages occurring occasionally, and some sad minor songs, but even

This seems to be characteristic of the Irish race, while, on the contrary, we find the old aunties and uncles repeatedly dropping the voice even two octaves. An example of this is given on page 1730, in that most fascinating of all their lullabies, "A Christmas Song."

"Mary, What Yer Gwine er Name Dat Purty Leetle Baby?"

The old mammy did not quite understand the meaning of that verse in Isaiah (9, 6) where he says: "And the government shall be upon his shoulder." So she reasons it out that some one is riding the baby Jesus on her shoulders and "calling Him dare Governor." It is a pretty conceit, the way she carries out the whole touching song.

We can easily imagine inquisitive shepherds and adoring wise men asking the Virgin Mary what she intends to name her precious little baby. We can see her hesitate, since she had been told he was to be called "Jesus," "Son of God" and also "Son of the Highest." So the mammy thinks, with all these prophecies concerning the naming of the baby, it must be finally left with the

They surely must have some occult telepathy among them, for they never make mistakes—viz., some singing one verse and some another.

The old slave loved best the miraculous points and dramatic passages in the Bible, and if the negro could be trained along his natural lines, and his race blood kept perfectly pure, there would come some day from this people one of the

Glory be to my new-bawn King!—REF.

N. B.—Note two peculiarities of negro hymnology; viz. the repetition of the same line three times, and the occasional transposition of a few bars to a lower or higher octave.

Blessed Mary to decide. The negroes will sing a great many answers to this most natural question, giving the innumerable names by which the Son of God was called until the satisfactory name is reached, which distinguishes Christianity from all ther religions.

They all seem to know by the most wonderful instinct every "spiritual" which was ever born. Let a colored stranger from Kentucky go to a Louisiana church and begin to sing a new song; none of those present may ever have heard this song, and yet in a few moments they are all singing and patting it like mad, and the most singular, inexplicable thing about it is that each member of the congregation seems to know almost to a man as quickly as the singer himself exactly what words he is going to sing. No "lining out" is ever practiced in their singing; only with the "hymn book hymns" is this quaint custom followed.

greatest orators, one of the greatest actors, one of the greatest romance writers, and surely the very greatest musician who ever lived.

But side by side with the too highly civilized white race the negro must in time have eliminated from him all his God-given best instincts and so fail utterly. For are they not already ashamed in our large cities of their old African music? They should be taught that slavery, with its occasional abuses, was simply a valuable training in their evolution from savagery, and not look upon their bondage and their slave music with shame. For during that period these songs could develop *because* the negro was kept in such perfect segregation, and his instincts and talents had full play. He received *then* those things which he needed *most*—viz., work for his hands and God's revealed Word for his heart and mind.

Reminiscences of Washington Before the War

By Grace Greenwood

AMONG our occasional guests at the Bailey receptions were two outside Americans, remarkable for literary talent, and one foreigner, remarkable for the same quality and for other things too numerous to mention. The first was George D. Prentice, of Kentucky, a brilliant journalist, and one of the wittiest and most genial men I have ever known. Political journalism, tho not so fast and furious as that of to-day, had its wits and satirists of no mean caliber,—men conscious of their power, yet not bursting with their importance, as national jesters. They had no need to call on the caricaturist in producing their humorous effects, which were all the more effective for being somewhat sparse and intermittent. Who can have appetite and digestion for chunks of fun served up every morning, or evening, or Sabbath day? The second of these friendly aliens was Moncure D. Conway, a young Virginian slaveholder, who had worked out his own salvation if not with "fear and trembling," with deep conviction and splendid consistency; manumitted his slaves, and thereby stricken shackles from his own soul. Many lives, both at home and abroad, have been the freer and richer for the noble labor which has graced his life. In his own State at the time he was accounted a dangerous innovator for his resolve to disembarass himself of his human chattels, without counting their money value, or calling in the aid of the auctioneer, but disposing of them by the simple process of giving them away to themselves. He saw his work before him, and bravely proceeded to do it without waiting for the Lord and Abraham Lincoln to do it for him. The third distinguished visitor was one Count Gurowski, a Pole, who came to Washington from Cambridge, where he had been taken up by the whole Harvard set, being wonderfully well informed and accomplished, but an eccentric and rather mysterious personage.

At that time, and through years before and after, every distinguished

foreigner or aspirant for distinction seemed immediately, on landing in America, to take a bee-line for Craigie House. Mr. Longfellow was the most besieged literary man of his time. He might as well have been a Congressman from Ohio. He had nothing in his manner, when most cruelly beset and bored, of the still, icy *hauteur* of Lowell, of the determined shyness of Whittier, or the smiling, hurried, "just-going-out-can't-stop" air of Holmes, for his defense; he suffered, but he endured to the end of the stranger's unconscionable visit, but in his diary, like the dove in the song, he "mourned, and mourned, and mourned." Count Gurowski, whom he refers to as "the terrible Count," was a Panslavist, with a theory that all the Slavs should be gathered within the embracing paws of the Russian Bear. But the Poles generally disowned him, and he seemed not to be *persona grata* at St. Petersburg, tho his sister was Lady in Waiting to the Empress. This sister was said to send him the remittances which enabled him to live like a gentleman. After spending a few years in America, he wrote a big book, and it was grave, and solid, and surprisingly inoffensive, considering that he was a very brusque, cynical and conceited foreigner. Like many Slavs, he was a remarkable linguist, speaking English especially well. He was elegant in his dress, and said to be unexceptionable in his habits and morals; yet was not liked, partly because of an overpowering egotism. Many suspected him of being a Russian emissary, set to spy on the Hungarians, as he was evidently inimical to Kossuth; at least he amused himself greatly with our enthusiasm for that romantic hero of a grand unsuccess. I remember well how at mention of the Magyar's name a scathing flash of irony would leap from his one, dark eye (the mate had been picked out in a duel), and he would pour forth a perfect flood of mocking words, half jest, half earnest, ending by grasping his head in his hands and exclaiming

"Ouf!" a pleasant little habit of his. I quarreled with him, of course, and we had many a round on the Hungarian question. He amused me, and I even claimed that he was handsome, when one got on the right side of him. One of the household given to punning declared him to be my "one-eye-dear," and all more or less jeered at me for harboring a Russian spy in my heart; but when his book "America and Europe" came out, being a volume of four hundred pages, it accounted for his time, allowing none for detective work. It was particularly fair and square on the slavery question, and courageously advanced a hope for the future of the American negro, whose fortunes were then at the lowest ebb.

Nothing stirred up "the terrible Count" like a fresh manifestation of the Kossuth mania. He sneered at every new honor bestowed on our guest, from the formal reception in the Senate Chamber to the Congressional Banquet, over which Webster presided, his "face of infinite woes" temporarily lightened and brightened by the sympathetic enthusiasm of a great orator. It was noticed that after many proofs of the Compromise measures, for which he had paid so dearly, having failed, there was a deepening of the Dantean gloom of Webster's face. In his last great speech—that before the New York Historical Society—all the dreadful apprehensions of his soul took form in warnings of the perils dark and dire which menaced the Union. There was to me something so singular and uncanny about his flaming prophecies that I wrote of them at the time:

"Can it be that these, to us, gigantic phantoms are monstrous realities to his prophetic vision? That wherever he goes, in lofty halls of State, or gay social banquets, dread portents flame and black chasms yawn about him? That his lugubrious muse, whom we sometimes smile at as half distraught, is in truth an inspired Cassandra, foreseeing with wild, gloomy eyes the abandonment of our central citadel of power, the conflagration of our lofty political structures—tower after tower rocking and falling in the red devouring flames of discord and disunion?"

Not all of the tremendous tragedy he pictured has yet been enacted, but, as Mercutio says of his wound, "it is

enough." Back to Kossuth: The finest speech for intervention was given by Senator Soulé, of Louisiana. I venture to quote from my notes of his speech a sentence or two which seem to me singularly applicable to political questions of our day:

"There are those who apprehend danger from the influence which may be exercised over our future destinies by the doctrines which have been lately and are still proclaimed by that inspired missionary of freedom, and who presume that it may be in their power, through the negative virtue of a dissenting vote, to stem the torrent of wild wisdom which is now flooding the land. Let me tell them to be composed and resigned. It were in vain that they should attempt to compress the surge of popular sentiment.

"Sir, it is idle to struggle against public opinion. The power exists not that can isolate the policy of the Government from the conscience of the nation."

Surely this last sentence contains a truth which all popular governments must learn sooner or later. Happy are they who are wise enough to receive it ere they are compelled to hear it in the roar of the advancing sea of popular fury,—before it is thundered upon them in the storm of revolution.

We really had some quite respectable political prophets in those old days. This particular prophet from the land of the South, whose heart, if he had a heart, was with the Northern sentiment, if not party of freedom, was tempted like Balaam, with promises of "great honor" by the Moabite Confederacy, to curse our Israel, and not having a wise and faithful angel to stand in the way and rebuke him, for his "perverse ways," duly did the cursing and paid the penalty.

The most brilliant and picturesque star of the Senatorial stage of his time died soon after the close of the war, of what is now called *paresis*, a malady too common to be very seriously considered. In those primitive times, when it was rare, we gave it a more simple and awful name. We called it "Softening of the Brain," and shuddered.

The Count and Countess Pulsky, quite the most agreeable and cultured of the Hungarian suite, represented the Governor and his wife at one of the receptions, as it was not thought advisable for Kossuth to show any sympathy with the

Free Soil party. Abolitionists of the Garrison school accused him of cowardly inconsistency for his unwillingness to fraternize publicly with them, denouncing him solemnly as a traitor to universal humanity, for the sake of a little strip of the world—his country—but few of the political antislavery party blamed him for shrinking from any step or the utterance of any sentence which might bring defeat on the last wild hope of his life of struggle, suffering and gigantic disappointment. We could only exclaim the “pity of it!” and doubt the wisdom of such guarded silence. We could hardly find fault with him while so few of our eminent Whig or Democratic friends would visit us in Coventry, openly, neither would army relatives. Dear Horace Greeley would only drop in for a few moments on the edge of the evening, and dear story-telling Tom Corwin on the other edge, staying when the coast was clear into the small hours. It was a period of petty social tyranny and subserviency—mostly unconscious, the outgrowth of an institution founded on wrong, or the misapprehension of right, and encompassed by fear. I was about to add, thank God, they are over now, oligarchy and ostracism! but are they?

No, we did not blame Kossuth for not taking a hand in our game when he did not believe his own was lost. We stood by him loyally till something occurred at Washington that convinced even us that the popular idol was not all pure gold from top to toe. It is not a pretty story, but as a faithful historian I feel bound to relate it. Alas! it must be cruelly condensed, there being in the history of the heroine enough eventful and emotional matter to furnish forth a modern historical novel and eke a play. There was a woman in the affair—there were two of them, and “nothing could avail.” Then residing in Washington was a beautiful young Polish *émigrée* of good family and name, Apollonia Jagiello, a fiery patriot, whose heart had been almost broken by the failure of the uprising of 1846, which had promised so much. She had actually served in that valiant effort as a soldier, after giving generously of her means. When the cause of Poland was lost she threw herself into the Hungarian struggle, and

being a bold and skillful rider was commissioned a lieutenant of cavalry, and distinguished herself for bravery, leading her men in several battles. When not active in the field she was nursing the sick and wounded in the hospital at Comorn, of which she finally had charge. When all was apparently over with that revolution she emigrated to America with the venerable Governor of Comorn, Ladislav Ujhazy, and his family. She was a bright, accomplished woman of about twenty-five, a brunette, very graceful and animated, tho her fine face always had a touch of melancholy. She betrayed no coquetry in manner or speech; her *mein* was proud and high-spirited, but pure womanly. She was the more intimate in the Bailey household for having become the betrothed wife of our friend, Major Tochman, a Polish attorney, legally representing the heirs of Kosciuszko in a just and long neglected claim against our Government. Major Tochman was a man of high birth, being the nephew of the great Polish leader, Prince Adam Czartoryski, then in exile in Paris. Major Tochman met Mlle. Jagiello at the house of old friends, where she had taken refuge while awaiting the next and final revolution in Poland, “which,” she said, “God is keeping for her, and believing in Him I must believe it will come.” Her host, M. Tyssowski, was another interesting Polish refugee, with a romantic career. Highly accomplished, of good family, he enjoyed, during the brief life of the Republic, so-called, much civil and military honor—was in fact dictator. In our country he declined to the position of a Government draftsman, but without the sacrifice of dignity, energy or cheerfulness. A people of wonderful adaptability, philosophy, heroic patience and recuperative resources, these many-tongued Slavs! May it not be that Providence permitted the overthrow of their proud, circumscribed old kingdom that they might be scattered over the crude and vast new world, to season it with qualities which it in great degree lacks, and which they have in such superb abundance?

Major Tochman and his *fiancée* were full of joyful enthusiasm over the advent of the Kossuths in Washington, and went early to the first public re-

ception. The Major, well known as a Polish patriot, led his companion eagerly forward to present her. As they were announced, Madame Kossuth, a tall, dark, rather severe looking woman, extremely proud and conservative, she being a dame of rather high degree, spoke in a low tone to her husband, and coolly turned away from the advancing pair. Kossuth was not quite so rude, but still did not smile or offer his hand. The Major was cruelly wounded, but mechanically turned and followed Mlle. Jagiello from the room—not pausing to speak to any of their friends, whose presence so accentuated the astonishing rebuff. Mlle. Jagiello bore herself with rare dignity, tho a flush came to her face at first, as tho her pale cheek had received a blow, but she said no word, she even smiled slightly as she drew away from that arrogant pair, and passed out through the curious crowd. They came to us, their good friends, with their sore, perplexed hearts. The true woman bore up bravely and tried to comfort her betrothed husband, but he would not be comforted. I never witnessed such suffering as his from a slight; to him it was a deadly insult; there *must* be some reparation, he said. Madame Kossuth *must* apologize to Mlle. Jagiello and receive her properly, to put an end to a cruel scandal. A common friend, a distinguished gentleman, sought an explanation of the indignity with a request that it should in some way be atoned for. He reported that Madame Kossuth had nothing to say against the honor of the lady, except that she had offended against the conventions and *convenances* of society—dewomanized herself by military service, had worn a sword if she had not used it, had donned masculine habiliments and vaulted out of her sphere into a saddle, which was not a side-saddle. All this seemed the more intolerably unreasonable from the fact that several Hungarian and Polish ladies had commanded men and fought in

the wars of '47 and '48. Haynan shot one of them, Captain Carol, niece of General Windischgratz. But nothing could move Madame Kossuth nor the Governor. Lieutenant Apollonia Jagiello could not be received at court.

Not everything had been lovely among the showy, sword-jangling, unreasonably large suite who “tagged” the great Hungarian about the country; there had been reports of offensive pretension, of outlandish foreign habits of living, of uncanny hours of eating and drinking, with noisy wranglings, accompanied by what seemed profane expletives, all the more awful for being in such an unchristian tongue, but nothing so unpleasant as this incident occurred. There was a correspondence between the principals, and letters got into print, but failed to help the matter, as they always do, only serving to spread abroad a local scandal and to cool down the Magyar enthusiasm. A paragraph from a letter which I received from Mr. Whittier will show this effect. He says:

“Thy letters, in regard to Kossuth, give a very clear idea of him. I did not like the Tochman correspondence at all. Kossuth's reply was not courteous or just. The paltry dissensions of the Hungarians among themselves—their pride, jealousy and vanity—will do more to injure them than Russian interference tenfold.”

The hard, inflexible spirit which Kossuth showed in this affair might have prepared us for the stupendous obstinacy which kept him “sulking in his tent” for half a century. His purpose in the divine plans as to his own country was fulfilled before he came to us, and on the whole it was a grand purpose, or his country would not keep his memory so green, nor patriotic young Hungarian students demonstrate on his lamented death-day, as of late they did, by valiant rebellion against their professors and glorious onslaughts on the police of Budapest.

NEW ROCHELLE, N. Y.

Mistaken Criticism of Christian Science

By W. D. McCrackan, C.S.B., M.A.

[Mr. McCrackan is a graduate of Trinity College, Hartford, Conn., of eighteen years' standing. He has also graduated from the Metaphysical College of Boston, Mass., and he is a member of the Authors' Club, of this city, and the American Historical Association and the American Social Science Association. Aside from numerous magazine articles he has published in book form "The Rise of the Swiss Republic" and "Romance and Teutonic Switzerland." As a Christian Scientist he is chiefly known to the outside world as the "Christian Science Publication Committee for the State of New York," whose duty it is to act as officially authorized spokesman for the denomination in the press of this State.—EDITOR.]

THE discoverer of Christian Science has met and mastered much ignorant fault finding directed against her personality or against her teachings. She has done this with a patient love and forbearance that have won the admiration not only of her students, but also of the unprejudiced public at large. Christian Scientists have learned from her not to retaliate in kind nor to make personal attacks. The logic of events is justifying their faith daily and hourly by its beneficent results in reforming the sinner, healing the sick and comforting the sorrowing. The respect for the rights of others which they are taught is based upon a clear perception of the Brotherhood of Man as a spiritual reality. They can wait, watch and work in peace, knowing that the good they do is immortal and that God shows them the way to atone for their mistakes and failures.

In this brief article, therefore, I have no desire to enter into any controversy with persons. The critic may be moved by a variety of motives and influences. He may be honest, but unacquainted with actual facts. He may have no deeper purpose than to give expression to the gossip he hears. I do not consider myself competent to pass judgment upon the critic himself, but experience has shown me the falsity, perversity and futility of much which passes for criticism of Christian Science, and I believe that the readers of THE INDEPENDENT will be glad of a brief analysis of the subject.

Let me state at once that I have yet to read a criticism of Christian Science which contained a correct or comprehensive statement of its teachings. It is my firm conviction that no one can really understand these teachings without be-

ing favorably impressed by them and wishing to put them to immediate application in practical every day affairs. Thus a very large number of earnest and intelligent people have already come to the conclusion that Mrs. Eddy's teachings are the very truth of Christianity, uttered to this age, in regard to the nature of God and man and the universe. A still larger proportion of the public are persuaded that her teachings are instinct with glorious possibilities for mankind. Only a relatively small number of persons take antagonistic ground, and among this small number it will be found that few have ever even studied Mrs. Eddy's works, much less attempted to put her teachings into practice.

Christian Science offers that which every man is seeking: happiness, health and a measure of holiness. It does not postpone the promise of the kingdom of heaven until after death. It opens the way, here and now, for the fulfilment of Christ's promises, in so far as the individual has sufficient spiritual understanding to rely upon these promises. Does any Christian desire more? Then why should the teaching and inculcation of a Science which shows man his real self and the real universe under omnipotent Good arouse any opposition?

There is no denying the fact that since the appearance of "Science and Health With Key to the Scriptures," by Mary Baker G. Eddy, almost forty years ago, a gradual change in popular views on the subject of theology, medicine and natural science has made itself felt.

Christian Science has roused the world from the lethargy of routine beliefs. It has been persistently emphasizing the Scriptural teaching that "God is Spirit" (John 4: 34, R. V.) and that the

real man, made in His image and likeness, must, therefore, be spiritual and not material. Christian Science has been blotting out the awful spectacle of a revengeful god and bringing into relief St. John's grand statement that "God is love" (1st John 4: 16). These teachings are not based on sentimental grounds, but on logical, scientific deductions from the Scriptures, and are freeing receptive persons from the mental, moral and physical diseases caused by the fear of an unnatural god as creator and controller of the universe. Christian Science practice in healing the sick has proved to the medical fraternity the necessity for paying greater attention to mental symptoms and for relying less upon drugs and manipulation. One of Mrs. Eddy's greatest services to mankind was to show the unscientific nature of mesmerism, or hypnotism, as it is more commonly called to-day. Years ago she showed how this educated will power affected the sick, but warned the public against its use as detrimental in the long run alike to operator and subject. In establishing the true Christian system of metaphysical healing it was necessary for her to expose the false human mode of suggestive therapeutics.

As in the realm of theology and medicine, so in that of natural science, Mrs. Eddy's teachings have pointed to a complete revolution of thought. Take, for instance, Mrs. Eddy's well known teaching concerning the nature of matter. It is significant that within very recent times noted natural scientists like Lord Kelvin and Sir William Crookes have startled the public by their changed views on this very subject. As far as I can judge from the reports of their utterances published in the newspapers, their investigations have led them to resolve atoms into forces, thus bringing their conclusions ever closer to those of the psychologists who maintain that matter is merely a mental concept.

The bearing of these conclusions upon the subject of Christian Science is readily seen when we consider that they denote an approach, tho still a timid one, to the position taken so many years ago by Mrs. Eddy. In "Science and Health" she writes:

"Matter is nothing beyond an image in mortal mind" (p. 116).

"The world would collapse without mind" (p. 209).

"The term Science, properly understood, refers only to the laws of God, and to His government of the universe, inclusive of man" (p. 128).

The theories which presuppose power in matter have been thus characterized by Mrs. Eddy:

"They either presuppose the self-evolution and self-government of matter; or else they assume that matter is the product of Spirit. To seize the first horn of this dilemma, and consider matter as a power in and of itself, is to leave the creator out of His own universe; while to grasp the other horn of the dilemma, and regard God as the creator of matter, is not only to make Him responsible for all disasters, physical and moral, but to announce Him as their source, and so make Him guilty of maintaining perpetual misrule, in the form and under the name of natural law" (p. 119).

In view of the growing perception on the part of the psychologists and physiologists that thought alone is force, and that matter is a mere concept of the human mind, the writings of Mrs. Eddy become constantly more impressive to the general public. The trend of the more progressive thinkers lies clearly in the direction of Christian Science; nevertheless, the teachings of the latter are still so far in advance of general modern thought that for this reason they are more readily apprehended by those persons who are hungering and thirsting after righteousness, and are ready to make sacrifices in their search for the solution of the problem of being. Christian Science is also having a marked influence upon the position of woman. Without propaganda or pronouncement it has placed woman upon a footing of entire equality with man in the Christian Science denomination. The grand results it has accomplished in temperance reform alone would entitle it to a foremost position among the altruistic movements of to-day.

These are some of the services to mankind which Christian Science is performing. In spite of these services, however, futile criticism has been leveled against Mrs. Eddy's education, against her literary style, even against the price of the text-book she has written. Much of this criticism has been uttered from pulpits devoted to the good news of peace on earth, good will to men.

Every means Mrs. Eddy has instituted for the protection of Christian Science from perversion has aroused criticism from quarters in which there seems to be no desire that Christian Science should succeed.

A reasonable remuneration for Christian Science practitioners has been stigmatized as a sign of greed and avarice. At the same time those who have been the recipients of Christian Science benefits declare with justice that no amount of money could adequately pay for the blessings received. Criticism has played up and down the gamut of possible objections, but has proved self-contradictory. It has sometimes objected that Christian Science tries to ignore sin, but on other occasions it has been obliged to concede that this very Science has made men and women better, which, after all, is the only real test of the destruction of sin. Criticism has found fault with Christian Scientists for considering it

their Christian duty to heal the sick as well as reform the sinner, and yet no criticism has ventured to deny that Jesus, his disciples and apostles and the early Christians took this same view. As Mrs. Eddy has well said ("Science and Health," p. 142):

"Anciently the followers of Christ, or Truth, measured Christianity by its power over sickness, sin, and death; but modern religions generally omit all but one of these powers,—the power over sin. We must seek the undivided garment, the whole Christ, as our first proof of Christianity, for Christ, Truth, alone can furnish us with absolute evidence."

Christian Scientists have promised, in their church tenets, "to be meek, merciful, just and pure" ("Science and Health," p. 497). They claim nothing for themselves which they are not glad to concede to others. It is by the elimination of sin and sickness that they are proving their right to teach and practice Christian Science.

NEW YORK CITY.

Travel Comparisons in Europe and America

By the Rev. Francis E. Clark, D.D.

PRESIDENT OF THE UNITED SOCIETY OF CHRISTIAN ENDEAVOR

A COMPARATIVE view of railway traveling in different parts of Europe will be of interest, I think, to the prospective traveler, and of no less interest, perhaps, to the stay-at-home, who prefers to travel only through books and magazines. In a general way, it may be said that the further north you go the better the accommodations, and as you journey southward the comforts of travel diminish and its hardships increase. There are exceptions to this rule, to be sure, but it will do for a generalization. In Sweden even the second-class passengers have all the comforts of travel and most of the luxuries, and you can journey due north from Stockholm for a thousand miles until you get far beyond the Arctic Circle, even in the dead of winter, and be as warm and well fed, as

luxuriously couched and as well ventilated as in your own home, and all for a very moderate price.

In Germany and Switzerland travel is very tolerably comfortable, in Austria and Hungary the accommodations are very much the same, while Russia approaches more nearly to the standard of Sweden. But comforts and convenience steadily diminish as you journey south, until you reach the climax of discomfort, filth and slowness in Southern Italy, Greece and the Sultan's dominion in Europe.

Many countries are adopting in a modified way the American system of railway cars, tho these usually take the form of compartment cars, with a corridor down one side, which is a happy modification of the old-fashioned stage coach car that still largely prevails in

Great Britain, but yet a considerable distance from the more democratic, open, aisle-down-the-middle arrangement of our American trains.

In Switzerland, however, the American plan has been more nearly adopted, for an aisle runs through the center of the car, tho each car is usually divided into two or more compartments, with doors between, for smokers and non-smokers and for different classes of travelers.

From European time tables our railway managers have something to learn. Some of them adopt the twenty-four-hour system, which *me judice* is by far the most convenient. Others, for the sake of distinguishing between night and morning hours underscore the minutes after six o'clock p. m. and before six o'clock a. m. with a heavy line. Thus a train that leaves Lucerne at 6.50 in the evening would be marked as above, while one that left at 6.50 in the morning would have no distinguishing underline. This is much less confusing than the light and heavy type by which our railway tables distinguish the night hours from the day time. The underscore catches the eye much more readily. Particularly when the type gets worn, it is often difficult to tell the heavy from the light without careful scrutiny.

In the matter of baggage, customs vary in different lands, but nowhere is the system of forwarding it so convenient and admirable as in America. The little brass check which answers for your trunk or grip is a boon which few Americans appreciate because they have never been without it. In Great Britain the system is worst of all. No receipt or voucher of any kind is usually given for your luggage, and you must either take it with you, or "label" it for the "van" and then be ready to pounce upon it at your journey's end without a moment's delay. Every one claims his own baggage and gets his own porter to carry it away, if it is too heavy for his unaided powers. How endless loss and confusion are prevented it is difficult to imagine, but the fact that our English cousins have endured the system with complacency since railroad cars began to run is proof, I suppose,

that its defects are endurable. One would think that evil-disposed persons could at any time make a good haul by being first at the door of the baggage van and making off with bags and portable parcels, for which the owner has absolutely nothing to show that they are his.

On the Continent of Europe a cumbersome system of registration of baggage is adopted. A receipt with a number upon it, the number of pieces and their weight is given to the owner, and the corresponding number is liberally pasted upon his bags and trunks. On presenting his receipt he can get his baggage. But it behooves the American traveler to go with as little impediment as possible when visiting foreign parts, for baggage is a troublesome and expensive luxury at the best.

In Switzerland, Italy and some parts of Germany no free luggage is allowed, and a good sized trunk or two costs nearly as much as an extra passenger in the party. Even where liberal customs prevail, the amount of baggage allowed is very limited, and it all must be weighed whenever a fresh start is made, and endless trouble and vexatious delays result in trying to pilot unnecessary baggage through the custom houses and across the frontiers of a dozen tiny European states.

The arrangements for leaving luggage in the parcels offices seem equally primitive to an American. It is a slow and toilsome process, compared with our own check system. The name of the traveler must be recorded on the company's books, and other particulars about his baggage, after which a receipt with a number on it is given him, and the corresponding number is pasted onto his hand baggage. I have sometimes stood in a line at a parcel window for fifteen minutes, when every minute was a precious one, waiting for the slow and fat-witted baggageman to record the names and other particulars of a long and profanely impatient line of exasperated travelers. It must be admitted, however, that the charge for this service is more reasonable than it is with us. In England it is only two cents, and on most parts of the Continent but little more than this, while

with us it is never less than five cents and more often ten. For our great corporations to mulct every traveler on their lines who wishes to leave in their stations, for an hour, a bag or overcoat or umbrella, ten cents for every separate piece of baggage, is a petty extortion that only Americans would put up with.

Some other arrangements of some foreign roads I would like to see adopted in America. For instance, the "abonnement" system of Switzerland. According to this plan a traveler can purchase a ticket good for two weeks, for a month or for a year, on almost any railway or lake steamer in Switzerland. A third class "abonnement," which is the cheapest, and which affords fairly comfortable accommodations in Switzerland, costs seven dollars for two weeks and eleven dollars for a month, while a three months' ticket is still cheaper in proportion to the time for which it is good. Second and first class abonnements come, of course, considerably higher than the third class, but are by no means dear, when it is remembered that one can travel day and night, if he chooses, through the loveliest scenery in the world, and over railways that are the most difficult and costly to construct, like the St. Gothard and the Mt. Cenis. Some of the mountain railways and the steamers on two or three lakes are not included in this arrangement, but practically on an abonnement ticket one can go anywhere from Basel to Lugano in French, German or Italian Switzerland for weeks at a time, for a nominal number of francs.

This is possible because of the state ownership of railways and steamboats, and in this respect, as in so many others, this sturdy little Alpine republic sets an example to the rest of the world. Careful calculation has proved that this abonnement system is as profitable to the railways as it is convenient to the passenger, and a large additional income is derived from these universally good tickets.

The zone system of Hungary, which greatly reduces the fares within certain well defined belts of travel, is another one that might well be adopted (I speak

at least from the traveler's standpoint) by our railway magnates.

The speed on most European railways is certainly much less than on our best American trains, and the accommodations for long journeys are much poorer. Sleeping cars ask a prohibitive price, parlor cars are unknown, while libraries, buffet cars and many of the ordinary conveniences of American travel do not exist. But, then, the distances in Europe are comparatively short, the average tourist is not racing by steam to keep a business appointment, and the humble and cheap "bummelzug," which stops not only at every pair of bars, but at every hole in a hedge fence, will give him a better idea of the country and the people and more vivid pictures of the land through which he journeys. His experiences of foreign travel, however, are not, on the whole, calculated to make him dissatisfied with what he finds on his return to America, especially with her comfortable, democratic, one-class system of rapid transit.

No small perplexity is more annoying to the traveler in Europe, especially on his first journey, than the differences in moneys, weights and measures. The countries are so small in area and their boundaries so near together that almost before the traveler knows it he is out of Holland and into Belgium, out of Belgium and into Germany, out of Germany and into Switzerland, and in each one he finds a different coinage and currency. He has scarcely gotten used to guldens and cents and learned that one Dutch gulden is worth forty American cents, and one Dutch cent two-fifths of an American cent, when he must learn that the next little nation, about as large in territory as Maryland and in population as Massachusetts, uses francs and centimes, and that a franc is worth twenty cents and a centime a fifth of a cent.

This money, based on the decimal system like our own, is easy to learn, and the traveler soon gets used to it, only to find some bright day that he has crossed another frontier from Belgium to Germany, and must reckon his change in marks and pfennigs, and that a mark is equivalent to twenty-five

cents and a pfennig is one one-hundredth as much. This he becomes proficient in just in time to change back to francs and centimes as he crosses into Switzerland or France. On the way he will very likely get into Austria for a few days, and then his troubles will begin afresh, for he will have two kinds of currency to reckon in, florins and kreutzers, crowns and hellers, of which the former are worth just twice as much as the latter. The Government is trying to assimilate the coinage to the decimal system of France and Italy, and, in the meantime, the people stick to the old coinage and reckon everything in it, tho there are no current coins to pay the reckoning in. You will be told, for instance, that your room at the hotel will cost two florins and a half, which seems very reasonable, until you find that there are no florins, and that you must pay five of the current "crowns" for it. Everything in the shop windows is marked in florins and paid for in crowns.

Another element of confusion arises from the fact that tho the attempt has been made to assimilate the coinage to that of the Latin countries, it has not altogether succeeded, for each kronin is worth a little more than a franc and each heller a trifle more than a centime, in the proportion of about 49 to 51; so that forty-nine kronins are worth fifty-one and 25-100ths francs.

Cross the border from Austria into Russia and you find a totally different currency, and roubles and kopeks take the place of kronin and hellers, and your American dollar, which was worth about five kronins, is only worth two roubles.

Spain's pesetas are nominally of the same value as France's francs, but the rotten state of her finances has so depreciated the value of her coins that a French franc is worth considerably more than the Spanish piece of the same size and weight, and thus a new complication in reckoning the value of money is introduced.

In Portugal the depreciation has gone still further, and, moreover, the "reis," in which values are reckoned, is of such an absurdly small value that everything at first blush seems enor-

mously expensive, until it is reduced into the smaller figures of some more familiar currency. When buying my ticket from Lisbon to Paris I was astounded to be told that it would cost forty-two thousand, seven hundred and fifty reis, but when I found that the whole sum was less than forty dollars my fears of immediate bankruptcy were not so acute.

In Scandinavia we get back to crowns, as in Austria, but a Swedish crown is worth considerably more than an Austrian, in the proportions of 36 to 49.

Fortunately Norway, Sweden and Denmark have an assimilated coinage, and the money of each of the three countries is good in all, Sweden and Norway, of course, having the same, and Denmark coins passing in the great peninsula to the worth of their face value.

In Bulgaria, Servia and Roumania and Greece the coins approximate in value to the francs and centimes of the Latin countries, tho somewhat depreciated in value, while in Macedonia the Turkish coinage is used, which can readily be understood after an apprenticeship in the other Balkan States.

But of all currencies, the British is the most archaic, complicated and confusing. Even the English themselves good-naturedly admit this, while not making any serious efforts to change it. Other currencies, while confusing enough to a foreigner, are at least based on the decimal system, and one hundred of the smallest current coins can be counted upon to make one of the ordinary units of currency, like the franc, mark or crown, but the British is duodecimal, if anything, while the utmost pains seem to have been taken to disregard even the duodecimal plan on which the currency is based, and hopelessly to mix up the bewildered traveler. Tho twelve pence make a shilling, yet twelve shillings do not make a pound, as you would suppose, but twenty; neither do twelve farthings make a penny, but only four.

Moreover, a common coin in which many values are reckoned is the half-crown, which is neither two shillings nor any even multiple of a shilling, but two

shillings and a half, while the half-crown piece is so nearly the size of the two-shilling piece, which is equally common, that the foreigner is often greatly in doubt which is which. The two-shilling piece, too, is often called a florin, which is another source of confusion to the unfamiliar traveler.

Americans, however, cannot throw any stones at the Mother Country so long as we maintain the absurd and archaic system of weights and measures, in the face of the demonstrated advantages of the decimal system adopted by all the rest of the world, except that portion that speaks the English language.

The confusion of the American traveler is enhanced, of course, by the comparative smallness of many of the European states. It is as tho New York used marks and pfennigs; Pennsylvania, francs and centimes; Ohio, kronins and ores; Kentucky, crowns and kreutzers; Illinois, roubles and kopeks; Iowa, pesetas and centivos; Nebraska, reis, and New England, pounds, shillings and pence.

There seems to be no sufficient reason why the currencies of the civilized

countries should not be assimilated on the same basis. This has been done already practically in the Latin countries of France, Spain, Italy and Switzerland, and tho the depreciation of currency in some countries makes similar coins of slightly different values, yet it is a great gain to have the coins nominally and approximately of the same value.

Sweden, Norway and Denmark, as I have said, show what can be done by contiguous countries to make the coinage of precisely the same value, as also have the United States and Canada in the new world. Why should not this reform be extended, every country, for instance, adopting the value of the franc (20 cents) as the unit, since that is now more widely used than any other; calling these coins by different names, if they choose, or, better still, having common names for all, adopted, perhaps, from the Volapük or Esperanto languages? Here is a reform quite as worthy of the genius of our great financiers as the Morganizing of the Atlantic or the Americanization of the London tramways.

BOSTON, MASS

The West's Harvest Money

By Charles M. Harger

‘‘HOW much money will you need for harvest?’’

This is the query that is sent from Eastern banking houses to hundreds of bankers of the wheat belt. It is the key to an annual tide of currency. This year it was emphatic because it was understood that the West would have a great wheat crop.

The banker bases his reply on the condition of the crop. This year he asked for liberal sums. He knew that his customers would be plenty. It aroused the Eastern bankers, and they flooded the West with more careful and searching questionings. The financial editors of the city papers assisted them, and this

before the machinery of furnishing the actual currency began its movement.

The most importunate claimant for this currency is the roving harvest hand. The Kansas State Employment Bureau estimated that 20,000 extra men would be needed for cutting the wheat. Some of these begin their work with the opening of the harvest in Oklahoma in the first days of June, marching with the wave of yellowing grain until it reaches in its solemn movement, at the rate of twenty miles a day, the hard spring wheat region of North Dakota. Others go into a single community, work two weeks or less, and go back. In a given community they stay two to three weeks

and receive from \$1.50 to \$2.00 a day, according to the strength of the demand for help. These 20,000 men, together with the home contingent which goes out from the towns, fully as many more, must then be paid not far from \$3,500,000 in the course of the twelve weeks harvest over the wheat belt. This money passes from hand to hand in currency of small denominations—silver dollars and \$1 and \$2 bills, largely.

A young business man of an Eastern city bought a Nebraska wheat farm and went out to superintend the harvest. He took with him his check book and his office ideas. He listed up the men and on the first Saturday night called before him the laborers. Fifteen of them had arrived on excursion, second-class tickets, from the manufacturing towns of Illinois. As they passed him, he handed each a bit of blue paper calling for nine dollars.

"What's this fer, boss?" asked the boldest of the motley company.

"A check for your wages, of course."

"Where's th' cashier's desk?"

"You must take it to the bank in town and get your money," he explained. Then the men marched up and handed back the checks.

"Th' bank man won't know us," sniffed the spokesman, looking down at his rough clothing and sun-browned hands. The farm owner saw the force of the argument, and drove to town for silver and bills with which to pay his help.

This was characteristic of the situation on other farms. Thus it is that the West needs harvest money for its laborers. The amount varies, however, with the development of the community. In earlier days practically all the wheat belt was in such condition. Now the extreme demand is confined to those sections with least settlement. In the older communities the help is furnished to a greater degree from the surrounding towns, and the men take checks or let their credits stand for a few days or even weeks, to the end of the harvest season. To be sure, the orders must be paid in currency from the bank, but before the checks are cashed they may have served as currency among the local merchants through several transactions. It

is out on the prairie section, where wheat is grown by the tens of thousands of acres without a large population residing among the fields, that there is the greatest need of harvesters and of special arrangements for the harvest.

Last year the banks of New York City lost in cash to the West during the harvest season \$21,000,000. It was estimated that they shipped to the harvest section during the entire season fully \$50,000,000. The wheat and corn section must be well equipped if it expects to handle its harvests without Eastern help. This it might do if it were able to convert all its resources into currency, or even a large part of them. But in such case the East would be called upon to help furnish this actual cash.

It is customary for the West to tell of its great prosperity—and it has accomplished wonders. It loans money saved out of its good years on the call market of New York, and it even invests in the bonds of Eastern States. Bonds of Massachusetts to the amount of \$300,000 are carried as a part of the school fund of Nebraska. But it does not always realize the enormous demand which a large harvest makes on its resources until it reaches the acute stage of the money need; then the East, likewise unprepared because of the luxuriant reports of plenitude, is suddenly asked for its good service.

Not all the money is needed in the beginning of the harvest—indeed, then is the lightest demand. The banks have been storing up currency for the occasion, and they are prepared to meet the needs until the grain marketing begins and there is a double pull on their reserve. But the marketing takes more of credit and less of the currency, for whole train loads of wheat are bought, loaded, shipped, sold and settled for without the handling of a dollar in actual cash. Credits are exchanged—no more.

A banker of St. Paul, Minn., writing of the course his bank is taking, says that between April 1st and July 1st of this year about 25 per cent. of the bank's entire loan fund was put into Eastern commercial paper—that is, the notes of New York jobbers and wholesalers; also some collateral paper, payable in September and October next. His idea was

to have his reserve earn money during the summer, and then in the autumn, when it would be needed, to have it accessible on call. This was all right for the Western bank, but should it be the general custom of the entire grain belt of the West it would mean a tremendous drain on the Eastern banks, particularly if, as has happened in the past half decade, they should rest in the fancied security of the West's ability to take care of its own harvest needs without withdrawing its Eastern deposits.

The currency that flows into the harvest section does not all remain there. Its course is a curious one. That large portion paid to the men who work in the fields divides according to the character of the laborers. One class comes in the cattle cars of a captured freight train, or of one whose crew has been coerced into obedience to the eager travelers. These men spend half their earnings—or more—before they leave the community. They buy new clothes of the local merchants, and eatables and drinkables of the refreshment stands; spend something on local amusements, and, if cautious, send part of the money home. On Saturday nights during harvest the post offices of the country towns in the wheat belt are crowded with buyers of money orders. If the laborer is so reckless as to try to carry his wages home, he is likely to leave all of it somewhere on the way.

Another class, better equipped in worldly effects, goes to the prairies in a chair car, saves practically all it gets, and takes the receipts of the trip home safely pinned inside of stout clothing.

One day a pale, slender seeker for work accosted a Western Kansas farmer. He was taken to the fields and he patiently followed the self-binder. The other laborers laughed at him and called him "sissy." He seemed ready to faint for a time, but in a few days gained strength and color. At the end of a fortnight he went to the farmer with, "I want my money."

"But you are needed here for two weeks yet."

"I know it, but I am going to quit." He took the cash, went to town and to the best hotel. A trunk had arrived for him. That evening he went to the de-

pot, dressed in well tailored summer clothes, wearing a \$25 Panama and carrying a silk umbrella. He took the train for Colorado Springs, where he had engaged rooms at the Antlers. He was a Chicago physician in search of good health. But that kind of laborers is scarce.

The volume of money needed in the actual operations of the harvest field—meaning the wages, and the expenses of cutting and threshing the grain—is but a trifle compared with that needed when marketing commences. Many banks go through the first period without outside assistance, and few have to borrow. When the grain is sold it is different. The amount paid out for the crops is so large, running up into hundreds of millions for the grain belt, that a certain per cent. is certain to be handled in currency. Said the President of an interior national bank in Kansas: "We handle during the wheat selling season \$50,000 a day, one-fifth of it going over the counter in cash. Much of this does not come back until late in the fall, when the taxes are paid and winter stores are bought; then we have the currency piled up daily and ship it East. My opinion is that many farmers, particularly those of foreign birth, hoard their wheat money until it is needed. This demand is far greater than that of the wage payment period, and is the real source of the West's demand on the East."

Were crops always uniform this could be provided for, but a record breaking yield may be followed by failure, and a bright outlook in May sometimes turns to disappointment in July. The Western wheat crop is "safe" when it is in the granary, and the corn when it is in the crib.

Of the great volume of money used "to move the crops" nearly all finds its way back again through the various channels of trade. There are large sums to be paid for farm machinery, mostly made east of the Mississippi; other sums to be paid for household improvements, and a remaining portion that goes into luxuries. Then there has been for many years—and to a less degree it yet exists—the item of interest payment on the farm mortgages and bonds owned in the East. So that as the banks resume in

the autumn their normal condition and furnish the means for the transaction of their patrons' business they transfer eastward both currency and credit until the old situation is restored.

The capacity of the Western banks to care for their customers is greater today than ever in their history. The report of the comptroller, covering, of course, only national banks, between the dates of the two spring statements, February 6th and April 9th, showed that the bank loans east of Ohio and north of Virginia, comprising all the greater Eastern markets, decreased \$18,885,636. West of the Ohio line the bank loan increase was \$59,682,125. Comparison with twelve months previous is equally interesting. Compared with April, 1902, the loan increase in the Eastern section above defined was \$44,757,593; but to the west of this the increase was \$151,701,068, excluding the Southern States, which added \$34,001,202 to the total.

The increase in the Western section in the past year was 13 per cent.; in the past two years 44 per cent.

It is a saying in the West that "you can't hurt a country while the crops grow." Crops have been growing for seven fat years in the prairie west, and with the better understanding of conditions and possibilities the people believe that they can never experience disastrous failure. Out of each of the good years something has been saved and added to the West's investment and operating fund. This reserve is not yet large enough to assure the Western ideal of financial independence; nor, with the growing recognition of mutual interests, is it likely ever to attain that place. But the problem of the "crop money" is much easier of solution than a half decade ago, and the time is in prospect when it will be merely a well ordered, every day operation instead of, as now, one fraught with some degree of anxiety.

Fiddler's Green

By Theodore Roberts

"At a place called Fiddler's Green, there do all honest mariners take their pleasure after death. And there are Admirals with their dear Ladies, and fearless Adventurers with the Sweet-hearts of their youth, and tarry-handed Sailormen laughing in cottage gardens."

NEVER again shall we beat out to sea
In driven mist, and sleet like bitter tears,
To watch the harbor-beacons fade, a lee,
And people all the sea-room with our fears.

All toil is done! No more, no more do we
Square the slow yards, and stagger on the sea.

No more the weariness of day and day
Unchanged, unshadowed, where the weed
drifts by,
And leaden fish pass rolling at their play,
And changeless suns crawl up an empty sky.

Our watch is done! No more, no more do we
Pray for the wind to break the polished sea.

Cities we saw—white wall and glinting dome,
And palm-fringed islands dreaming on the
blue.
To us, more fair the rugged cliffs of home,
The climbing roofs, the laughter ringing true.

The voyage is done! No more, no more do we
Scan the strange lamps along the stranger quay.

Night comes!—to each the night that he loves
best,

In some dear garden where the roses sleep,
And no quick clouds bank up along the West.
There is no sail to furl—no watch to keep.

Now all is done! No more, no more do we
Shout our rude chanties, toiling on the sea.

Here are the hearts we love; the lips we know;
The hands of seafarers who went before.
The eyes that wept for me a night ago
Are laughing now, that we shall part no more.

All pain is done! No more, no more do we
Make sail at dawning for the luring sea.

Wonders we saw, and beauty in far ports;
Laughter and peril on the swinging deep;
The wrath of God; the pomp of pagan courts.
*The rocks sprang black!—and, lo, we woke
from sleep.*

All fear is past! And nevermore shall we
Square the slow yards, and stagger on the sea.

FREDERICTON, N. B., CANADA.

LITERATURE

Newest England

THE author of the work under consideration* was formerly the first Minister of Labor appointed in New Zealand (Department established in 1891), then one of the most brilliant members of the Progressive party and afterward author of the celebrated "Compulsory Arbitration Law" (enacted in 1894); lately Commissioner from his country to the Commercial Congress in Philadelphia, and now for several years its Agent-General at London. The book is "written to give information, and not to make converts;" as he says in the preface, his "primary object has been not to write a bright and diversified book, but to serve unprejudiced students by collecting and classifying facts." He does not attempt a complete survey of democracy and its working in Australia and New Zealand, but rather a "connected account of the more interesting experiments in law and administration during the twenty-one years between 1881 and May, 1902," and particularly since "1890, the date of a new departure in colonial politics," when the Progressives attained their present tenure of uninterrupted power. For six years his attention has been given directly to this endeavor, and for twenty years and over his life's business and his leisure have related to the questions treated here. Yet presence in England, thousands of miles from the colonies, has made the execution difficult, as also the subject matter of the book, which deals with "a throng of reforms and changes in *seven separate communities*—experiments not settled and done with, but nearly all in progress, still matters of controversy—succeeding, failing, expanding or being patched up month by month." He professes to be not dispassionate indeed, but fair, and to present candidly all sides of every question that have importance and

relevancy to the occasion. And finally he furnishes the interesting information that not from England, but from France and the United States has come the most intelligent interest in recent enactments in the seven colonies; and from these countries three studies of real merit have appeared, by Henry Demarest Lloyd, M. Métin and M. Siegfried, which respectively he characterizes as follows: "From three different standpoints—the cordially sympathetic, the cold-bloodedly impartial and the steadily critical—these three gentlemen have done their work well, so far as New Zealand is concerned."

The work is full of interest and power, and fully justifies the expectations aroused by the introduction. Like Dr. Johnson, the author can reason close or wide, and when opportunity offers presents us also on occasion with passages of graphic picturesqueness about the country and the climate, as well as on the men and measures of the day. Yet the subject is not intrinsically interesting, and only one who comes with a cultivated taste for economics, law or politics will find reflection here. But every serious student of society must know the book, and will appreciate its excellence not only for purposes of reference, but of refreshment in the discouraging struggle for reform.

The opening chapters especially, "A Continent and Some Islands" and "The Progressive Movement," are thoroughly worthy of the general reader's attention. One recurrent peculiarity of these pages must be emphatically noticed—namely, the frequent references to attacks by the London papers, particularly *The Times*, containing not only predictions, but the reported accomplishment of failure in the workings of these institutions—attacks which are rebutted without apparent prejudice or passion, and invariably with satisfactory explanations and sufficient admissions, making them seem like the bigotry of blind tradition or the

* STATE EXPERIMENTS IN AUSTRALIA AND NEW ZEALAND. By William Pember Reeves. Two volumes. New York: E. P. Dutton & Co. \$7.50 net.

indifference and the hostility of sheer prescriptive privilege and position, that un-Athenian English inability to learn or do immediately any new thing. To come to constructive criticism of the book: The main peculiarities of colonial social experiments are, "first, the almost unlimited trust placed in the people; second, the free use they make of their power; third, the drift, or semi-conscious progress, into Governmentalism." Their "sort of a Socialism" differs from the French, inasmuch as it has not led to co-operation or communism; from the German, inasmuch as it avowedly takes short views and works piecemeal; from the English, in exploiting Centralism rather than Municipalism. If it be Socialism, it is *democratic and not bureaucratic*. It is, in M. Métin's clever expression, *a Socialism without doctrines*. Or, to quote Mr. Reeves:

"They look upon their colonies as co-operative societies of which they, men and women, are shareholders, while the governments are elective boards of directors. They believe that by co-operative *action through the state* they can compete with trusts and other great organizations of capital abroad, and dispense with great companies and corporations within their own borders."

In short, government is the organ of the whole people for the expression and execution of their common ends, not utilized in the interests or for the privileges of a part thereof. And these innovations were all departures taken by the Middle Classes before Socialism or Labor parties were heard of in the land. The absence of the privileged, and in great part of the miserable, says Mr. Reeves, has visible effects. The individual counts for more. "Those who believe that energy and initiative are just the qualities which Governmentalism blights must find Australia and New Zealand a paradox. Amongst their people 'the state is more and more,' but the individual does *not* wither."

A History of Slavery

THE late William Henry Smith made his home in Cincinnati and was editorially connected with two of its lead-

ing newspapers, and was in the closest relations with President Hayes and other leading public men. The present work* was prepared as a portion of the labor for writing a life of President Hayes. It hardly differs in plan from Henry Wilson's "Rise and Fall of the Slave Power," but is less encyclopedic and perhaps more philosophical. It is with the political side that the author is concerned. He has no occasion to do more than mention the work of the radical Abolitionists, whose influence for good has been vastly overrated. The author sees clearly that it was the moral impulse of patriotic men who organized politically the anti-slavery sentiment of the country that controlled the situation at last. For the Garrisonians he has no respect, with their opposition to both Church and State; but on the other hand his sympathy seems to be not with those original Abolitionists who followed political methods, and who remained with the old parties until opposition to slavery had gained control of the North.

The name of Mr. Birney, the first candidate of the Liberal party, is mentioned only once, and then not as a candidate but as chairman of a certain public meeting. In a similar way the nomination of John P. Hale is alluded to only incidentally, as if the author had no particular interest in the rise and development of the great political movement until it had culminated in the nomination of Fremont. For the Free-soilers who united in the nomination of Martin Van Buren he seems to have little more respect than for the honesty of Van Buren himself. It is with Chase and the Ohio hosts who came into the Republican ranks in 1856 that he discovers the magnitude and grandeur of the revolution which had overturned the Whig party and joined with it a fraction of the Democratic party. We do not find any suitable statement of the part taken by the Know-nothing party in the disruption of the Whig party. It may be said that

* A POLITICAL HISTORY OF SLAVERY. *Being an Account of the Slavery Controversy from the Earliest Agitations in the Eighteenth Century to the Close of the Reconstruction Period in America.* By William Henry Smith, with an Introduction by Whitelaw Reid. Two volumes. New York: G. P. Putnam's Sons. \$4.50 net.

Mr. Smith is careful not to put too much weight on the influence of New England, but discovers an initiating force in the Middle West which he thinks has not been generally recognized.

When we come to the period in which the author was in active political life, we find a clear and statesmanlike view of the movements which led to the reconstruction of the former slave States. It is not at present the fashion to remember the efforts which were made in the South to re-establish slavery under another name. Mr. Smith sees this clearly, and shows that Congress could do nothing else than what it did in giving the suffrage to the negroes. The quotations which he gives from leading men show how clear was their purpose to recognize not the rights of the white man but of *man*, white or black.

The concluding chapter of the work, written after Mr. Smith's death by Prof. John J. Halsey, of Lake Forest University, is in a different spirit, and is in sympathy with the Southern view of reconstruction and the reasons of its failure. While he recognizes the criminal methods by which the ballot has been taken from the negroes, yet he regards the failure of reconstruction under Grant and Hayes to be the recovery of the rights of local government by the people—that is, the white people. He does not hesitate to speak contemptuously of the Carpetbaggers who ruled in those days, and sometimes he surprises us by his statements, as when he speaks of "The Carpetbagger, Governor Bullock," who was certainly no Carpetbagger. He fails to see why it was that Georgia and North Carolina suffered no such evils under reconstruction as did South Carolina and Louisiana. We can hardly believe that if Mr. Smith had lived he would have written such a chapter.

The volumes are full of important historical information, much of which is being forgotten and needs to be recalled; and there is a large reference to unpublished correspondence to which the author has had access. We can heartily commend the work to the use

of students of American political history.

The "Shroud of Christ"

A LARGE piece of linen cloth exhibiting various stains, fire and water marks and reputed to be the shroud in which Christ was enveloped immediately after the crucifixion, has belonged to the Royal House of Savoy since the middle of the fifteenth century and has possessed an historical existence since 1353. It has been publicly displayed at long intervals and on the latest occasion (1898) was photographed. The photographic prints and negatives have been studied by Dr. Paul Vignon, who, in the work* before us, presents his deductions in support of the genuine character of the relic.

It is hardly necessary to remark that if any material object is to be submitted to scientific investigation, its sentimental or religious associations are not factors to be considered. The burns and water marks on the fabric are known to have been caused by a fire which occurred in Chambery Chapel, its place of deposit, in 1532. There remain other stains in two groups, each having the contour of the human form. The figures are disposed head to head lengthwise the sheet. One of them shows the front and the other the rear side of the body. The face, folded hands and general outlines are fairly clear. The countenance has the arrangement of flowing hair and beard found in the typical pictures of Christ. A photographic negative made from the cloth, which, of course, reverses the lights and darks of the original, brings out the resemblances rather more plainly.

This is all that is affirmatively disclosed. The sheet was photographed at ten yards distance by the aid of two electric arc lamps while extended above a cathedral altar. The present author reports on hearsay that the stains are reddish brown in color and the linen thin and worn. The photographs show it to be patched where burned.

As already stated, nothing is ascertainable concerning the object (if it, in fact, then existed) during the period of near-

* THE SHROUD OF CHRIST. By Paul Vignon. D.Sc. With illustrations. New York: E. P. Dutton & Co. \$4.00 net.

ly fourteen centuries following its reputed use. It is supposed to have been discovered in the Holy Land by Crusaders, who are known to have brought back great quantities of similar alleged relics for the veneration of the faithful, whose powers of inquiry at that period of the world's history were, to say the least, limited. Beyond all, this particular relic was affirmatively determined by a tribunal convoked in 1389 by the Bishop of Troyes to be the work of a confessed forger: "Finaliter reperit fraudem et quomodo pannus ille artificialiter depictus fuerat, et probatum fuit eciam per artificem qui illum depinxerat, ipsum humano ope factum non miraculose confectum vel concessum." This resulted in a mandate from Pope Clement VII decreeing "perpetual silence" concerning it.

Certainly such an array of adverse considerations as this imposes upon any one now venturing to affirm the authenticity of the sheet a burden of proof sufficient to demonstrate beyond any reasonable doubt the falsity of the confession and the error of the ecclesiastical court of inquiry. No new historical discovery is alleged. Hence no evidence presumably exists other than such as is afforded by the cloth itself.

It takes a quarto volume of nearly 200 pages to bring Dr. Vignon finally to some loosely made experiments which purport to show that a fabric treated with aloes will become discolored by ammoniacal vapors. He also caused a plaster hand saturated with ammoniacal water to produce in this way a hazy print of itself upon a cloth in its proximity. *Ergo*, he argues, if the sheet had been saturated with aloes and if a body had reposed in it, and if that body by reason of surface secretions immediately after death yielded ammoniacal vapors, then (there are pages in support of the "then" which is not at all obvious) that body might have caused stains such as appear.

This does not contradict the confession of the ancient forger nor impugn the finding of the ancient court. It is not proof that the marks on the sheet were made by like agency, not proof that a human body by its secretions could have made them, not proof that any human body was ever inclosed in it, and certainly does not furnish the slightest support

for even a suspicion that this was the holy shroud.

Justice requires a word further. When any one purporting to be a scientist undertakes to inform the public concerning the physical characteristics of an object which he has not himself investigated, and essays to substitute mere speculation for rigid physical and chemical tests applied to the thing itself, he advertises himself as a charlatan. And effrontery of this sort is not palliated either by his apparent ready faith in the sanctity of the fabric or his even more obvious ignorance of the first principles of scientific demonstration.

A Prairie Winter

DURING the past year we have been overcome with a sort of conservatory literature. Pretty Judiths have made literary capital out of their florist catalogs; they have engaged in a pot-plant agriculture and made such a romantic use of cuttings and bulbs as no real gardener would tolerate. They have introduced the betsy bug plague into polite literature, and made green vermin on their gardens a sort of horticultural tragedy. But the star performer in these flower bed theatricals is invariably the little dusty, daffy-down-dilly coquet who digs and prunes and plants while she makes eyes at the infatuated reader. Her sole purpose is to captivate his sentimental attention. We all know that the garden is only a decorated stage dug up, mulched and planted to make a floral background for her own pansy freckles and industrious antics.

But in *A Prairie Winter** we have a modest diary kept by an "Illinoise Girl," who is evidently one of Nature's little handmaidens. She is by no means the central figure in the landscape, but she is a sweet interpreter of the year's harshest season. And no book that has appeared recently has so much clear weather coloring in it. There are short chapters hinting of blue winter mornings as suggestive of the crystal cold as a frosted window pane. She climbs upon the horse block, sweeps in the rainbow bril-

* *A PRAIRIE WINTER. By an Illinoise Girl.* New York: The Outlook Co. \$1.00.

liance of her sky line with the unstudied ease of a real artist, and then hurries away to some domestic task without descending to the personality of her own feelings.

Truly, it is a delightful record of winter days, including blizzards and the first blue bird flights into spring, all written out by a cheerful little genius who can make poetry of the very suds in her washtub.

Muslim Ideas and Ideals

THIS ninth and latest* of the thirteen hand books announced for "The Semitic Series" enhances the scholarly and selling value of the others, excellent as they are. It is a manual of rare clearness and comprehensiveness, giving in pithy, compact exposition a wealth of difficult detail and making a remote and technical subject thrillingly interesting to one who reads with sympathy for human effort and the preparation of previous experience with philosophy and Christian history. Throughout the enormous range of this small volume, covering twelve centuries of Muslim history (A. D. 632-1859), proportions are observed and values emphasized, and intricate thought presented with a clear, firm touch, and a style at once rapid, positive and fresh that commands the reader's gratitude and admiration and affords him an untiring delight. Yet, of course, not everything is told, or even treated of. To mention familiar matters: "Babism is not touched at all and the Shi'ite theology and law hardly at all. . . . Turkish and Persian mysticism are equally neglected. . . . the Darwish Fraternities are most inadequately dealt with, and Muslim missionary enterprise might well be treated at length."

The author is at pains to impress upon us in the beginning the unity of Islam underneath all appearance of diversity, as well as its indomitable vitality for which a future may yet be in reserve. "In Muslim countries Church and State are one," and "in the earlier days at least

canon and civil law were one. Thus we can never say in Islam, 'he is a great lawyer; he, a great theologian; he, a great statesman.' One man may be all three, almost he must be all three if he is to be any one." The threefold division of the book is therefore for convenience. The development of the State, as the most concrete and simple side, is taken first, then follows the legal ideas and schools, and third comes the long and thrice complicated thread of theological thought. The narrative presents us with curious anticipations and reminiscences of Christian history, doctrinal and institutional, and many quaint parallels to philosophy and theology and the procedures of popular religion. There are illuminating references also to recondite points of what to us appears as secular history, the sect of the Assassins, for instance; and a continual power of learned comparison that indicates convincingly acquaintance with the broader aspects of the author's chosen field. The analogies to Christian methods of Biblical interpretation, the genesis of supernaturalism, disputes on doctrine, and the rise and fall of sects, are extremely interesting. We meet such sentences as these: "His book is marked by great piety in expression and by ability of the highest kind *in reconciling the irreconcilable*." And such descriptions: "He found in session what may perhaps best be described as a Parliament of Religions. It seems to have been a free debate between Muslims of all sects, orthodox and heretical, Parsees and atheists, Jews and Christians — *unbelievers of every kind*. Each party had a spokesman, and at the beginning of the proceedings the rule was rehearsed that no one might appeal to the sacred books of his creed, but might only adduce arguments founded upon reason." (Al-Qadir's Khalifate, Baghdad, c. A. H. 390.)

But lest one think this is an inquest we are holding on a dead subject, let us scrutinize more closely the features of Islam, and see its possibilities for good or evil.

"For them, the world is divided into two parts, the one is Dar al-Islam, abode of Islam; and the other is Dar al-harb, abode of war. In the end, Dar al-harb must disappear into Dar

* DEVELOPMENT OF MUSLIM THEOLOGY, JURISPRUDENCE AND CONSTITUTIONAL THEORY. By Professor Duncan B. Macdonald. New York: Chas. Scribner's Sons. \$1.25 net.

al-Islam and the whole world be Muslim. . . . It is still a moot point among canon lawyers, however, whether Jihad, or holy war, may be made, unprovoked, upon any Dar al-harb. One thing is certain, there must be a reasonable prospect of success to justify any such movement; the lives of Muslims must not be thrown away. (How applicable the poet: "One touch of nature makes the whole world kin!") Further, the necessity of the case—in India, especially—has brought up the doctrine that any country in which the peculiar usages of Islam are protected and its injunctions—even some of them—followed, must be regarded as Dar al-Islam, and that Jihad within its borders is forbidden. We may doubt, however, if this doctrine would hold back the Indian Muslims to any extent if a good opportunity for a Jihad really presented itself. The Shi'ites, it may be remarked, cannot enter upon a Jihad at all until the Hidden Imam returns and leads their armies." (pp. 55-6.)

But this "Hidden Imam" is another and a very interesting story. In Islam "religion and rule go together, and he who meddles with the one must next grasp at the other." Thus the Brotherhood of as-Sanusi, founded in 1837, is an order of darwishes, but is of a severely reforming and puritanic character. The present Head claims to be the Mahdi, and Professor Macdonald looks to see a new chapter in the history of Islam opened under his guidance.

"It is for the student to remember that Islam is a present reality and the Muslim faith a living organism, a knowledge of whose laws may be life or death for us who are in another camp. For there can be little doubt that the three antagonistic and militant civilizations of the world are those of Christendom, Islam and China. When these are unified, or come to a mutual understanding, then, and only then, will the cause of civilization be secure." (p. 6.)

A splendid incentive to study, it may be, but in his preoccupation with medieval history our author appears to forget the methods of modern warfare, the Sirdar and Omdurman, with its "10,800 dead Dervishes counted on the field of battle, and 27,000 found wounded against 48 killed and 382 wounded on the English and Egyptian side." (Dicey: "Khedivate," 490.) But with this vivid picture, one of many that are better founded, we must take leave of an always interesting book, even tho it often treats of what might seem to be totally uninteresting things.

The Law of Copyright

THE present work* is an attempt to make plain a subject that is covered in a legal sense by what is perhaps the most complicated and obscure series of statutes in the statute book. As Mr. Macgillivray sets forth in his preface, there are probably more pitfalls for the unwary in dealing with copyright than with any other branch of the law. Even with the present book it is questionable if the layman will be in a position absolutely to avoid these perils.

In his introduction the author has briefly sketched the history of copyright, paying tribute in so doing to Mr. Copinger, Mr. Scrutton and Mr. Drome. In the course of this introduction brief reference is also made to the changing conditions of public sentiment toward an author and the product of his pen. Part I of the treatise is concerned with copyright in its application to subjects of Great Britain, and a considerable number of English, Scotch, Irish and Colonial cases bearing upon copyright in its various phases are cited by the author. These citations are scattered throughout the book and in many cases form precedents for similar cases arising at the present time. Incidentally a book is defined, its essential elements are given and a number of examples are tabulated as to what are books. The author has pointed out the law which follows a book upon publication, and the bearing that an author's nationality has upon the protection to which he is entitled under copyright. The question of the assignment of copyright is given a place, and there is a chapter in which the remedies applicable to infringement of copyright are considered. A piratical copy is defined, and much interesting data, relating to copyright, is included that is not available in any other publication.

It is, however, with Part II, dealing with copyright in the United States, that the greatest interest will be found, in so far as American readers are concerned. There are four essentials that must be present in order to secure copyright in the United States. These are as follows:

* A TREATISE UPON THE LAW OF COPYRIGHT IN THE UNITED KINGDOM AND THE DOMINIONS OF THE CROWN AND IN THE UNITED STATES OF AMERICA. By E. J. Macgillivray. New York: E. P. Dutton & Co. \$8.00 net.

First, It must be an original literary or artistic work. Second, The owner or author must be a citizen of the United States or a resident therein, or of a foreign country proclaimed to that intent by the President. Third, It must have complied with the formalities prescribed by the statutes of the United States, and fourth, it must be innocent.

As a rule there can be no copyright in a title. Even the deposit of the title-page with the Librarian of Congress does not give the author any exclusive right to the use of that title. A title can only be protected as a trade-mark in connection with a particular literary or artistic production which has become known to the public. Photographs, according to the author's statement, were first protected by the statute of March 3d, 1865. Playing cards, printed in colors, have been held entitled to protection as "Prints."

The original life of a copyright is for a term of 28 years from the time of recording the title thereof. The author, or his widow, or children, in case of his death, have the exclusive right, continued for a further term of 14 years upon complying with certain conditions named in the law.

Poland, a Study of the Land, People and Literature. By George Brandes. New York: The Macmillan Co., \$3.00 net.

This volume embodies the author's impressions of the present situation of Poland, the result of several visits made to the country between 1885 and 1899. Dr. Brandes possesses one of the essential qualities of the ideal traveler, he loves the people he describes, altho by no means blind to their faults. He loves Poland, he tells us, not as he loves France and England, but as he loves liberty; loves it because it is a symbol of all that the best of the human race have loved and fought for. He has a tenderness even for what he regards as its superstitions; superstitions, too, that must have been particularly repellent to a relentless positivist. He does not wish to see free thought spread in Poland, for it would have a ruinous effect on the individuality of the nation, as a rupture with the religious tradition would at present be a victory for the Russian

principle. Besides, it does not matter, as all intelligent Poles are free thinkers at heart, especially the priests. Speaking of one of the latter, he says:

"He knelt down with the others, but I read his thoughts. He never speaks of his faith, but from what he says, we feel that he thinks like the rest of us. It is always thus with the priests who have studied several years in Rome. A stay there is more beneficial to intellect than to faith."

A rather slender basis for such a sweeping synthesis. And it is so through the whole work. If Dr. Brandes dealt with Poland a little more objectively we should be surer of the ground we stood on. We cannot always be sure that it is the real soul of Poland he shows us, and not its soul deeply colored by his own determinism. This tendency to base conclusions on insufficient data leads to some contradictions, especially in his graphic and powerful presentation of the characteristics of Polish women. Thus in one place he describes them as cold, with but little temperament, like the placid Englishwomen of Bourget's "Cosmopolis," while in another we are told that they are impassioned, absorbed in intellectual enthusiasms, born to rule, keeping the national spirit at a white heat far more effectively than their husbands or brothers could ever do. Indeed, Dr. Brandes considers the women of Poland decidedly superior in passion, courage and energy to the men. After reading his glowing account of their perfections we do not wonder at Bismarck's decree prohibiting a German who had married a Polish woman from buying an estate in Polish Prussia. "Experience teaches," said the Iron Chancellor, "that such a wife makes her husband a Polish patriot in the twinkling of an eye." The last nine chapters deal with the literature of Poland. As a disciple of Taine, Dr. Brandes regards literature as the expression of society, and as Polish literature is determined by the character of the Polish people, its greatest interest lies in the fact that it affords a clue to that character. The author's treatment of the subject is subtle, brilliant and delicate. Only a man of genius could give such a fascinating and satisfying picture of a great literature in a little over a hundred pages.

The Canterbury Pilgrims. A Comedy. By Percy MacKaye. New York: The Macmillan Co., \$1.25 net.

Mr. MacKaye has made a kind of *tour de force*, somewhat resembling a play, in which he has succeeded rather dexterously than otherwise in catching a little of Chaucer's spilt and compounding it together with a few historical ingredients into a brew of his own. He has integrated Chaucer himself with the *personæ* of the "Canterbury Tales," and let the characters and occasion, as suggested by the Prologue, serve as material for an action. The hints are well taken; the Miller, for instance, breaks a door with his head, the Wife of Bath appears in her big hat, spurs, and what not, while the Prioress's brooch serves to hinge the intrigue on. All this, however, ingenious as it is, does not necessarily make literature. The fabric of the piece is pretty slight; the characters, while recognizable, are far from solid, with the exception of the Prioress, who casts a perceptible shadow—indeed, the main interest consists in what the estheticians call recognition. If there is one symptom of literary decline surer, tho more subtle, than another, it is a taste for the merely ingenious—the making of patchwork out of all sorts of incongruous odds and ends.

Everyman: A Moral Play. New York: Fox, Duffield & Co., \$1.00.

Of late years there have not been lacking some curious indications of a renewed interest in allegory and symbolism. Perhaps this interest, which is altogether too slight to constitute a movement or a revival, might be traced, if it were worth while, to the influence of Ibsen's "Peer Gynt" or "Brand." However that may be, such recent instances as Hauptmann's "*Versunkene Glocke*" and Sudermann's efforts in emulation of it are too well known to require emphasis. With these productions it is interesting to connect some of the work of Mr. Yeats and the other Celtic revivalists. While the production last winter of the morality, *Everyman*, may be looked upon as indicating our English participation in this same *velleité*, from one point of view this recrudescence of the allegory is no very encouraging sign. Nothing

could show more clearly the trouble and uncertainty into which the *Zeitgeist* has fallen than the recourse to so vague and indeterminate a form of art, which floats so vaporously in the uncouth inane. But there is an aspect in which the matter looks more cheerful, and that is as a revolt from the horrors of naturalism. In this regard it is particularly interesting to find Hauptmann, the author of "*Die Weber*" and some of the most squalid of contemporaneous European dramas, rising every now and then into this other atmosphere. People are beginning to recognize that there are more things even in earth than were ever dreamed of in Zola's philosophy—things that the elastic historical novel itself cannot stretch to and for which there is no form wrought out as yet. In the meanwhile, then, the writer is obliged to clothe these elusive intimations of his as best he can in the voluminous and equivocal folds of allegory. In view of these considerations, whether conscious or not, readers will probably find considerable interest, crude as is the play itself, in this handsomely printed edition of *Everyman* and its reproduction of old woodcuts.

The True Estimate of Life. By G. Campbell Morgan. New York: Fleming H. Revell Co., 80 cents net.

Dr. Morgan is not a great prophet, he is not a great teacher, he hasn't even the rude eloquence of a Parker, nor the rugged force of a Moody. To those outside of the church, and out of touch with the conventional religious ideas of the time, he has no message that is likely to be heard or heeded. But this is far from denying him a place among the positive religious forces of the day. For if the Church needs men who can speak with power to the outside world, it needs even more men who can speak with power and conviction to those who are within its walls. If it needs breadth, it needs much more intensity, vitality, the passion for reality, and these latter qualities are present in Dr. Morgan in an eminent degree. For him the common religious beliefs are overmastering convictions, the postulates of religious faith are overshadowing

realities, and his mission is to make them real and commanding, not to those who deny them or demand reasons for their existence, but to those who passively accept and confess them, and then practically ignore them.

Shakespeare and the Rival Poet. By Arthur Acheson. New York: John Lane, \$1.25.

Mr. Acheson proposes a rearrangement of the sonnets, decides for Southampton against Pembroke and others, dismisses Mary Fitton for an unknown innkeeper's wife as the "dark lady," and brings new evidence to prove George Chapman the "rival poet." Professor Minto had long ago indicated Chapman, and the new references brought forth by Mr. Acheson would seem to settle the question definitely. Not so much can be said for his other conclusions. With an over-fertile ingenuity he reads into certain passages unnecessary, and sometimes impossible, meanings. For instance, the allusions in the twenty-first sonnet to the use of extravagant conceits in the praise of a mistress are held to mean Chapman. Yet they might equally indicate any one of a half dozen contemporaries. As Mr. Main, in his scholarly "Treasury of English Sonnets," shows, a like extravagance is found in Spenser, Daniel, Barnes and Davies of Hereford, and, as Mr. Rolfe points out, in Griffin and Constable as well. Furthermore, Shakespeare's

"As those gold candles fix'd in heaven's air"

can hardly be a play upon certain expressions in the thirtieth stanza of Chapman's "The Amorous Zodiac." The metaphor of candles for stars was a favorite one with the master, and is to be found elsewhere in "The Merchant of Venice," "Romeo and Juliet" and "Macbeth." The identification of Holofernes, in "Love's Labor's Lost," with Chapman has much to recommend it, and many of the suggestive passages in the work of the two poets are shrewdly interpreted. But the author has confessedly only a partial acquaintance with Shakespearean criticism, and he omits or overlooks much

that is relevant to his argument. His reasoning, moreover, is often irritating, on account of its violent and unexpected leaps from premise to conclusion.

The Diseases of Warm Countries. A Hand Book for Medical Men. By Dr. B. Scheube, late Professor at the Medical School, Kioto, Japan. Translation edited by James Cantlie, Lecturer at the London School of Tropical Medicine. Second revised edition. London: James Bale Sons & Davidson, Ltd

Since the predominance of England in South Africa has been assured and the expansion of the United States into the American tropics and the South Sea became a fact there has been an awakening of interest among English-speaking peoples in the diseases of warm countries. Dr. Scheube's book is likely, then, to have a much wider audience than it would have had a few years ago. It will prove thoroughly worthy of this wider circle of readers and is especially interesting because of its valuable data as to the comparative pathology of different countries which it contains. There are a number of diseases incident to temperate climates which prove to be almost entirely unknown in the tropics. This is indeed so remarkable as to make it clear that the old idea of the tropics being uninhabitable for white men is not true, since there is a compensatory absence of many infectious diseases that cause high mortality in cooler climates. Now that malaria and yellow fever are to be limited in their distribution by careful precautions against the mosquito, the tropics will be rather desirable places of residence for individuals especially susceptible to specific infections. Rheumatism, for instance, scarcely exists in the tropics at all and is especially infrequent in the Philippine Islands. Scarlet fever, the scourge of children in the temperate zone and the cause of many an adult death in the prime of life because of subsequent nephritis, does not occur in the tropics at all. Curiously enough, whooping cough, often thought to be a disease of cold weather, is especially frequent and often fatal in the tropics. There is no doubt, however, that the more careful study of disease brings out the fact that the tropics are by no means the unhealthy regions for the white men they have been

considered, and that the surplus population of the crowded temperate zones may well find its way with our present sanitary knowledge into the equatorial regions without necessarily succumbing to tropical diseases.

Literary Notes

GINN & Co. issue a handy little Guide Book to Boston, by Edwin M. Bacon, which was prepared specially for the Convention of the National Educational Association. It contains unusually copious map material.

.... "The Great Hoggarty Diamond" now appears in the Dent-Macmillan Thackeray. We have already called attention to the excellent qualities of this edition. (The Macmillan Company, \$1.00.)

.... Part VIII of *Representative Art of Our Time* with original etchings and lithographs, also reproductions of oil and water color paintings, pastels, etc., has just been issued in the Studio Library by John Lane. Price, \$1.00 each part.

.... "The Poems and Verses of Charles Dickens" have been collected and edited, with biographical notes, by F. G. Kitton. Not many readers, we suspect, know that Dickens wrote sufficient verse to make a fair-sized volume. (Harper & Bros., \$2.00.)

.... Miss Gertrude F. Lynch, whose short stories have appeared from time to time in the *Smart Set* and elsewhere, has joined the growing throng of authors whose work has been given the dignity of book form. The story of an ingénue by her, deals with prominent public characters in Washington political life, and has for its taking title "The Fighting Chance."

.... "Fanny Crosby's Life Story," by herself, a work of 160 pages bound in cloth, has just been issued by the Every Where Publishing Company, of Brooklyn, N. Y. The volume contains an account of her very interesting life, and has something to say regarding her acquaintance with Henry Clay, William Cullen Bryant, Horace Greeley, Gen. Winfield Scott and Grover Cleveland.

.... A timely book on "Radium and other radio-active substances, with a consideration of phosphorescent and fluorescent substances, and the treatment of disease by the ultra violet light," by W. J. Hammer, is just published by Van Nostrand (N. Y., \$1.00). The progress in the field is too rapid for a book of permanent value to be written on the subject, but this gives an interesting account of the discoveries and practical applications of the new rays, illustrated with numerous pictures of apparatus and radiographs.

Pebbles

ALL the world hates a good example.—*The Scientific American*.

.... "Did the whisky you gave your dog phase him at all?" "Well, rather! It gave him the collie wobbles horribly." — *Yale Record*.

.... It can't be such a feat that the hairs of our head are counted, but do you suppose any one knows how many bugs we eat in our berries?—*Atchison Globe*.

.... *Editor*: "I am sorry to hear, parson, that you are displeased with the church announcements in our last issue." *Parson*: "Displeased! Read this, sir. 'Next Sunday evening the Rev. Mr. Parsons will speak upon the evils of strong drink. The address should be well worth hearing, as Mr. Parsons is always full of his subject.'"—*The Christian Herald*.

.... It was on the glorious Fourth. "Waiter," said the serious man, "I am well aware that this is the day we celebrate. It is the day when the firecracker snaps, and the horse pistol booms, and the impatient rocket soars into the empyrean. And yet this fact can't excuse everything. It is folly to imagine it can. There is a tendency to overdo the thing. Do you understand my meaning?" "Yassir," said the smiling waiter. "Good. And you admit that I ordered apple pie?" "Yassir, you ordered apple pie." "Then what'n the name of the Declaration of Independence do you mean by bringing me this piece of punk-in-pie?" And he held aloft on the tines of his fork a bit of the material that small boys use to light their firecrackers.—*Cleveland Plain Dealer*.

THE SOCIETY COLUMN OF THE FUTURE.

It is rumored that Miss Myrtle Roxleigh and Mr. Wadsworth McMoneys are to be married this month. Miss Roxleigh, it will be remembered, had her maiden name restored last April, when she was divorced from Mr. Richman Banks. Before her marriage to Mr. Banks she was Mrs. Willie Trimble, having separated from Mr. Trimble in order to permit him and Miss Gladys Longhreen to marry. Society still remembers with pleasure the delightful house parties Miss Roxleigh gave before her divorce from her first husband, Mr. Buffington Spuds, and it is hoped that after her coming marriage the lady will return to her former style of entertaining. Mr. McMoneys has never been married very much, having been divorced but twice. His first wife is now the popular Mrs. Craigford Stillington. The lady who succeeded her as Mrs. McMoneys is, we believe, engaged to Mr. Lottson Gobbs, the latter having figured as the correspondent in her divorce case, which was decided last week.—*Chicago Record-Herald*.

EDITORIALS

Leo XIII

THE passing of Pope Leo is an event that affects the whole world. No more human man has been seen for a round century. Our first feeling is always of his universality. His death will be felt by Protestants more than Catholics can imagine. It will not be hard to think of Mohammedans and Buddhists holding a funeral service in his honor. If he has ever wounded his enemies needlessly, we have no recollection of the fact; if he has ever failed to take advantage of an opportunity to make any one happier, it has never been recorded. As a consequence Protestants have softened; they no longer show the old hatred for the Papacy. Presbyterians have deliberately taken out of their Confession of Faith the reference to the Pope as "Anti-Christ." We are not any more willing than before to admit the claims of Rome; we admit the overwhelming claims of a good and wise man to rule our hearts.

Among keen sighted statesmen Leo has held his own, and this has been no simple task, for no age ever before developed greater leaders. Bismarck honored him with his friendship, and Gladstone was a warm admirer. He did not waste his strength in proselyting, but did all that, and more, by winning our hearts. Republicans will not forget that he read the age and comprehended that despotic government had gone forever. "Christian republicanism," he said, "is the future; it will not be unfriendly to the Church. Cultivate it." His vision was broad enough to see over hereditary prejudices. But better yet, he understood the separation of church and state. He wrote wisely to his bishops that they should always sustain legitimate governments. He has not set himself against all investigation; he has encouraged study and modern methods of research. Galileo is no longer on the Index. Leo exalted the spirit without despising the letter. A Catholic writer said of him: "He blessed our beads as if he were blessing the owner of the

beads. And," he added, "it transforms a churchling into a Christian to come into contact with the Pope." In every way Catholicism has grown more intellectual and spiritual under his influence.

His humor was an ever-flowing source of joy, and a stimulant of peace. Every picture of the Pope bore a gentle smile. Leo looked his cheerful kindness for all the world. It was the peace of faith in the age. He was not worried, because he had seen that God works in all times, in all men, and in all events. With all this geniality and humor, there was a deal of the spirit of good fellowship. Leo could joke as well as Lincoln; and possibly it was for the same reason. It helped him to lift and bear his cares.

His long life, combined with these elements of character, created a very perceptible sentiment throughout the world that Leo was especially designed to promote universal religious peace. He has contributed much to establish civic peace. His predecessor was hot-headed and impetuous, provoking conflict and placing emphasis on antagonisms. Leo has substituted patience, and waited for time to work out problems. He has brought to the front everywhere thoughts of love, and the spirit of placability.

His civic rule was generous and sympathetic with the populace. Jubilee festivities have not been matters of form, but of love. "Give orders," said the Pope at his annual dinner to one thousand poor people, "give orders that the speeches be cut short; but open the larders wide." He preferred to be known as the people's Pope, and has so expressed himself again and again.

As author, Leo will have an assured place. His poem on "Health" was a remarkable production. Ill diet is a breeder of unrighteousness; why, then, should not the head of the church preach good living as well as good doing? The motto of the poem is "Shun Grief! Be content with sparse and frugal fare!"

"Neatness comes first. Be thy spare table bright

With shining dishes and with napkins white.
Trust not o'ermuch the rosy god; in fine
Be sure that you put water in your wine.
Pickèd be thy grain, and pure thy home-made
bread;

Thy meats be delicate and dairy fed.
Tender, not highly spiced thy food; nor tease
Thy taste with sauces from Aegean seas.
Nor shun the bowl of foaming milk that feeds
The infant, and may serve the senior's need.
Next on the board be heavenly honey placed;
And sparingly of Hybla's nectar taste.
Let rose-red apples crown the rustic board."

It is not easy to find out in what field of work Pope Leo was not busy. Not long before his death the Romans discovered that he was a zealous farmer. In his native province he owned a large land holding and personally directed it. He expressed himself with all the force of objugation, when his steward proposed to cut down some old chestnut trees. The revenue of his farm was spent in building or improving cottages for his laborers. In other words, he lived close to nature. His was a life of proved fidelity to God and to humanity. He won his way into the hearts of Protestants and free thinkers, as well as Catholics.

Leo's last Latin poem, which we published a few months ago, can most fittingly end this our tribute. The translation is by the editor of THE INDEPENDENT:

LEO'S LAST PRAYER.

Leo, now sets thy sun; pale is its dying ray;
Black night succeeds thy day.

Black night for thee; wasted thy frame; life's
flood sustains
No more thy shrunken veins.

Death casts his fatal dart; robed for the grave
thy bones
Lie under the cold stones.

But my freed soul escapes her chains, and
longs in flight
To reach the realms of light.

That is the goal she seeks; thither her journey
fares;
Grant, Lord, my anxious prayers,

That, with the citizens of Heaven, God's face
and light
May ever thrill my sight;

That I may see thy face, Heaven's Queen,
whose Mother love
Has brought me home above.

To thee, saved through the tangles of a peril-
ous way
I lift my grateful lay.

A Revival of Individualism

It is due. We need it. There are signs of its coming.

When individualism meant the creed of unrestrained selfishness, the warmer human instincts revolted and demanded consideration for the social point of view. The let-alone policy can be carried so far that nearly every iniquitous thing is allowed to flourish insolently. But when individualism has been decried until men have forgotten that the individual is, after all, the supreme end for which the social order exists, it is time to recall them to their right minds. When the community itself becomes a lawless tyrant it is necessary to proclaim the standards of civilization against barbarism, for the recrudescence of collective tyranny is a return from enlightenment to barbarian darkness.

It is not only the trusts and the labor unions that are trampling on individual rights; it is also unorganized bodies of men, entire neighborhoods crazed with mob spirit, and arrogant in the belief that some sacred interest must be safeguarded by crushing or exterminating a hapless individual. Every lynching is an appalling outburst of mass tyranny. Tyranny in the industrial world and mob tyranny are closely allied. Both are manifestations of one spirit. Barbarian clan vengeance, theocratic ruthlessness against heretics, and union denial of individual judgment are all a part and parcel of the same raw stage of social evolution.

These collective tyrannies are barbarian not only because of their violence, but even more because of the primitive thinking from which they spring. Subordination of the individual to the community is justifiable only when society is in peril. Through long ages every human community lived in such continuing danger that the instincts of men became adjusted to collective authority.

To the extent that the life of a neighborhood or of a class is really threatened to-day, the return to mass tyranny is comprehensible. But danger is not often proportional to panic. It is absurd to claim that life and virtue are so menaced in the South and West that the ordinary machinery of the law cannot afford protection. It is preposterous to say that competition in the East has ever driven so large a proportion of business concerns into bankruptcy that trusts must now suppress individual enterprise. It is a sad fallacy to assume that the organization of labor is in greater danger from external opposition than it is from its own folly in depriving its membership of individual liberty.

Failure to perceive these tremendous truths is one of the surest marks of intellectual narrowness. With it is always found a nearly complete failure to appreciate the possibilities of individual life. The essential nobility, the beauty and the sanity of a self-directed, untrammelled personality have never yet been comprehended by the multitude. Not understanding it, the multitude cannot easily believe that men left to their own direction would attain loftier heights of intellectual and moral achievement, to say nothing of practical success, than they possibly can achieve under dictation from without. The multitude loves to mind everybody's business; and it has an overweening confidence in its own executive ability.

We need the revival of individualism, then, for many reasons. We need it because collective dictation is throttling enterprise and originality to an extent that will react disastrously upon our industrial supremacy, as already the same folly has injured irremediably the industrial position of England. We need it because we cannot keep on violating the fundamental principles of our constitutional law by collective outrage without undermining the whole structure of our institutional life. But above all we need it in order that once more we may nourish men of original power, of fearless outlook upon the world, of calm courage to follow the light of conscience and of reason.

The signs that we are to have such a revival are multiplying, in the restive-

ness which strong-minded men are showing to-day under the trammels which bind them. It is beginning to be realized that the American people has enslaved itself to organization, and that this master can be as unmerciful as any despot whose scepter has been broken in the past. Other signs are manifest in the growing indignation of decent citizens at the outrageous creed which affirms the rightfulness of summary methods to assert the collective will against nonconforming individuals, even those of criminal instincts. The moment the sacredness of individual personality is denied, rational methods of maintaining law and order are forgotten. One other sign of the coming revival is now hardly perceptible, but we believe that it will grow until none can mistake it. It is a fresh upspringing in the minds of men of the wisdom which sees that thought, conscience and aspiration are the natural heritage of mankind; and that under perfect freedom they can never in the long run, or in a majority of instances lead individuals in any other paths than those of righteous living, and idealistic effort.

The Re-Formulation of Science

To the intelligent reader who takes an interest in the progress of science, but has not himself had any thorough scientific training, the present state of scientific thought, as exhibited in such a discussion as we reported last week, must seem mere chaos and confusion. He hears one distinguished scientist explaining all physical phenomena as due to the motion of atoms and another, equally authoritative, says the idea of atoms is childish and futile. One book makes the periodic law the foundation of all chemistry; another relegates it to a footnote. One biologist writes of the almightiness of natural selection; another of its inadequacy. The ordinary man concludes that since doctors so disagree, none of them know anything, and that it is impossible to put faith in science, for what is held to be proved one year is overthrown the next.

This idea of the extent of confusion and uncertainty in the realm of science comes from the failure of the general

reader to understand how facts and theories are held and used in science. In reality, the advance of science for the past two hundred years has been continuous, one man building on the work of another, as a row of bricks is set on the one below it, and without any fear of the foundations giving way. When we enter a library of astronomy, natural history, chemistry or physics, we see around us thousands of volumes, and we may be quite sure the number of important errors in them is so small as to be negligible. Indeed what strikes the modern reader as he takes down the first yellow and leather bound volumes of some two-hundred volume set of a scientific journal is the remarkable accuracy of the work done by these pioneers in spite of their ignorance of modern methods and lack of our facilities. Cavendish's account of his experiments with "dephlogisticated air" which unites with "phlogiston" to form water, sounds very absurd to us, but if later chemists had been as thorough as he, they would not have overlooked for a hundred years the traces of argon, which he discovered in the air.

The great revolutions in scientific thought are not, then, due to any discovery of the falsity of the facts, but to the necessity of every growing science to construct new and more adequate theories and formulas. To understand this it is necessary to comprehend the peculiar way in which a scientist uses his theories. To an original thinker, theories are not considered as true or false; they are merely more or less useful. He no more thinks of asking his pupils whether, for example, they believe the atomic theory, than of asking them whether the atomic theory is blue or red. He merely teaches them how to use the atomic theory to obtain certain true and definite results. He himself handles theories as he handles apparatus, dropping one and picking up another without an instant's hesitation whenever there is anything to be gained even for a moment by the change. He talks of the sun moving around the earth one minute and of the earth moving around the sun the next; sometimes he speaks as tho electricity were of two kinds, sometimes as tho it were a single

substance, sometimes as tho it were no substance at all.

The trained scientist holds his theories just as the skillful driver holds his reins, with a grip that is at once firmer and looser than that of the ordinary man. It would be hard to match in the theological world the dogmatism and intolerance of the half-trained scientist, such as is too often found in our high schools and sometimes even in colleges. He holds to the infallibility of the law of gravitation as strongly as the good Catholic holds to the infallibility of the Pope. He argues as fiercely as to the proper number of valences of oxygen as the ritualist argues for the proper number of fingers to be used in benediction. To such a man a re-formulation of his fundamental conceptions is a difficult and dangerous operation, liable to be fatal if attempted too late in life. The discovery of bodies smaller than atoms comes to him with a great shock like the betrayal of his confidence by a friend. He feels ashamed to meet his classes after the exposure, for he has been teaching them that atoms are little round, hard things which cannot be cut in two, as is proved by the name.

Why, then, do we take the trouble to construct theories, since they are so soon outgrown? Simply because they are necessary, altho they are so transitory. It is impossible to systematize and store away, either in books or in the mind, a great mass of verified facts without some general scheme, and the exploration of the unknown, the true task of science, is in most cases futile and ineffectual without the guidance of hypothesis. For a theory to be useful it is not necessary for it to be true—using the word true to mean capable of interpreting all known facts. The laws of mirrors and lenses were worked out, and even now are most simply explained, on the theory of Newton, that light consists of small particles driven in straight lines from the object to the eye, altho that theory was shown to be false—that is to say, inadequate—when the phenomena of interference and polarization were studied.

An old text-book of science is, then, useless, not so much because of its errors, which are generally not numerous or important, but because it is antiquated

in its phraseology, and a new formulation of science, altho it may be verbally contradictory of the older, represents really a different way of looking at the same undisputed facts. For example, we may regard a block of stone as something heavy, cold and square, or as a system of atoms moving like the planets in their orbits, or as a cubic foot of volume energy, or as a collocation of forces acting from undimensional points, or as a mental concept of the observer. It makes no difference; it is all the same stone whichever pair of spectacles we use. In its spiral course upward, the current of human thought sometimes flows in opposite directions, and there are those who think that no progress is being made, but usually the opposition is merely apparent. When a man starts in to study botany the first great discovery he makes is that all the leaves on the same tree are alike; the second discovery, equally true and important, is that no two of the leaves on the same tree are alike. History is being made rapidly just now in the scientific world, and the conflict of conceptions is being hotly fought. It is important the spectator keep in mind the real significance of the changing views and to remember that in science revolutions never go backward.

The Passing of Farmington

PERHAPS there are people still living whose memory dates back to a time when Miss Porter's school at Farmington did not hold among "finishing schools for young ladies" the unique place that has been its own for generations of pupils. Miss Porter's was more than a school, for it was a survival, a connecting link, an institution, an influence. The creation of a sister of the late President Porter, of Yale, Miss Sarah Porter, perfect type of the old-school gentlewoman, cultured, religious, dignified, dominating, and envired in the quiet beauty of a simple Connecticut village, the school grew with her growth through sixty years of consistency with itself. Recognized more and more as standing apart sufficient unto itself, seeking only the patronage of those who cared for what it

had to give, Miss Porter's school paid small heed to what experts call "the requirements of a modern education," and scorned the prestige of mere fashionable favor it might have had for the seeking. Offering the best of opportunities, it made little of exactions as such. Purposed or not, the education at Miss Porter's was one of association far more than of discipline.

Doubtless many of its graduates have left Farmington woefully deficient by certain standards. On the other hand, they carried away what mere standards can never give, ideals of the meaning of life, appreciation of culture and gentle breeding, and love for the place and the traditions that there found a natural home. Thus it came about that the 125 girls or so composing the school were for the most part daughters or relatives of the "ancients"—the graduates; that, in fact, admission was a privilege extended to few outside the immediate family circle. Reverence for the personality there embodied, recognition of the charm and value of her work, found concrete expression in the Leslie Hunsicker memorial library, the gift of ten friends; in the studio with its music rooms, the gift of other friends; in the beautiful parish house for the Congregational Church, of which Miss Porter's father was pastor, a special memorial to her from the graduates; and in the organ for the church, the gift of an unnamed graduate. The inspiration of the school led to forming in various cities, from New York to San Francisco, of branches of the Farmington Sewing Society, and to establishing near the school the Farmington Lodge, a vacation house for working girls; while on another side a small circle founded the "Ancients' Club" as a home for their frequently recurring visits to Farmington.

Since the death of Miss Porter, about three years ago, the distinctive life of the school has continued unbroken under the principalship of Mrs. Mary E. Dow, her trusted associate for twenty years. The future of Farmington seemed thus assured for at least another generation. The disillusion came with shocking suddenness through the announced decision of the residuary legatee to assert his legal rights and assume active control, altho, as we are informed, Miss Porter

expressed in her will an intention, whatever the legal purport, to safeguard Mrs. Dow's continuance as head of the school and to ensure her a share of the profits. This legatee was Miss Porter's nephew, Dr. Robert Porter Keep, a distinguished scholar and educator, for many years principal of the Norwich Free Academy. But despite legal rights and acknowledged qualifications, Dr. Keep's decision provoked a literal storm of opposition to Mrs. Dow's virtual displacement. One formal protest was signed by every girl in the school but one, and another by eighty representative citizens of Farmington. But none of these things moving Dr. Keep, Mrs. Dow, taking with her most of her staff of teachers, will this fall become identified with another school on the Hudson.

"But yet the pity of it, Iago!" Dr. Keep's school, however excellent, will probably be a radical departure. Mrs. Dow's school, however successful, can never transplant to the new abiding place the associations and traditions of the old. How different might have been the story had Miss Porter realized that her school had grown into an institution. That is something far too precious to trust to individual control. To preserve and conserve an institution there exists only one adequate instrument, the corporation, that self-perpetuating, slowly changing body of trustees, which moves steadily on along settled lines of consistent policy, whatever the inroads of resignation or death.

Our Internal Refrigerator

It is not often that a discovery of science is so timely as the announcement now made that we have a cooling mechanism in our bodies, and we are grateful that this information comes quite opportunely to encourage us during the good old summer-time.

It is well known that the human body is an extremely perfect form of that scientific instrument known as a thermostat, and that it keeps its normal temperature of about 98.6 degrees F., no matter what is the temperature of the air around us. The internal temperature of the body fluctuates only a few tenths of a degree in health and a variation of a few de-

grees is fatal, yet man can live and maintain his health where the thermometer stands 100 degrees below or 10 degrees above the point at which the body must be kept.

It is easy to see how a temperature higher than the surrounding air can be kept up, for all foods are fuels, and the human body, when it converts them into carbon dioxide and water, gets just the same amount of heat out of them as when they are burned in a stove to the same products, but to explain how we can keep cooler than the air is more difficult. The evaporation of water from the skin and lungs is a very important cooling agency, but sometimes the air is saturated with moisture and no relief can be obtained by this means. Under these circumstances there is less carbonic acid given off in the breath, and we use—or should use—less food, but while this lessening of the fuel supplied to the body and of the rate of consumption cuts off somewhat the production of heat, this does not account for the fact that the body can remain colder than its surroundings. To do this, Lord Kelvin points out, there must be a real absorption of heat, and this seems to involve a reversal to some extent of the usual process of katabolism, or, in other words, we must have some way of cooling the body by internal processes. Otherwise it would be impossible for men to live, as they do in the tropics, where the temperature may be over 100 degrees F. for a long time and the air almost completely saturated. The internal temperature of frogs is more variable than it is in man, yet it is found that a live frog almost completely immersed in warm water will remain colder than the water for a long time, while a dead frog very quickly comes to the same temperature as the water.

As it is a mystery why radium can keep warmer than the objects with which it is in contact, so it is equally unexplained how a living body can keep cooler than its surroundings.

This affords an opportunity for the unscientific mind to indulge in much comforting speculation at this season of the year. Why can we not have some sort of a pill which will act in a stimulating manner on this refrigerating gland

or whatever it is, and take the place of the large quantities of ice cream soda now used for the purpose? Or, since we are making such astonishing progress in the development of the power of mind over bodily functions, why can we not hope to keep cool by merely thinking about it? It is well known that the mind and the emotions can make marked changes in the heat of parts of the body by acting through the regulating centers in the base of the brain. We get cold through fright, and warm from embarrassment. Let us devote the rest of vacation to developing this neglected organ, and keep cool.

Old Age Pensions

THIS topic has not yet so seriously taken hold of the American public, because we have not yet felt the full force of poverty as it is manifested in European States. We are, however, probably approaching a time when, as an economic question, it must be considered. The nineteenth century took up the case of the young. It was conspicuously active in determining a happy entrance into the world and a fair start into citizenship. It went from common schools to free schools, and then to compulsory education for every child in the land. Childhood is protected by statute from all sorts of abuse and from labor during the school years. We have probably carried legislation somewhat too far in the way of restraining parental authority in the matter of home education, as well as home control of labor.

Indications are that we shall soon turn our attention to the other end of life—to second childhood. Nothing in this world is so utterly helpless as an old worn-out man or woman without resources. It must be borne in mind that the word charity means something very different from what it did fifty years ago. It involves not only the idea of caring for the poor and the helpless, but caring for them *judiciously*. The old idea of charity as a supposed remedy for poverty was a total failure. It was demonstrated that the whole vast burden of giving had only increased misery and fostered pauperism. Help must come from within,

not from without. The poor must be enabled to help themselves. Charity is today an economic question, rather than a religious question. Therefore when Germany proposed to pension old age, she did not thereby mean a vast scheme of public benefactions, but the establishment of a system of savings that would insure to each person a living moiety when old. The individual was to be appealed to to foresee his own possible state of helplessness—those years when his wants could not be provided for by his work. A degree of paternalism was to be exercised—that degree which would not allow the appeal to reason to have failed of accomplishing its purpose. A growing conviction has for some time been gaining ground, not only in Germany, but in England and in America, that all pensions and pensioning should be placed upon some such ground as this. England argues that it would be cheaper to assist its pensioners to self-support than to grant them outright a specific gift. New Zealand has taken another stand. It assumes that the care of old age is purely a matter of justice.

“Whereas it is equitable that deserving persons, who, during the prime of life have helped to bear the public burden of the Colony, by the payment of taxes, and to open up its resources by their labor and skill, should receive from the Colony a pension in their old age.”

This is the preamble to the statute by which the pension has become an established part of New Zealand economics. There is no question here of charity, but, on the other hand, there is no hesitation to grant outright a pension as a debt. The grant is given by the community to its aged members purely as a matter of justice and right. They have by honest work established a claim on society; a claim, not to charity, but to a regulated share of the sum of public wealth. They are producers who have ceased to be able to add their annual quota to the common weal.

It is open to a good deal of debate whether this is broader ground than that taken by Germany. While one undertakes to make the individual provide for his own future, the other offers such provision from the State treasury. The difference, however, is not so great as at first appears, for New Zealand presumes

that any honest old person has already worked his share and has practically invested his earnings in State wealth. The honest old person is supposed to deserve in all equity to be cared for. His toil, his skill and his good will have not been invested in insurance policies, but have been invested in the country's prosperity. It will pay the public to spur every citizen to industry by the hope of provision for old age. This is the New Zealand idea and it savors strongly of advanced socialism. Germany, on the other hand, does not put such unlimited confidence in her laborers, nor does she place the same estimate on the work of the average citizen. In this country our earlier training will lead us to favor the German idea, altho we should shrink probably from the exercise of paternal control of a man's wages. We can easily see the force of New Zealand logic on the other hand that considers second childhood quite as much the care of the State as first childhood.

By the New Zealand statute the sum of \$170.00 is taken to be the average of individual income. The pension is to be decreased five dollars for every five dollars income in excess of \$170.00. The pension must not exceed \$260.00 per annum, while its mean sum must not be less than \$90.00. It was thought that the applications would not exceed 6,000 persons for the whole colony, and this estimate proved to be very accurate. The question still remains whether the patriarchal system as expressed in this act will not tend to increase the number of applicants gradually but surely. Will the law pauperize public sentiment? Will another result be to create a pension lobby to affect legislation? Will this lobby secure larger appropriations, and to a larger constituency, until the generosity of the people has become an excuse for a general system of plundering the public? There is much to be said on the side of the laborer, that the lion's share of industry goes to capital, and that it is only a partial equalization of rights to take care of the worn-out laborer in his decrepitude. Anglo-Saxon independence does not yield this point readily. The whole system of pensions becomes dangerous when it is a direct draft upon the Treasury. German sociologists insist

that their system is the safest, while it is at the same time developing the manhood of recipients. One authority says: "It is the most valuable social institution of the Empire." The *Berlin Echo* some time ago expressed its conviction that, "during the past fifteen years, no act has been put in force in Germany more advantageous to national character." It went so far as to trace the decrease of strikes to an increase of interest in capital. The system of compulsory insurance makes of nearly every man in the Empire a capitalist.

The feature of the German law that jars upon American instinct is that of compulsion. We have, however, accustomed ourselves to believe in the wisdom of compulsory education for children; it may not be much more difficult to adjust our ways of thinking and feeling to compulsory insurance for old age. The amount deducted from daily wage would scarcely be felt in this country, while the man who parted with the moiety would feel that he had in so far added to his standing as a citizen. England has for some time been working at the problem of old age pensions, but is as yet unable to determine the most available method of adjusting the proposition to English conditions. There seems to be little doubt of the ultimate acceptance throughout civilization of the general principle that old age should be protected and cared for in its weakness. Each nation will, however, be compelled to shape the problem to its own economic conditions.

Lynch Law and the Militia

Through all the fog that obscures, in the minds of many, the real character of the offense which lynchers commit sounds the clear note of Justice Brewer's denunciation: "Every man who takes part in the burning or lynching of a negro is a murderer and should be so considered in the eyes of the law." The Justice is doing his duty in thus telling lynchers what crime it is of which they are guilty. It is the duty of all intelligent and law-abiding men to use for the restraint of the lawless, and those who are misled as to the character of lynch law executions, such influence as they can exert. No groups of citizens are now in

greater need of restraint and of enlightenment as to the fundamental safeguards of civilization than those labor unions in Indiana who have demanded and procured the dismissal from their places of employment of citizen soldiers who, as in duty bound, defended the prisoners in the Evansville jail and themselves by firing upon the lawless and crazy mob that had already attacked them. It seems almost incredible that American workingmen should thus strive to promote anarchy. Unfortunately, however, it is known that the attitude of the labor unions in Indiana toward the militia of the State for a year past has been in accord with this recent manifestation of their hostility in Evansville. Even in South Carolina they can learn something from the sheriff's daughter who drove away a lynching mob with her father's rifle. The people of Indiana should see to it that these dismissed militiamen of Evansville do not lack profitable employment, and the laws of the State, which appear to be adequate for such cases, should be enforced against the cowardly employers who discharged them.

Again the Deadly Toy Pistol

By a hasty inspection of dispatches in the daily press last week we found reports of 98 fatal cases of lockjaw, due to apparently slight wounds received on the Fourth of July. This is, of course, an incomplete record. There were 41 fatal cases in Pennsylvania alone, and it is probable that a full list for all the States would show not less than 400. Almost without exception those who suffered and died of this terrible disease were boys between the ages of five and fifteen years, and in more than nine-tenths of the cases reported the fatal wounds had been inflicted by toy pistols. These are cheaply made. The injury is due sometimes to an explosion of the toy, sometimes to a discharge that drives parts of the blank cartridge or wadding into the hand. We described this annual epidemic of tetanus in THE INDEPENDENT of July 2d, and gave such warning as we could to those who permit their children to use the deadly toy pistol. It has generally been held that the germs or bacilli of lockjaw are introduced into

these Fourth of July wounds by the agency of soil or dirt which is on the hand when the wound is made or is attached to it afterward. Because the disease is so closely associated, however, with wounds inflicted by the blank cartridges used in toy pistols, the results of an investigation made a few weeks ago by Dr. Connolly, the bacteriologist of the Newark Board of Health, should not be overlooked. He reported to the Board on July 2d that a careful bacteriological examination of two makes of these blank cartridges in his laboratory had disclosed the presence of large numbers of the bacilli of tetanus, either in the wadding or in the fulminate. This annual slaughter of American boys should cease. In some States the sale of toy pistols to minors is forbidden by law. It should be prohibited everywhere. The police of all our cities should be required to enforce such laws rigidly and to confiscate every toy pistol found in the possession of a boy on the Fourth or at any other time. It seems to us that Boards of Health could do much for the protection of the boys. The killing of 400 of them by lockjaw in July next ought to be prevented in some way.

Political Effect of the Postal Frauds

Senator Lodge remarks that the effect of the postal service investigation upon the Republican party in next year's elections cannot be otherwise than favorable. This, we think, is the sincere opinion of an active and hopeful politician. If the Senator really believed that the effect of all these disclosures and prosecutions would be depressing and distinctly unfavorable, he would probably decline to express an opinion for publication. The truth is that the political effect of this uncovering of fraud, bribery and evasion of law will depend upon the thoroughness with which the investigation is made and the vigor and success of the prosecutions. Much wickedness has been disclosed; the public thinks that there is much more still hidden. It also thinks that the Government is not inclined to turn the light of merciless inquiry upon all the offenses committed in the Department during the term of the preceding

Administration. No frauds, no evasions of law, should be left to be discovered by the Congressional investigation which will surely be made. The statute of limitations should be no bar to such punishment of the guilty as may be inflicted by showing what they did and denouncing them for it. If new laws are needed to prevent such violations or evasions of the existing statutes as have been committed by officers now under indictment or by persons who are no longer connected with the Department, the need should now be asserted and steps should promptly be taken to procure the legislation required. We are confident that the prosecution of those who have been or are to be indicted is in good hands, and that earnest and intelligent effort to give them the punishment they deserve will be made. Therefore convictions are to be expected. The effect of the disclosure of the great Star Route frauds upon the Republican party was unfavorable for several reasons, among them these: That some persons who had profited by the frauds were not prosecuted, that no one of the principals who were prosecuted was convicted and punished under the law, and that some who escaped had been prominent in the party organization. It has recently been asserted that no one was convicted. To the shame of the Government, be it said, there was one exception. A clerk, a mere tool of the conspirators, gave information to the Government upon a promise of immunity. That promise was not kept. He was prosecuted and was sent to prison for a year. But this was not done in Washington, nor were Mr. Merrick and Mr. Ker, the Democrats employed there as special counsel, responsible for it. This time some of the principals who have profited by frauds which were comparatively small will be convicted. If the law has been violated or evaded by any one prominent in the party organization, those who direct the party's action should promptly clean house by showing him the door.

The Passing of Whistler

James Abbott McNeill Whistler died suddenly on the 17th at his residence in Chelsea, London. He was born in 1834 in Lowell, Mass., and studied for a time

at West Point, but he had no inclination for military life or his father's profession of engineer, and about 1855 began to study art in Paris. His work as a painter was so unconventional that it was for years rejected by the Paris Salon and the London Academy, and his daring experiments in color aroused the opposition of the critics. In 1877 Ruskin wrote in "Fors Clavigera": "I have seen and heard much of cockney impudence before now, but never expected to hear a coxcomb ask 200 guineas for flinging a pot of paint in the public's face." Whistler at once sued Ruskin for libel, won his case and was awarded a farthing's damages. On account of his caustic wit and erratic personality, he was engaged in numerous contests in law and in print, of which he gives an account in his book on "The Gentle Art of Making Enemies." Harpers were obliged to withdraw from circulation the March, 1893, number of their magazine on account of a sketch of Whistler, which Du Maurier introduced as "Joe Sibley" into "Trilby." In addition to his paintings, of which "The White Girl" (1862), portraits of his mother and of Thomas Carlyle (1872), and the "Harmony in Gray and Green" (1888) are the most noted, Whistler produced a large number of etchings, which are easily the best done in the nineteenth century. Despite the opinions of the critics most of his fellow craftsmen considered him the greatest artist in the world at the time of his death. Whether he will rank with the masters of the ages, however, we doubt. He was too erratic.

England's Example

From a careful summary just published in the Liverpool *Daily Press* this is what the cities and towns of Great Britain are doing in the municipal ownership way: Doncaster, Chester and Lincoln own race courses. Bath owns hot springs. Bournemouth owns winter gardens and golf links and runs an excellent orchestra. Harrogate is proprietor of baths and springs, a winter garden and a theater. Leamington owns baths and a pump room. Southport runs pleasure boats on the lakes. Brighton owns a royal pavilion and aquarium. Notting-

ham and Wolverhampton possess and work sewage farms, and Colchester owns an oyster fishery. Plymouth conducts a Royal Hotel. Birkenhead owns ferry boats, and York owns a canal and a fleet of steam tugs. Manchester is the principal shareholder in the Manchester Ship Canal, and Bradford has erected a "conditioning house" for the testing of wool. Liverpool, like Bradford, makes an artificial stone from the clinker produced by its furnaces, and Leicester manufactures paving slabs. Bristol shoes horses and makes harness. Glasgow has municipalized all the common services except the cemeteries. The towns that own public market places number 228. In every instance where the control of the street railroads has been transferred from a private company to the local authorities, says the *Press*, the change has led to a better service, cheaper fares, increased traffic and larger profits, while the position of the employees has been improved both in regard to pay and the hours of labor. As regards the other "natural monopolies," the water supply is owned by 193 towns, the gas supply by 99, and the electrical supply by nearly as many. All this is England's record, and the end is by no means yet. Nevertheless we still hear in this country a great deal of talk of "socialism," "anarchy," "impracticability," etc., etc., whenever municipal ownership is mentioned. It is cheaper to learn by example than by experience.

Passive Resistance The Nonconformists in England are earnest in carrying out their policy of "passive resistance" against the administration of the new education act, which gives the established church greater control over schools supported by public money. Passive resistance leagues are being extensively organized, meetings held and large numbers are pledging themselves "to obey God rather than man," to suffer spoliation of goods and imprisonment" and "be burned at the stake" rather than have their children taught "popery," "Mariolatry" and other "abominations of priestcraft." Translated into plain English, the kind of martyrdom to be suffered is nothing more heroic than to have some article of furniture seized and put at auc-

tion, to be bid in by the friends of the "victim of conscience" in the presence of as large a crowd as the league can collect, and with the accompaniment of as long speeches on "freedom of worship" as the police authorities allow. While we would not have any man violate his conscience, even to the extent of 1s. 6d., we wish to call attention to the exceedingly dangerous character of the weapon employed. The fundamental principle of all government is submission on the part of the minority to the will of the majority as expressed in the established authority, even tho that authority may be, as it sometimes is, unrepresentative in character and tyrannical in its acts. Everybody who has any conscience at all objects to some acts of his government, and would have the same right, if such right exists, to refuse to pay taxes for those purposes. But if the anti-imperialist should refuse to contribute, directly or indirectly, to the subjection of the Philippines, the Quaker to buy war ships, the Catholic to the support of secular schools, women to a government in which they are not represented, and anarchists to everything, it would obviously be impossible for a nation to exist, and such measures are only justifiable where the action of the government is unbearably oppressive and where there seems no prospect of righting the injustice by less revolutionary means in the future. The Nonconformists, however, claim that there is an important distinction between taxes and rates, and that in the former case they contribute toward a general fund and are not supposed to know its object, while rates, such as payments for the support of schools, are made for a specific and known purpose, and they cannot conscientiously pay them if they cannot approve of the purpose.

Our Open Door Policy The foreign newspapers agree that Secretary Hay has scored a diplomatic triumph in securing the consent of Russia to the opening of two ports in Manchuria to the commerce of the world, altho those who always consider Russia's diplomacy as bottomless hold that this apparent concession covers some deep-laid plot. But whatever it may amount to, it is more than any other nation could have accom-

plished, and most of all we congratulate ourselves that it has been attained, not by any duplicity or bullying, but by the exercise of forgiveness and unselfishness to a degree hitherto almost unknown in international relations. The unprovoked attack by Government authority on our Legation was a crime unexampled in the world's history, for from the remotest times and among all nations, barbarous as well as civilized, the person of an envoy is held sacred, and any injury done him, even by an irresponsible individual or an uncontrollable mob, is counted a terrible disgrace. According to the prevailing code of international morality we should have been justified in taking a terrible revenge on China, and there was nothing in the power of that nation nor the will of any other to prevent our inflicting any punishment we desired. But, instead of taking advantage of the opportunity, either for selfish purposes or the gratification of the instinct for revenge, we abstained from the bombardment of the Taku forts, we refused to take part in the punitive expeditions, and we endeavored to reduce the indemnity demanded by the Powers to the lowest possible amount. There were many who said that this policy was neither wise nor safe, but so far it seems to have been both. The Russian occupation of Manchuria will be a good thing in some ways. The resources of the country will be developed, it will be brought under a greater degree of law and order and brought to a somewhat higher level of civilization. What is to be feared from Russia's domination is the introduction of the system of repression of individual freedom and restrictions on commerce. If, then, we can do anything toward promoting freedom of trade, it will be not only to our advantage but a benefit to the inhabitants of this part of the Chinese empire and all the commercial nations of the world. We stand for a fair field but no favors.

A Suggestion from France When Americans sit down to a grand Fourth of July dinner in a foreign capital many gushing words might be expected from the speakers, both American and foreign, in honor of this country and of the nation whose guests they may happen to be. Such was the fact when three

hundred gentlemen and ladies heard the brilliant and most complimentary speech of Mr. W. Bourke Cockran at the Fourth of July dinner in Paris. But they also heard a word from a member of the French Cabinet to give them considerable food for thought. He told them that the citizens of France pay every year two dollars apiece on the average for American products, while the citizens of the United States pay only half a dollar each for French products, and he made the suggestion that the heavy and almost prohibitive tariff which we impose on French goods should be considerably lightened in the interests of mutual advantage and good will. Our Senate has made great delay in approving a treaty of reciprocity with France, and it would be difficult to prove that any of our manufactures which are affected by it are still infant industries. The revision of our tariff ought to be a chief business of Mr. Roosevelt's next administration.

The New Comet Borelli's comet, which is now to be seen with the naked eye northwest of the constellation Cygnus, is the brightest one since Smith's comet about twelve years ago. From photographs taken at Yale its tail now is estimated to be 3,000,000 miles long, and the comet is traveling away from the earth at the rate of twenty-five miles a second. It is now about 26,000,000 miles away from the earth and has now reached its maximum brightness. Those who can should be sure to see it through a telescope.

Radium as a Cure for Cancer Dr. Mackenzie Davidson reports the successful treatment of a cancer of the nose by exposing it to radium. Four exposures of about fifteen minutes each were given at intervals of a few days. In three weeks the diseased part was healing satisfactorily and in six weeks it was quite gone, and no scar is left. The cancer was superficial, but previous attempts to stop the growth by the use of the Röntgen rays had been unsuccessful. Thus what was once of great theoretical interest now becomes of equal practical importance.

INSURANCE

Governmental Horse Insurance in Bavaria.

Recent consular reports indicate that considerable progress has been made in Bavaria during the last thirty years in the domain of Governmental insurance. Insurance by the Bavarian Government against fire was centralized and modernized in 1874. This was followed in 1884 by an insurance provision against losses on account of the devastations of hail storms. In 1896, Bavaria, in recognition of the extreme importance of the cattle industry provided Government insurance of cattle. When it was found that the provision had successfully stood the crucial test of time, Dr. Baron von Feilitzsch, the Minister of the Interior, who had previously originated both hail and cattle insurance, took steps looking toward an extension of the system so as to include the insurance of horses. This was a much more difficult problem, but it has been successfully accomplished, and a statement of accounts has been issued by the Royal Chamber of Insurance regarding the Bavarian horse insurance, which, under the law of April 15th, 1900, went into effect on November 1st of the same year.

This latest benevolent institution of Bavaria has awakened profound interest on the part of the horse owners. The initial difficulties have been well overcome, and the development of this class of insurance has been so surprisingly rapid that it may now be regarded as one of the greatest of horse insuring institutions. In common with all other Bavarian Governmental insurance, it is based upon the foundation of "unions." There are now nearly 400 combined unions, with over 30,000 horses as risks. An insurance capital is invested that has a total of \$6,822,636. The success of horse insurance appears pronounced, and it is largely if not entirely, due to the co-operation of the Bavarian Government and influential people interested in horse breeding. The management has carefully avoided all tendencies toward bureaucracy, and both the state and township officials have been,

for the most part, friendly counselors to the parties interested.

Bavarian Governmental horse insurance is by no means exclusively for the benefit of the rural classes, but is designed for city people as well. It now extends to all regions where horses are bred, and many of the cities of Bavaria are included in the unions.

JUVENAL in his satires mentions a remarkable business that was carried on in ancient Rome. It consisted of buying houses on fire. The speculator hurried to the scene of the conflagration attended by slaves carrying bags of money and others carrying tools. He judged the chances of salvage and made a bid to the distracted house owner, who was, as a rule, glad to accept anything. The bargain struck in all haste, this earliest of fire assurers set his slaves instantly to work and secured what he could. Sometimes he even put out the flames and so made a *coup*. It was a business for capitalists, but the poorest who speculated in a small way could hardly lose if he had presence of mind enough to grasp the chances. It was in this way that Crassus laid the foundation of his great wealth. He gradually collected a force of slaves trained as carpenters, masons and such artificers, which finally reached five hundred men. Not only did he buy houses on fire, but he also made a bid for those adjoining which stood in danger. His proposals, it is said, were commonly welcome, so helpless were the people and so great the peril. Thus it was that Crassus became the greatest owner of house property in Rome.

HOME INSURANCE COMPANY OF NEW YORK.

The Home Insurance Company of this city, which last April celebrated its semi-centennial, has just made public its one hundredth semi-annual financial statement. This statement shows total assets of \$17,374,644, as against \$17,108,635 six months ago, a gain of more than \$266,000. The reserve premium fund is \$6,334,679, while the reserves for unpaid losses, reinsurance, taxes and other claims amount to \$1,661,118, leaving a net surplus of \$6,378,847 which, with the cash capital of \$3,000,000, gives a surplus as regards policyholders of \$9,378,847. The President of the Home Insurance Company is John H. Washburn, and Elbridge G. Snow is Vice-President. A semi-annual dividend of 7 per cent. has been declared payable on demand.

FINANCIAL

Foreign Trade for the Year

IN the fiscal year ending on June 30th the value of goods imported into the United States exceeded for the first time a billion of dollars. The exact figures, and those of other recent years, as given in the report of the Bureau of Statistics, are as follows:

	Exports.	Imports.
1903.....	\$1,419,991,290	\$1,025,619,127
1902.....	1,381,719,401	903,320,948
1901.....	1,487,764,991	823,172,165
1900.....	1,394,483,082	849,941,184
1899.....	1,227,023,302	697,148,489
1898.....	1,231,482,330	616,049,654
1897.....	1,050,993,556	764,730,412
1896.....	882,606,938	779,724,674

The total has increased by 47 per cent. since 1896. This year it is larger than ever before, exceeding the total for 1901 by \$134,000,000, and that of 1902 by \$160,000,000. The exports (\$47,090,595) and the imports (\$46,982,027) of gold were nearly equal, but the exports of silver exceeded the imports of that metal by \$20,000,000. During the decade since 1893, imports have increased by 18.4 per cent. and exports by 67.5 per cent. The following table shows the growth of our foreign trade by decennial periods for half a century:

	Imports.	Exports.
1853.....	\$263,777,265	\$203,489,282
1863.....	243,335,815	203,964,447
1873.....	642,136,210	522,479,922
1883.....	723,180,914	823,839,402
1893.....	866,400,922	847,665,194
1903.....	1,025,619,127	1,419,991,290

The agricultural exports of the year (\$782,866,305) have been exceeded only in 1892, 1898 and 1901. Increase of imports was due largely to the purchase of foreign materials, raw or partly manufactured, for use in our manufacturing industries. The report concerning these imports for the full year has not been completed, but it is known that for eleven months the value of imported materials in a crude condition, for the use of manufacturers, was greater by \$62,000,000 than the value of such imports for the corresponding months of the preceding year.

Steel and Iron

As shown by official reports recently published, the United States Steel Cor-

poration's net earnings for the last quarter (\$36,499,528) were less by \$1,162,530 than those of the corresponding quarter of 1902, and the decrease for the half-year was \$2,838,000. This may be accounted for in part by increase of wages. It is known, also, that premiums were paid to some producers in 1902 for prompt delivery. The decrease appears to have no important meaning. The corporation's unfilled orders on hand July 1st were 4,666,578 tons, against 4,741,993 one year earlier. Surplus for the half year, after paying dividends, fixed charges, and all demands for sinking funds and depreciation, was \$17,037,047. *The Iron Age's* monthly report shows that the pig iron output record was broken again on July 1st, when the weekly capacity of furnaces in blast (414,636 tons) for the first time exceeded 400,000 tons. The actual output for June and for the four months ending with June was at a rate exceeding 20,000,000 tons per annum.

THE Audit Company of New York has been appointed by ex-Senator James Smith, Jr., the Receiver of the United States Shipbuilding Company, to make the examinations called for by the court. The same company was employed to examine the Asphalt Company of America, the American Bicycle Company, and other similar corporations for purposes of reorganization. It has been appointed by the Baltimore committee to report upon the earnings of the Cotton Duck companies.

....The Irving National Bank has published for distribution a handsome folder, with pictures of its new building and of Washington Irving's "Sunnyside," other appropriate illustrations and a brief history of the institution.

....Owing to the resignation of Abram M. Hyatt, Osborn W. Bright has been elected First Vice-President, and L. Carroll Root, Second Vice-President, of the New York Security and Trust Company.

....The Pittsburg Plate Glass Company has purchased control of the plate glass works at Courcelles in Belgium for \$1,000,000.

VOL. LV

NEW YORK, THURSDAY, JULY 30, 1903

No 2852

Survey of the World

Washington Topics

Recent reports from Colombia say that signs of a popular movement in favor of the canal treaty are seen in the numerous telegrams, asking for ratification, which have been sent to Congress by prominent men in all the principal cities. It is generally understood that the opponents of the treaty will demand that the sum to be paid by the United States shall be \$25,000,000, instead of \$10,000,000. Official statements published in Bogota point to the extraordinary depression of the currency. The par value of the paper in circulation is about \$656,000,000, the actual gold value of which is only a little more than one cent for each dollar, as the value of a foreign debt of \$14,027,000 in gold is said to be \$1,262,475,000 in Colombian paper notes.—As a result of the postal service investigation at Washington Charles Hedges has been removed from the office of Superintendent of City Delivery for falsifying his reports to enable him to collect a per diem allowance at times when he was not entitled to it. Hedges was the assistant of Superintendent Machen, recently indicted, and was interested with him in mining companies.—Additional charges relating to the glove contracts in which Congressman Littauer's glove factory is said to have been interested, have been published. They relate to transactions of three or four years ago, and are substantially to the effect that work was withheld from the lowest bidder and given to bidders whose business was really owned, it is alleged, by the Littauer firm. Mr. Littauer asserts that the published statements are false and that the attack

upon him is the result of a political conspiracy.—The battle ship "Kearsarge" arrived at Bar Harbor last Sunday afternoon after making a fine run across the Atlantic, 2,900 miles, in nine days and nine and one-quarter hours, at an average speed of 13 1-6 miles an hour. This test was ordered by the Navy Department and it has been highly satisfactory. In the 53 days after her departure from New York the great battle ship visited Germany, Denmark and England, and steamed 8,200 miles. During all this time there was no accident to her machinery, and upon her arrival at Bar Harbor she was in excellent condition for another run across the ocean.

Mob Violence, North and South

Another collision between a lynching mob and the defenders of a jail took place last Saturday night in Danville, Ill., the home of Congressman Joseph G. Cannon, who is to be Speaker of the House. A negro named Wilson had committed an atrocious assault upon Mrs. Burgess, the wife of a farmer living near Danville. He had begged for food, and he attacked her while she was preparing it for him. After he had been lodged in the Danville jail, where he confessed his guilt, a mob set out to lynch him. Some opposition was offered by the negroes of the town, one of whom—John D. Metcalf, who had fled from Evansville, Ind.—fired upon the lynching party, killing a merchant named Gatterman. The police succeeded in placing Metcalf in the station house. Then the mob battered down a part of the wall of that building, took Metcalf out, killed him, and burned his body to ashes. The

funeral pile was prepared in the yard of the jail, and after the body had been consumed the mob demanded the surrender of Wilson. Sheriff Whitlock refused to give him up. The mob then attacked the jail. After fair warning, the sheriff fired repeatedly upon the lynchers, who were trying to break down the door with a steel rail. A score of them were wounded, but it is said that in no case were the injuries mortal. There was a demand from the mob that the sheriff, as well as Wilson, should be lynched. He remained on guard, however, and no further attack was made. On Sunday morning four companies of militia arrived from Springfield. While the riot was in progress the police gave the sheriff no assistance. It is said that they were obeying instructions given by the Mayor.—In Indiana, a delegation of negroes called upon Governor Durbin, last week, and asked for the privilege of organizing a military company, saying that they would be glad to serve for the repression of such mob violence as had been shown at Evansville. The Governor told them that such action would be inadvisable at the present time.—John Gilbert, a negro, was lynched at Marion, Ark., last week, for killing a planter.—At Eastman, Ga., on the 23d., Sheriff Rogers, by threatening to fire upon a lynching mob, successfully defended two white prisoners, a man and a woman who were held for murdering the woman's husband, a rich planter named Tucker.—Thomas Drum, the negro who attempted to assault the daughter of Mayor Davis, in Red Bank, N. J., was tried, convicted and sentenced in three hours, on the 20th inst. Only one week had elapsed since the crime was committed. Drum had been paroled after serving fourteen years under a sentence for thirty years. The new sentence is for nineteen years, to which the sixteen remaining years of the old one are added.—At the trial of the peonage cases in Alabama, R. B. Franklin was found guilty by a jury. Judge Jones imposed a fine of \$1,000. Another planter, Fletcher Turner, as to whose guilt the jury disagreed, pleaded guilty and was punished by a fine of the same amount. An inquiry concerning peonage in Georgia has been ordered by the Legislature of that State, and the Prison Commission has

been directed by the Governor to investigate outrages reported from the convict camps.—On a plantation near Shreveport, La., a negro woman was lynched last Saturday night, because it was believed that she had murdered a planter's daughter by poison.—It is now known that a negro lynched in Dodge County, Ga., some days ago for assault upon Miss Johnson, a school teacher, was innocent. The real criminal is still at large.

Labor Questions

The case of William A. Miller, assistant foreman of the bindery in the Government Printing Office at Washington, has attracted much attention. All the employees in the bindery are members of the binders' union. Miller was expelled from the union some weeks ago, and when notice of his expulsion was given to the Public Printer, the latter removed him. Complaint having been made to the Civil Service Commission, that body on the 6th inst. requested that Miller be reassigned to duty, as the civil service rules had been violated in his removal for the reason given. The President caused an investigation to be made by Secretary Cortelyou, and on the 13th he directed that Miller be reinstated, saying in a letter to the Secretary:

"On the face of the papers presented, Miller would appear to have been removed in violation of law. There is no objection to the employees of the Government Printing Office constituting themselves into a union if they so desire; but no rules or restrictions of that union can be permitted to override the laws of the United States, which it is my sworn duty to enforce."

In a second letter he directed attention to that part of the Anthracite Coal Strike Commission's decision which forbids discrimination against any workman "on account of membership or non-membership in any labor organization," adding the following comment:

"I heartily approve of this award and judgment by the Commission appointed by me, which itself included a member of a labor union. This Commission was dealing with labor organizations working for private employers. It is, of course, mere elementary decency to require that all the Government Departments shall be handled in accordance with the principles thus clearly and fearlessly enunciated."

Miller was formally reinstated on the 24th. The union had at first intended to go on strike whenever he should return, as its rules forbid members to work with non-union men; but it decided to await the result of a pending investigation of charges formally preferred by its officers. It is asserted by them that Miller vilified his superiors, and was habitually offensive and coarse in conversation and bearing. Miller says that he was attacked and expelled because he reproved lazy workmen, objected to a restriction of work output by a union committee, sought to reduce the expenses of the bindery, and gave to two members of Congress information concerning cost of production and relating to needed improvements. The evidence now accessible appears to sustain him. But the investigation has not been completed.—It is predicted by some that several new indictments, in addition to those recently found against three walking delegates in New York for blackmail and extortion, will be based upon the testimony taken last week at the trial of Lawrence Murphy, formerly treasurer of the Stonecutters' Union, who is accused of appropriating to his own use \$12,000 of the union's funds. Counsel for the defendant seeks to prove that the money was not lawfully the property of the union, but had been unlawfully extorted from an association of employers. The testimony of certain officers of the union is regarded by many as tending to prove that large sums demanded from employers were taken and used by a small group, the members of which voted it to themselves for services to be rendered afterward.

Immigration for the Fiscal Year

More immigrants arrived in the United States during the fiscal year that ended on June 30th than in any other year of our history. The total number was 857,046, against 648,743 in 1902, and if this percentage of increase should be maintained during the present year the total for the fiscal year 1904 would exceed 1,100,000. Of those arriving during the past year, 572,726, or a little more than two-thirds, came from Austria-Hungary, Italy and Russia

(Finland included). Arrivals in 1903 and 1902, from a majority of the countries named in the official returns, are shown in the following table:

Country.	1902.	1903.	Increase.
Austria-Hungary	171,989	206,011	34,022
Belgium	2,577	3,450	873
Denmark	5,660	7,158	1,498
France	3,117	5,578	2,461
German Empire.....	28,304	40,086	11,782
Greece	8,104	14,090	5,986
Italy	178,376	230,622	52,247
Netherlands	2,284	3,998	1,714
Norway	17,484	24,461	6,977
Portugal	5,307	9,317	4,010
Roumania	7,196	9,310	2,114
Russia and Finland...	107,347	136,093	28,746
Servia and Bulgaria..	851	1,761	910
Spain	975	2,080	1,105
Sweden	30,894	46,028	15,134
Switzerland	2,344	3,983	1,639
Turkey in Europe.....	187	1,529	1,342
England	13,575	26,219	12,644
Ireland	29,138	35,310	6,172
Scotland	2,560	6,143	3,583
Wales	763	1,275	512
China	1,649	2,209	560
Japan	14,270	19,968	5,698
Turkey in Asia.....	6,223	7,118	895
Australia and New Zealand	384	1,150	766
British North America.	636	1,058	422
South America.....	337	589	252
West Indies.....	4,711	8,170	3,459

The immigration movement has been governed largely by our industrial and commercial condition. This is shown by the record of the last quarter of a century:

Year.	Number.	Year.	Number.
1903.....	857,046	1890.....	455,302
1902.....	648,743	1889.....	444,427
1901.....	487,918	1888.....	546,889
1900.....	448,572	1887.....	490,109
1899.....	311,715	1886.....	334,203
1898.....	229,209	1885.....	395,346
1897.....	230,832	1884.....	518,592
1896.....	343,267	1883.....	603,322
1895.....	279,948	1882.....	788,992
1894.....	314,467	1881.....	669,431
1893.....	502,913	1880.....	457,257
1892.....	623,084	1879.....	177,826
1891.....	560,319	1878.....	138,469

Some of the changes that have taken place in this movement may be seen by comparing last year's record with that of 1882, which, up to last year, showed the largest total. In 1882 the numbers for several of the countries named were as follows: Germany, 250,630 (now 40,080); Ireland, 76,432 (now 35,310); England, 82,394 (26,219); Austria-Hungary, 29,150 (206,011); Italy, 32,150 (230,622); Russia, 21,500 (136,093).

993): Sweden, 64,607 (46,028); Scotland, 18,937 (6,143). During the past year 8,769 arriving immigrants were debarred—5,812 because they were paupers or liable to become public charges, 1,773 on account of disease, and 1,086 because they were laborers imported under contract. A majority of the Japanese immigrants were received in Hawaii.—On the 19th inst., Teng Hwee Lee, a graduate of Yale in 1899, arrived at San Francisco and was not permitted to land. He had been teaching in the Straits Settlement and had returned to this country to take a graduate course at one of our universities. Unfortunately he did not have with him the certificate which entitled him to admission, and his Yale diploma was not sufficient.

The Philippine Islands

Gen. Leonard Wood has arrived at Manila and will proceed to Zamboanga, where he will organize the government of the Moro province.—In Albay last week a band of 250 rebels was attacked by the scouts and constabulary, who killed fifteen of them.—The Rev. Thomas A. Hendrick, of Rochester, one of the four American Catholic bishops recently appointed, called upon the President on the 24th to discuss questions relating to his Church in the islands. It would be the aim of the bishops, he asserted, to encourage the education of native priests. Old seminaries will receive additional endowments, new ones will be established, and Filipino priests will be enabled to complete their education at the Catholic University in Washington and other similar institutions in this country. Thus they will gain a knowledge of American methods and ideals.—As evidence of the capacity of Filipinos for the more delicate kinds of labor, the experience of the Manila *Cablenews*, with its linotype machines, may be cited. Without any instruction in typesetting or in the use of the rather intricate machines, one Filipino youth of twenty-one was able in four months to set up six or seven columns in an evening. Another Filipino, two years younger, can set seven columns and a half (about three to four columns of an ordinary American newspaper) in eight hours. This work is done, of course, in

English, a language unfamiliar to them. The *Cablenews* also testifies that these two and the other apprentices employed on the machines have missed no day's work because of fiestas, not even on Christmas Eve.—The Manila health board has long been planning to get rid of the squalid huts and crowded nipa dwellings to be found in some parts of the city. That they were a serious menace to public health was known long before the cholera broke out last year in the fishermen's section. If the municipality had had the funds, bamboo and nipa tenements of a sanitary pattern and arrangement and in good, dry localities would before this have been built on a big scale. The experience of Naples in dealing with its great proportion of poor, housed in disease-breeding hovels, has been held in mind in Manila. The beginning of a municipal tenement system has been made, with the completion of a structure in the Sampaloc district of the city, which will accommodate one hundred families, and has two stories, the first floor being at a sufficient height from the ground. The cost was about \$6,000 Mexican, and the structure when filled will yield an income of \$1,200 Mexican per annum.

Cuba and Porto Rico

Three Commissioners, authorized to inquire in the United States and Europe as to the negotiation of the proposed Cuban loan of \$35,000,000, will soon be appointed. The question having been raised unofficially concerning the bearing of the Platt Amendment upon this attempt to borrow \$35,000,000, President Palma permits the publication of his opinion that supervision of the undertaking by the United States would be considered odious by the people of Cuba. His Government, he adds, has made ample provision for the proposed loan in an increase of the public revenues. There is, moreover, a surplus of more than \$3,000,000 in the insular treasury. Still, it is natural and proper, he thinks, that our Government should satisfy itself that the requirements of the Platt Amendment have been complied with.—In Porto Rico, the agents of a company which claims to have large concessions for establishing colo-

nies on the coast of Yucatan are inducing emigration to that coast from Mayaguez and other neighboring places. Natives of the island are demonstrating their fitness for positions in the public service. Since the application, in March last, of the civil service rules to Federal positions on the island, 76 residents, many of them natives, have received appointments which were earned by open competitive examinations. A considerable number of the places so earned are in the Departments at Washington.—It is understood that Governor Willim H. Hunt has given notice of his intention to resign. He was appointed in December, 1901, for a term of four years.

The Vatican Immediately on the death of the Pope, Cardinal Oreglia assumed his duties as Camerlengo, sealing up the papal effects, reading the will and calling together the Cardinals to make arrangements for the conclave. He omitted the traditional ceremony of tapping three times the forehead of the dead pontiff with a silver hammer, and simply called him by his name, "Joachim," three times before making the official announcement of the death. At the autopsy the internal organs were, according to the ancient custom, placed in an urn and carried at midnight to the Church of Saints Vincent and Anastasius, which is the parish church of the Quirinal. The embalmed body of the Pope was taken in the evening by a procession of Cardinals in violet robes carrying torches, Noble Guards in their peculiar uniform, and the Sistine choir, down the great staircase and into St. Peter's by the Charlemagne Portico, and placed in the chapel of the Holy Sacrament, where it was seen by some eighty thousand people on the following days. Fifteen hundred Italian soldiers in uniform, caps and side arms acted as guards, both in the piazza and the church. This is the first time the Italian soldiers have entered the papal territory since the loss of the temporal power, and it is regarded as significant of a better feeling between the Vatican and the Quirinal. At sundown on Saturday the body of Leo XIII was laid in a tempo-

rary tomb in the basilica of St. Peter's, Monsignor Bartolini giving in Latin the *oratio brevis*, and a history of the pontificate, together with coins and medals, being placed with the body. The final entombment will be in the basilica of St. John Lateran. The will of the Pope, which is in his own handwriting, leaves all his large amount of personal property to his successor for the benefit of the Church, except for a few family gifts and some alms.—As a illustration of the quickness of American methods of handling news items it is interesting to note that the news of the Pope's death reached Paris from New York before it was received from Rome.

The Conclave Preparations for the immurement of the College of Cardinals in the Vatican have been nearly completed, and the conclave will convene on August 1st, remaining in session isolated from the world until some one of their number is chosen Pope by two-thirds majority. The Camerlingo, Cardinal Oreglia, who has charge of the arrangements, is the only member of the College who has taken part in a conclave since all the other Cardinals were appointed during the long reign of Leo XIII. In the place of Monsignor Volpini, who was appointed to be Secretary of the Consistory but died before the Pope, selection has been made of Monsignor Merry del Val, who was born in London, and is a son of a former Secretary of the Spanish Legation at the Court of St. James. If, according to the old custom, the newly elected Pope, when he assumes the tiara, places on the head of the Secretary his Cardinal's hat, he will be the youngest of the College, as he is only thirty-eight years old. All the Cardinals will probably be present at the conclave except Cardinal Moran, Archbishop of Sydney, New South Wales, who did not start from Australia in time, and Cardinal Celesia, Archbishop of Palermo, who is ill.

International Arbitration A group of members of the French Chamber of Deputies visiting London last week for the purpose of promoting the principle of international arbitra-

tion were entertained at dinner at the House of Commons by a hundred and fifty members of the House. This delegation is a non-partisan organization formed a year and a half ago, and already sufficient in importance and numbers to exercise a real influence toward the promotion of the peace of nations. Baron d'Estournelles, the leader of the delegation, advocated the extension of the principles of arbitration to the colonial policies of the two countries, and sketched a plan to lead to the diminution of armaments. Mr. Balfour, the Prime Minister, in reply, urged his auditors not to allow this unique opportunity to remain fruitless, but to see that the idea should be extended to the practical business of life and to international relations in their broadest sense. He said it was the deliberate intention of these two countries to place on a permanent basis some organization to prevent the causes of petty friction which tended to lead to international difficulties, and that he could assure Baron d'Estournelles that the Government was determined, if it could, to arrive at some practical method to prevent small diseases from developing into fatal maladies. The Colonial Secretary, Mr. Chamberlain, said that he was one of those who believed in the *entente cordiale*, which depended less on treaties and conventions than on the mutual sympathy of two peoples; that sympathy existed and it only required occasions like this to call it forth. The next day the French Arbitration group were received by the Lord Mayor. It is thought that the practical outcome may be the formation of a Franco-British arbitration agreement similar to that of The Hague, but more extensive in its scope.

The King in Ireland King Edward and Queen Alexandra have been everywhere received in Ireland, not only with the customary official rejoicings, but with what appears to be genuine enthusiasm and good will on the part of the whole people. The irreconcilable Maude Gonne, now Mrs. McBride, hung a black flag from her window, which was pulled down by the

police, but as she hung up another, stating it was in memory of the Pope, and with the aid of women friends defended it with pokers and boiling water, it was not again molested. On account of the death of the Pope many of the festivities have been countermanded, and the King and Queen have appeared in partial mourning. In their visit to Maynooth College on Friday, which was the first time an English sovereign has ever entered its walls, the royal party were received by the Archbishops of Dublin, Cashel and Tuam and twenty bishops. In reply to the address of welcome the King said:

"I value highly your true appreciation of my feeling toward my Irish people, who have contributed so much to the strength and honor of my empire, and who bring such admirable gifts of mind and heart to the enrichment of the national life. It was with saddened feelings that I listened to your reference to the venerable Pontiff who has just passed away, leaving a memory that will long be cherished far beyond the bounds of the church of which he was the exalted head. I shall ever retain a pathetic recollection of my interview with him, and the kindly interest he showed in the welfare of my people and my empire."

Wednesday afternoon the King visited Trinity College and spoke of his pride that his name was numbered on the rolls of the college, which boasted of Swift, Berkeley, Burke and Grattan. On Thursday he presented a set of colors to the Cadets of the Royal Hibernian Military School and reviewed 1,500 troops in Phoenix Park. Friday morning was spent visiting the public institutions of Dublin and especially the model tenements being built by Lord Iveagh (Cecil Guinness). As it is thought that the King has always favored a greater degree of home-rule than has been accorded to Ireland, and has done much to further the Irish Land bill, his visit is very opportune.—On the 21st the Land bill passed the House of Commons on its third reading with the surprising vote of 317 to 20. John Redmond, the Irish leader, said that while the bill was defective in some features, it would, if worked in a reasonable and moderate spirit, bring to Ireland the blessings of peace and prosperity. Premier Balfour in moving the third reading said the bill

was a tentative step toward the removal of the present Irish land system, which was the worst in the world, and that he did not doubt that after the agrarian settlement the political controversies would remain; but the Irishmen who were demanding a great constitutional change would not be embittered by a sense of social wrong.

The Congo

The attacks which have recently been made by both missionaries and traders on the Belgian management of the Congo, on the grounds that it was cruel to the natives and restrictive of religious and commercial freedom, have called out some official and unofficial denials. The Premier, Count de Smet de Naeyer, in advocating a colonial policy for an industrial country like Belgium, said:

"All the income of the *domaine privé* and of the shares possessed by the Congo State are the property of the Congo Budget, as shown by it. As regards the Crown domain, it is not in the hands of the King, but is administered by three directors for public works and scientific researches, and is based on principles similar to those which govern English institutions. The King personally does not get a penny from the Congo."

In regard to the charge of requiring forced labor from the natives, it is urged that as the imports are insignificant some way of raising the funds for administration and improvement is necessary, and that a million dollars is paid to the natives for the labor, amounting to thirty hours per month, required of them for the cultivation and replanting of rubber trees. Since these wages result in raising the standard of life of the natives, they, little by little, begin to labor voluntarily. If the natives were treated cruelly they would emigrate in a body instead of working. It is only through the persistent efforts of King Leopold in the face of ridicule and denunciation for years, and through large expenditure on his part, that the Congo has been opened to trade, and now that the territory is regarded as valuable attacks are being made by England on his administration with a view of securing control in the territory. The Congo is open to all legiti-

mate trade and foreign enterprise, and, if England has seen her trade dwindle, it is because she has failed to profit by these opportunities. The Congo has suffered much from missionaries, above all from American missionaries, such as the Rev. Mr. Morrison, who is offended because he was refused certain privileges demanded by him.—The British charges of interference with trade in the Congo Free State are confirmed by an official letter from Duke John Albrecht of Mecklenburg, president of the German Colonial Society, to the Imperial German Chancellor, in which he states that Germany is debarred from all trade with Central Africa, and that the Congo State, instead of improving the conditions of the natives, employs them for its own benefit:

"The Congo imports in 1901 amounted to 23,000,000f. and the exports to 50,000,000f. The difference between the two figures represents," says the Duke, "the profit made by the Congo State, thanks to the heavy taxes and the grabbing of all produce for its own profit at the expense of the natives. Besides that, the Congo Free State has prohibited all German trade on the borders of Lake Tanganika. No foreign trader or caravan is allowed to enter its territory."

Bulgarian Disturbances

The massing of a considerable body of Turkish troops on the frontier to suppress the continually threatening uprising in Macedonia caused great excitement in Bulgaria, but the danger of war was for the time allayed by the intervention of the Powers to induce Turkey to grant some concessions and by the urgent endeavors of the Bulgarian Exarch to pacify the Bulgarians Macedonians. It was reported from Sofia, however, that the Bashi-Bazouks, in searching for arms among the Bulgarian villages of Kirkilisse, had maltreated the people in the cruelest manner, and that in the village of Yenidje thirty-four persons were killed. The sudden departure of Prince Ferdinand and his children for Coburg at this crisis gave rise to rumors that a revolution has broken out in Bulgaria and that he was in danger of sharing the fate of the late King of Servia, but his journey was semi-officially explained from Vienna as his

usual custom of visiting his father's grave on the anniversary of his death, and, again later and somewhat inconsistently, that his desire was merely for a shooting expedition on his estates. There are many sensational reports afloat; one of them to the effect that Prince Ferdinand of Bulgaria is to be deposed and Peter Karageorgevitch made King of both Servia and Bulgaria. It is also said that a Russian specialist has reported to the Czar that Prince George, the eldest son of Peter I of Servia, is weak-minded and a degenerate. Prince George is fifteen years old, and has been for some time in the care of the Dowager Czarina. It has been thought that the King might abdicate in his favor.

Manchuria

Whatever may have been the policy decided upon by the Russian officials at their recent conference held at Port Arthur, there is no evidence of any intention on the part of Russia to evacuate Manchuria. On the contrary, the importation of large bodies of troops, field guns and ammunition, the shipment of foodstuffs and coal to strategic points and great activity in drilling, maneuvering and gun practice on the Russian fleet indicate that the occupation of Manchuria is to be made secure enough to resist Japan, even with England as an ally. Two powerful forts are to be built at Dalny, and 12,000 to 15,000 troops will be stationed there. The coast and railway are to be fortified from Port Arthur to a point two stations above Dalny. There are some 30,000 troops now between Niu-Chwang and Port Arthur. At Niu-Chwang a large building is to be erected on the public square in the center of the foreign consulate district to hold the Russian administrative departments, including telegraphs and telephones. Russian immigrants are being brought into Manchuria in immense numbers, and, since these men have all had military training, they could be converted into an army at any time.—Prince Ching, head of the Board of Foreign Affairs at Peking, stated to Minister Conger that

he had received no recommendations from Russia advising the opening of the Manchurian ports, Mukden and Ta-Tung-Kao, and that China cannot open these ports so long as they are occupied by the Russian troops. The other legations at Peking have, however, been notified that they will be opened. It was also stated by Mr. Lesar, the Russian Minister, that the Port Arthur conference had decided to invite foreigners to assist in the construction of the branch lines of the Manchurian Railway, owing to lack of capital.

The Yalu River

The center of disturbance in the East is the Yalu River at the boundary of Korea and Manchuria. A concession was obtained from the Korean government giving the Russians the right to fell timber along the Yalu River. This was construed by the Russian Government as carrying with it the right to construct railways and telegraphs along the river. On attempting to do this, however, the telegraph poles were removed by the Korean officials. M. Pavloff, the Russian Minister to Korea, has instructed the company to replace them and has announced that the cost of the property destroyed by the Korean officials will be deducted from the royalty payable to Korea by the lumber company. Wiju, the Korean port at the mouth of the Yalu, of which the opening was demanded by Japan and England, will remain closed owing to the opposition of the Russian Government, which is endeavoring to establish sole control of the river. There is already a Russian settlement on the Korean side of the Yalu River, and permanent buildings are being erected there. The Manchurian side is occupied by Russian troops, few in number but easily reinforced. Ta-Tung-Kao, the port which we are endeavoring to have opened, is a town of about 5,000 inhabitants and very inconvenient, since ships cannot approach within four miles and the passage to the shore is shallow, narrow and dry at low water. The request of the United States for a better harbor in the vicinity was refused by the Russian Government.

Nocturna

INGEMISCENTIS ANAMAE MEDITATIO

By Leo XIII

[The following poem was dictated by the Pope when he supposed he was on his deathbed. It was recently issued in Rome for the first time, and we have received an early copy of it from our Rome correspondent. The translation that follows is by Professor Harry Thurston Peck.—EDITOR.]

*Fatalis ruit hora, Leo; iam tempus abire est,
Pro meritisque viam carpere perpetuam.*

*Quae te sors maneat? caelum sperare iubebant,
Largus contulerat quae tibi dona Deus.*

*At summae claves, immenso pondere munus
Tot tibi gestum annos, haec meditare gemens:*

*Qui namque in populis excelso praestat honore,
Hei misero, poenas acrius inde luet.*

*Haec inter trepido dulcis succurrit imago,
Dulcior atque animo vox sonat alloquii:*

*Quid te tanta premit formido? aevique peracti
Quid seriem repetens, tristia corde foves?*

*Christus adest miserans: humili veniamque roganti
Erratum, ah fidas! eluet omne tibi.*

At Nightfall

THE MEDITATION OF A TROUBLED SPIRIT

*Leo, the destined hour! Now must thou hence
And, as thy merits, take the endless way.*

*What lot awaits thee? Heavenly joy, thy gifts
Which God had freely given, bade thee hope—*

*But the great Keys! A trust of mighty weight
And borne so long—thou groanest at the thought;*

*For he who leads in honor all the rest
Must, if he fail, the keener suffering bear.*

*Amid thy fears, there comes a gentle face,
A gentler voice speaks comfort to the heart:*

*"Why does fear shake thee? Why, on gazing back
O'er thy long past, should sadness stir thy soul?"*

*"The pitying Christ is here: He gives his grace
To those that seek. Have faith—He beareth all."*

A Great Object-Lesson

By Rebecca Harding Davis

THE great Controller of the world does not often gratify the dramatic sense of his creatures with a finer scene than that of the death of the Pope the other day.

A man who was one of the foremost rulers of the world, who had compelled the respect of all nations by his wisdom and kindness, a man whom millions of men regarded as the Vicegerent of God on earth, after nearly a century of busy work fought with death hour after hour for weeks—to stay—to keep to his work. He was driven back step by step, and went at last into the outer darkness, calm and unafraid leaving a blessing behind him on us all. No man, be he Pagan, Papist or Protestant, could be blind to the dramatic grandeur of that exit. The Church of which he was the earthly head missed a point when she did not devise a way in which the world could have saluted the departing shade.

A few years ago, as we all remember, when a great railway king died, every train on the system which he controlled stopped wherever it might be during the hour of his funeral. Later, when Mr. McKinley died, the whole country stood still while his body was laid to rest. Traffic stopped from Maine to California; even the most crowded streets of New York were silent and motionless for that half-hour. Men uncovered and women breathed a prayer.

I wonder that the Catholic Church, which is so ready to use every means to influence popular opinion, and so skillful in using them, did not honor her great head in some such way. Who could object? In older countries they take time to respect every dead man. The nobleman in his liveried coach draws to one side upon the road to make room for the unknown pauper's hearse, and every passer-by stops and uncovers as he goes upon his last journey.

There is no man in America who would not have been helped by a moment's pause and silence as Pope Leo was laid in his grave, if it were only to

give him time to define to himself his opposition to the great priest and to the doctrines which he taught.

What I am trying to say is that we all should be helped by object-lessons and pauses in our incessant work. Many dark questions would grow clearer to us through them.

But we modern Americans have become so commercial and practical that we have a contempt for such romantic doings. Books and newspapers, we hold, are the only fountains of knowledge necessary for sane men and women. When we go to older countries we are apt to look with pitying contempt on the pictured Madonnas and the little old shrines of the Infant Christ on the street corners and in the back of the shops with lamps burning before them.

It does not occur to us that the picture and the carved crucifix, with all the cheap symbolism of the early churches, were the only methods they had of teaching the truths of the Christian religion to the people. There were no printed books, and how many could have read them if there had been?

Even at this late day, too, the American, with all of his keen mother wit and hoards of facts and of knowledges from his babyhood packed daily into his brain, done up in separate packages, labeled and ready for instant use, is still oddly susceptible to the teaching of object-lessons.

The Liberty Bell, in its journeys through the country, does more to make loyal citizens of our people than all the books that ever were written. It is one thing to read on a cold printed page that you are free to earn your living as you please, to make your own laws, and to worship God as you choose, and another to actually see and touch the old bell that first told this glad tidings to the land and proclaimed Liberty to all the inhabitants thereof. Even if Philadelphia is the birthplace of the nation and owns the bell, she should not grumble when it goes out on its triumphant journeys, but

thank God for the lesson it teaches—that Americans are still individual freemen, not to be ruled by bosses or walking delegates any more than by kings or czars.

Every flag, too, fluttering on the top of our schoolhouses is a more powerful lesson to the boys inside than any in their text-books, and the custom of rising when the first bars of the "Star Spangled Banner" are played—young and old, children and tottering age together—is another which makes our hearts burn with love and pride for our country. What book or newspaper does that?

God himself, it seems sometimes, teaches us by object-lessons.

We are all busy with work or play, comfortable and complacent together, congratulating each other daily that what with our sciences and arts and mother wits we have conquered every difficulty in life. We have exposed and tamed all the secrets of Nature; we have found the elements, they are our slaves; the lightnings answer our call and carry the messages of the smallest child. And some day, in the very midst of our boasting and complacency, old Nature rises at His bidding like a huge beast in the forest and shakes herself, and a great blizzard or a tidal wave sweeps over cities and villages or Mt. Pelée vomits her fire. Nothing remains afterward but death. Where is our skill or science then?

No sermon of prophet or saint ever told us as plainly as these stupendous catastrophes of Nature that God, not man, rules, and that there is a future life. What does the death in one day of two thousand human beings in India or China matter to their Maker who knows he has but removed them to another place to go on living?

Of course, there are doubting Thomases, who gibe at all these things. This kind of man learns nothing from any object-lesson, even if the Almighty teaches it. You will not find him putting flowers on any grave, or getting on his legs when the band plays the "Star Spangled Banner." He went to see "Everyman" last winter. His neighbors sat pale and silent listening to the tap of the drum of death and thinking:

"I, too——! Before long I shall hear that call, and how can I answer it?"

But he was giggling at the color of the angels' wings or criticising the embroidery of the costumes.

Did he approve when the country stood silent and motionless while the murdered President was laid in his grave?

Certainly not. "Business suffered," he said. "His own mail was a half-hour late. Americans have no time for sentimental high jinks. Besides——" and then he whispered a reminder that there were many who considered McKinley to be only a shrewd political trickster. The other day, too, when the Pope died he was eager to assure us that he was only an Italian priest elevated to the Pontificate by chicanery, a keen politician and a poor poet.

No doubt to many of the readers of THE INDEPENDENT, honest, well meaning folk all of them, the pathos and significance of the deaths of these two men were blotted out by their conviction of the iniquities of the Republican party and the Roman Church. They insist that these charges were true to the letter. But is not this the letter that killeth? Surely it is more wholesome and helpful for us, whatever our church or party may be, to find honesty in McKinley and piety in Leo than to jeer at both as frauds.

This kind of wideawake Thomas sees a drunken woman, her baby in her arms, staggering on the street. She is nothing to him but a fit candidate for the Black Maria. The wiser man sees in her look at the child all the possibility, the hope that lies in the motherhood of the world. But it is Thomas who is popularly rated as a shrewd fellow. You can't fool him! He wants the facts, he is not to be blinded by cheap sentiment.

He can show us the ugly skeleton below the flesh and blood of all men and women. These working folk, he tells us, are all anarchists, ready to empty our pockets or cut our throats; the Four Hundred are all idiots or criminals; all clergymen are hypocrites; Russians are brutes and Jews cheats; lynchers and lynched are all beasts together.

There is a certain truth in what he sees; but is there no truer truth beneath?

It is your man with enthusiasm, with a dramatic sense, who throws himself

into other human beings, who finds in each the flame which God put into him. Your fact-abiding man trampled the mud of this world under his feet and kicked the stones aside and breathed the air for ages, and found in them nothing

but wind and stones and mud. But the enthusiast came along and found in them all the electric fire that propels the world. It is he who will see the real meaning of Leo's death and of all God's other object-lessons.

MARION, MASS.

An Indian Boy's Story

By Ah-nen-la-de-ni

[Ah-nen-la-de-ni, whose American name is Daniel La France, told his own tale in neat typewritten form, and has been aided only to the extent of some rewriting and rearrangement.—EDITOR.]

I WAS born in Gouverneur Village, N. Y., in April, 1879, during one of the periodical wanderings of my family, and my first recollection is concerning a house in Toronto, Canada, in which I was living with my father and mother, brother and grandmother. I could not have been much more than three years old at the time.

My father was a pure-blooded Indian of the Mohawk tribe of the Six Nations, and our home was in the St. Regis reservation in Franklin County, N. Y., but we were frequently away from that place because my father was an Indian medicine man, who made frequent journeys, taking his family with him and selling his pills and physicks in various towns along the border line between Canada and the United States.

This house in Toronto was winter quarters for us. In the summer time we lived in a tent. We had the upper part of the house, while some gypsies lived in the lower part.

All sorts of people came to consult the "Indian doctor," and the gypsies sent them upstairs to us, and mother received

them, and then retired into another room with my brother and myself. She did not know anything about my father's medicines, and seemed to hate to touch them. When my father was out mother was frequently asked to sell the medicines, but she would not, telling the patients that they must wait until the doctor came home. She was not pure-blooded Indian, her father being a French Canadian, while her mother, my grandmother, was a pure-blooded Indian, who lived with us.

What made it all the more strange that mother would have nothing to do with the medicines was the fact that grandmother was, herself, a doctor of a different sort than my father. Her remedies were probably the same but in cruder form. I could have

learned much if I had paid attention to her, because as I grew older she took me about in the woods when she went there to gather herbs, and she told me what roots and leaves to collect, and how to dry and prepare them and how to make the extracts and what sicknesses they were good for. But I was soon tired of such matters, and would stray off by myself

AH-NEN-LA-DE-NI

picking the berries—raspberry and blackberry, strawberry and blueberry—in their seasons, and hunting the birds and little animals with my bow and arrows. So I learned very little from all this lore.

My father was rather a striking figure. His hair was long and black, and he wore a long Prince Albert coat while in the winter quarters, and Indian costume, fringed and beaded, while in the tent. His medicines were put up in pill boxes and labeled bottles, and were the results of knowledge that had been handed down through many generations in our tribe.

My brother and I also wore long hair, and were strange enough in appearance to attract attention from the white people about us, but mother kept us away from them as much as possible.

My father was not only a doctor, but also a trapper, fisherman, farmer and basket maker.

The reservation in Franklin County is a very beautiful place, fronting on the main St. Lawrence River. Tributaries of the St. Lawrence wander through it, and its woods still preserve their wild beauty. On this reservation we had our permanent home in a log house surrounded by land, on which we planted corn, potatoes and such other vegetables as suited our fancies. The house was more than fifty years old.

The woods provided my father and grandmother with their herbs and roots, and they gathered there the materials for basket making. There were also as late as 1880 some beavers, muskrats and minks to be trapped, and pickerel, salmon and white perch to be caught in the streams. These last sources of revenue for the Indians no longer exist; the beavers, minks and muskrats are extinct, while the mills of the ever encroaching white man have filled the streams with sawdust and banished the fish.

We were generally on the reservation in early spring, planting, fishing, basket making, gathering herbs and making medicine, and then in the fall, when our little crop was brought in, we would depart on our tour of the white man's towns and cities, camping in a tent on the outskirts of some place, selling our wares, which included bead work that mother and grandmother were clever at

making, and moving on as the fancy took us until cold weather came, when my father would generally build a little log house in some wood, plastering the chinks with moss and clay, and there we would abide, warm amid ice and snow, till it was time to go to the reservation again.

One might imagine that with such a great variety of occupations we would soon become rich—especially as we raised much of our own food and seldom had any rent to pay—but this was not the case. I do not know how much my father charged for his treatment of sick people, but his prices were probably moderate, and as to our trade in baskets, furs and bead work, we were not any better business people than Indians generally.

Nevertheless, it was a happy life that we led, and lack of money troubled us little. We were healthy and our wants were few.

Father did not always take his family with him on his expeditions, and as I grew older I passed a good deal of time on the reservation. Here, tho the people farmed and dressed somewhat after the fashion of the white man, they still kept up their ancient tribal ceremonies, laws and customs, and preserved their language. The general government was in the hands of twelve chiefs, elected for life on account of supposed merit and ability.

There were four Indian day schools on the reservation, all taught by young white women. I sometimes went to one of these, but learned practically nothing. The teachers did not understand our language, and we knew nothing of theirs so much progress was not possible.

Our lessons consisted of learning to repeat all the English words in the books that were given us. Thus, after a time, some of us, myself included, became able to pronounce all the words in the Fifth and Sixth readers, and took great pride in the exercise. But we did not know what any of the words meant.

Our arithmetic stopped at simple numeration, and the only other exercise we had was in writing, which, with us, resolved itself into a contest of speed without regard to the form of letters.

The Indian parents were disgusted with the schools, and did not urge their

children to attend, and when the boys and girls did go of their own free will it was more for sociability and curiosity than from a desire to learn. Many of the boys and girls were so large that the teachers could not preserve discipline, and we spent much of our time in the school in drawing pictures of each other and the teacher, and in exchanging in our own language such remarks as led to a great deal of fighting when we regained the open air. Often boys went home with their clothing torn off them in these fights.

Under the circumstances, it is not strange that the attendance at these schools was poor and irregular, and that on many days the teachers sat alone in the schoolhouses because there were no scholars. Since that time a great change has taken place, and there are now good schools on the reservation.

I was an official of one of the schools, to the extent that I chopped wood for it, but I did not often attend its sessions, and when I was thirteen years of age, and had been nominally a pupil of the school for six years, I was still so ignorant of English that I only knew one sentence, which was common property among us alleged pupils:

"Please, ma'am, can I go out?" pronounced: "Peezumgannigowout!"

When I was thirteen a great change occurred, for the honey-tongued agent of a new Government contract Indian school appeared on the reservation, drumming up boys and girls for his institution. He made a great impression by going from house to house and describing, through an interpreter, all the glories and luxuries of the new place, the good food and teaching, the fine uniforms, the playground and its sports and toys.

All that a wild Indian boy had to do, according to the agent, was to attend this school for a year or two, and he was sure to emerge therefrom with all the knowledge and skill of the white man.

My father was away from the reservation at the time of the agent's arrival, but mother and grandmother heard him with growing wonder and interest, as I did myself, and we all finally decided that I ought to go to this wonderful school and become a great man—perhaps at last

a chief of our tribe. Mother said that it was good for Indians to be educated, as white men were "so tricky with papers."

I had, up to this time, been leading a very happy life, helping with the planting, trapping, fishing, basket making and playing all the games of my tribe—which is famous at lacrosse—but the desire to travel and see new things and the hope of finding an easy way to much knowledge in the wonderful school outweighed my regard for my home and its joys, and so I was one of the twelve boys who in 1892 left our reservation to go to the Government contract school for Indians, situated in a large Pennsylvania city and known as the ——— Institute.

Till I arrived at the school I had never heard that there were any other Indians in the country other than those of our reservation, and I did not know that our tribe was called Mohawk. My people called themselves "Ga-nien-ge-ha-ga," meaning "People of the Beacon Stone," and Indians generally they termed "On-give-hon-we," meaning "Real-men" or "Primitive People."

My surprise, therefore, was great when I found myself surrounded in the school yard by strange Indian boys belonging to tribes of which I had never heard, and when it was said that my people were only the "civilized Mohawks," I at first thought that "Mohawk" was a nickname and fought any boy who called me by it.

I had left home for the school with a great deal of hope, having said to my mother: "Do not worry. I shall soon return to you a better boy and with a good education!" Little did I dream that that was the last time I would ever see her kind face. She died two years later, and I was not allowed to go to her funeral.

The journey to Philadelphia had been very enjoyable and interesting. It was my first ride on the "great steel horse," as the Indians called the railway train, but my frame of mind changed as soon as my new home was reached.

The first thing that happened to me and to all other freshly caught young redskins when we arrived at the institution was a bath of a particularly disconcerting sort. We were used to baths of the swimming variety, for on the reser-

vation we boys spent a good deal of our time in the water, but this first bath at the institution was different. For one thing, it was accompanied by plenty of soap, and for another thing, it was preceded by a haircut that is better described as a crop.

The little newcomer, thus cropped and delivered over to the untender mercies of larger Indian boys of tribes different from his own, who laughingly attacked his bare skin with very hot water and very hard scrubbing brushes, was likely to emerge from the encounter with a clean skin but perturbed mind. When, in addition, he was prevented from expressing his feelings in the only language he knew, what wonder if some rules of the school were broken.

After the astonishing bath the newcomer was freshly clothed from head to foot, while the raiment in which he came from the reservation was burned or buried. Thereafter he was released by the torturers, and could be seen sidling about the corridors like a lonely crab, silent, sulky, immaculately clean and most disconsolate.

After my bath and reclothing and after having had my name taken down in the records I was assigned to a dormitory, and began my regular school life, much to my dissatisfaction. The recording of my name was accompanied by a change which, though it might seem trifling to the teachers, was very important to me. My name among my own people was "Ah-nen-la-de-ni," which in English means "Turning crowd" or "Turns the crowd," but my family had had the name "La France" bestowed on them by the French some generations before my birth, and at the institution my Indian name was discarded, and I was informed that I was henceforth to be known as Daniel La France.

It made me feel as if I had lost myself. I had been proud of myself and my possibilities as "Turns the crowd," for in spite of their civilized surroundings the Indians of our reservation in my time still looked back to the old warlike days when the Mohawks were great people, but Daniel La France was to me a stranger and a nobody with no possibilities. It seemed as if my prospect of a

chiefship had vanished. I was very homesick for a long time.

The dormitory to which I was assigned had twenty beds in it, and was under a captain, who was one of the advanced scholars. It was his duty to teach and enforce the rules of the place in this room, and to report to the white authorities all breaches of discipline.

Out in the school yard there was the same sort of supervision. Whether at work or play, we were constantly watched, and there were those in authority over us. This displeased us Mohawks, who were warriors at fourteen years of age.

After the almost complete freedom of reservation life the cramped quarters and the dull routine of the school were maddening to all us strangers. There were endless rules for us to study and abide by, and hardest of all was the rule against speaking to each other in our own language. We must speak English or remain silent, and those who knew no English were forced to be dumb or else break the rules in secret. This last we did quite frequently, and were punished, when detected, by being made to stand in the "public hall" for a long time or to march about the yard while the other boys were at play.

There were about 115 boys at this school, and three miles from us was a similar Government school for Indian girls, which had nearly as many inmates.

The system when I first went to this school contemplated every Indian boy learning a trade as well as getting a grammar school education. Accordingly we went to school in the morning and to work in the afternoon, or the other way about.

There were shoemakers, blacksmiths, tinsmiths, farmers, printers, all sorts of mechanics among us. I was set to learn the tailoring trade, and stuck at it for two and a half years, making such progress that I was about to be taught cutting when I began to cough, and it was said that outdoor work would be better for me. Accordingly I went, during the vacation of 1895, up into Bucks County, Pa., and worked on a farm with benefit to my health, tho I was not a very successful farmer—the methods of the peo-

ple who employed me were quite different from those of our reservation.

Tho I was homesick soon after coming to the Institute I afterward recovered so completely that I did not care to go back to the reservation at vacation time, tho at first I was offered the opportunity. I spent my vacations working for Quaker farmers. All the money I earned at this and other occupations was turned in to the Institute bank credited to my account, and I drew from thence money for my expenses and for special occasions like Christmas and the Fourth of July.

When I returned from Bucks County in 1895 I found that some of the boys of my class were attending the public school outside the institution, and on application I was allowed to join them, and finally graduated there from the grammar department, tho held back by the fact that I was spending half my time in some workshop. I never went back to tailoring, except to finish a few suits that were left when the Institute shop closed, but I worked for a time at printing and afterward at making cooking apparatuses.

After I had finished with the grammar school I got a situation in the office of a lawyer while still residing in the institution. I also took a course of stenography and typewriting at the Philadelphia Young Men's Christian Association. So practically I was only a boarder at the Institute during the latter part of my eight years' stay there.

Nevertheless, I was valuable to the authorities there for certain purposes, and when I wanted to leave and go to Carlisle school, which I had heard was very good, I could not obtain permission.

This Institute, as I have said, was a contract Government school for teaching Indians. The great exertions made by the agent, who visited our reservation in the first place, were caused by the fact that a certain number of Indian children had to be obtained before the school could be opened. I do not think that the Indian parents signed any papers, but we boys and girls were supposed to remain at the school for five years. After that, as I understand it, we were free from any obligation.

The reason why I and others like me

were kept at the school was that we served as show scholars—as results of the system and evidences of the good work the Institute was doing.

When I first went to the school the superintendent was a clergyman, honest and well meaning, and during the first five years thereafter while he remained in charge the general administration was honest, but when he went away the school entered upon a period of changing administrations and general demoralization. New superintendents succeeded each other at short intervals, and some of them were violent and cruel, while all seemed to us boys more or less dishonest. Boys who had been inmates of the school for eight years were shown to visitors as results of two years' tuition, and shoes and other articles bought in Philadelphia stores were hung up on the walls at public exhibition or concert and exhibited as the work of us boys. I was good for various show purposes. I could sing and play a musical instrument, and I wrote essays which were thought to be very good. The authorities also were fond of displaying me as one who had come to the school a few years before unable to speak a word of English.

Some of my verses that visitors admired were as follows:

THE INDIAN'S CONCEPTION.

When first the white man's ships appeared
To Redmen of this wooded strand,
The Redmen gazed, and vastly feared,
That they could not those "birds" withstand:

As they mistook the ships for birds.

And this ill omen came quite true—
For later came more; hungrier birds.

SLEEP SONG FOR THE PAPOOSE.

Look, little papoose, your cradle's unbound,
Its strappings let loose for you to be bound.

Refrain:—Oh little papoose!.....

On cradle-board bound;

My swinging papoose,

Your slumber be sound.

Tawn little papoose, your mother is in:

She's roasting the goose, on the sharp wooden
pin. Ref.

Bound little papoose, your father is out;

He's hunting the moose that makes you grow
stout. Ref.

Brawn little papoose, great hunter shall be;

And trap the great moose behind the pine tree.
Ref.

My little papoose, swing, swing from the bough.

Grow! then you'll get loose—put plumes on your brow! Ref.

So little papoose, dream, dream as you sleep;
While friendly old spruce shall watch o'er you keep. Ref.

Now, little papoose, swing on to your rest.

My red browed papoose, swing east and swing west. Ref.

Over the superintendent of the Institute there was a Board of Lady Managers with a Lady Directress, and these visited us occasionally, but there was no use laying any complaint before them. They were arbitrary and almost unapproachable. Matters went from bad to worse, and when the Spanish-American War broke out, and my employer, the lawyer, resolved to go to it in the Red Cross service, and offered to take me with him I greatly desired to go, but was not allowed. I suppose that the lawyer could easily have obtained my liberty, but did not wish to antagonize the Lady Managers, who considered any criticism of the institution as an attack on their own infallibility.

While waiting for a new situation after the young lawyer had gone away, I heard of the opportunities there were for young men who could become good nurses, and of the place where such training could be secured. I desired to go there, and presented this ambition to the superintendent, who at first encouraged me to the extent of giving a fair recommendation. But when the matter was laid before the Head Directress in the shape of an application for admission ready to be sent by me to the authorities of the Nurses' Training School, she flatly refused it consideration without giving any good reason for so doing.

She, however, made the mistake of returning the application to me, and it was amended later and sent to the Training School in Manhattan. It went out through a secret channel, as all the regular mail of the institution's inmates, whether outgoing or incoming, was opened and examined in the office of the superintendent.

A few days before the 4th of July, 1899, the answer to my application arrived in the form of notice to report at the school for the entrance examination. This communication found me in the

school jail, where I had been placed for the first time in all my life at the institution.

I had been charged with throwing a nightgown out of the dormitory window, and truly it was my nightgown that was found in the school yard, for it had my number upon it. But I never threw it out of the window. I believe that one of the official underlings did that in order to found upon it a charge against me, for the school authorities had discovered that I and other boys of the institution had gone to members of the Indian Rights Association and had made complaint of conditions in the school, and that an investigation was coming. They, therefore, desired to disgrace and punish me as one of the leaders of those who were exposing them.

I heard about the letter from the Training School, and was very anxious to get away, but my liberation in time to attend that entrance examination seemed impossible. The days passed, and when the 4th of July arrived I was still in the school jail, which was the rear part of a stable.

At one o'clock my meal of bread and water was brought to me by the guard detailed to look after my safe keeping. After he had delivered this to me he went outside, leaving the door open, but standing there. The only window of that stable was very small, very high on the wall and was protected by iron bars—but here was the door left open.

I fled, and singularly enough the guard had his back turned and was contemplating nature with great assiduity. As soon as I got out of the inclosure I dashed after and caught a trolley car, and a few hours later I was in New York.

That was the last I saw of the Institute and it soon afterward went out of existence, but I heard that as a result of the demand for an investigation the Superintendent of Indian Schools had descended on it upon a given day and found everything beautiful—for her visit had been announced. But she returned again the next day, when it was supposed that she had left the city, and then things were not beautiful at all, and much that we had told about was proven.

I had \$15 in the Lincoln Institute bank when I ran away, but I knew that was

past crying for and I depended on \$3 that I had in my pocket and with which I got a railroad ticket to New York.

I was assisted in my escape and afterward by a steadfast friend and had comparatively plain sailing, as I passed the entrance examination easily and was admitted to the Training School on probation.

The Institute people wrote and wrote after me, but could not get me back or cause the Training School to turn me out, and they soon had their own troubles to attend to. The school was closed in 1900 as the Government cut off all appropriations.

When I first entered the Training School on probation I was assigned to the general surgical ward and there took my first lessons in the duties of a nurse, being taught how to receive a patient—whether walking or carried—how to undress him and put him in bed, to make a list of his property, to make a neat bundle of his clothes, to enter his name and particulars about him in the records, and how to properly discharge patients, returning their property and clothes, and all about bed making, straightening out the ward, making bandages and scores of other details. I studied all books on nursing and attended all the lectures. Bed making, as I soon found, was an art in itself and a most important art, and so in regard to other details, all of which may look trivial to an outsider, but which count in sanitation.

This new life was very much to my liking. I was free, for one thing, and was working for myself with good hope of accomplishing something.

Our evenings were our own after our work was done, and tho we had to return to the nurses' quarters at 10.30 o'clock at the latest, that was not a hardship and we could enjoy some of the pleasures of the city. While in the Training School I received my board and \$10 a month pay, a very decided gain over the Institute. Besides, the food and quarters were far better.

After I had been for twelve months in the Training School I was allowed to go to our reservation for a ten days' vacation. It was the first time in nine years that I had seen my old home and I found things much changed. My mother and

grandmother were dead, and there had died also a little sister whom I had never seen. My father was alive and still wandering as of old. Many of my playmates had scattered and I felt like a stranger. But it was very pleasant to renew acquaintance with the places and objects that had been familiar in my childhood—the woods, the streams, the bridge—that used to look so big and was now so small to me—the swimming hole, and with the friends who remained.

I found that our people had progressed. The past and its traditions were losing their hold on them and white man's ways were gaining.

During the visit I lived at the house of my brother, who is ten years older than me and is a farmer and manufacturer of snow shoes and lacrosse sticks. The ten days passed all too quickly.

Since that time I have paid one other and much longer visit to the reservation and have quite renewed touch with my own people, who are always glad to see me and who express much astonishment at the proficiency I show in my native tongue. Most of the boys who are away from the reservation for three or four years forget our language, but, as I have said, there were some of us at the Institute who practiced in secret.

What I saw in the reservation convinced me that our people are not yet ready for citizenship and that they desire and should be allowed to retain their reservation. They are greatly obliged to those who have aided them in defeating the Vreeland bill. The whole community is changing and when the change advances a little further it will be time to open the reservation gates and let in all the world.

Of course, so far as the old Indians are concerned, they will not and cannot change. They have given up the idea that the Mohawks will ever again be a great people, but they cannot alter their habits and it only remains for them to pass away. They want to end their days in comfort and peace, like the cat by the fireside—that is all.

To the white man these old people may not seem important, but to us young Indians they are very important. The family tie is strong among Indians. White people are aggravated because so many

young Indians, after their schooling, go back to their reservations and are soon seen dressed and living just like the others. But they must do that if they desire to keep in touch with the others.

Supposing the young Indian who has been to school did not return to his father's house, but stayed out among the white men. The old folks would say "He won't look at us now. He thinks himself above us." And all parents who observed this would add: "We won't send our children to school. They would never come back to us."

The young Indians are right to go back to the reservation and right to dress and act like the others, to cherish the old folks and make their way easy, and not to forget their tribe. It is a mistake to think that they soon lose all that they have learned in the school. Compare the school Indians with those who have not been at school and a very marked difference is found. You find on their farms improved methods and in their houses pianos, which their wives, who have also been at school, can play. All these boys and girls who have been to school are as missionaries to the reservation.

The schools are doing a great deal of good to the Indians and are changing them fast, and there is another force at work occupied with another change. On all the reservations the pure blooded Indians are becoming rarer and rarer, and the half and quarter breeds more and more common—technically they're Indians. Thus tho the tribe is increasing, the real Indians are decreasing. They are becoming more and more white. On our reserve now you can see boys and girls with light hair and blue eyes, children of white fathers and Indian mothers. They have the rosy cheeks of English children, but they cannot speak a word of English.

After returning to the Training School I completed the two years' course and afterward took a special course in massage treatment for paralysis.

I have since been employed principally in private practice. I like the work and

the pay, tho the former is very exacting. The nurse must be very clean and very regular in his habits; he must be firm and yet good-tempered—able to command the patient when necessary. He must maintain a cheerful attitude of mind and demeanor toward a patient, who is often most abusive and ill tempered. He must please the doctor, the patient's family, and to as great an extent as possible the patient himself. He must be watchful without appearing to watch. He must be strong and healthy. Nursing is tiresome and confining. Nevertheless I console myself with the remunerations, financial and educational, and with the thought that my present occupation, assisting in saving lives, is an advance on that of scalp taking ancestors.

I have been asked as to prejudice against Indians among white people. There is some, but I don't think it amounts to much. Perhaps there were some in my Training School class who objected to being associated with an Indian. I never perceived it, and I don't think I have suffered anywhere from prejudice.

I have suffered many times from being mistaken for a Japanese.

Some people when they find I am an Indian seek me out and have much to say to me, but it is generally merely for curiosity and I do not encourage them. On the other hand, I have good, steadfast, old-time friends among white people.

When I first began to learn I thought that when I knew English and could read and write it would be enough. But the further I have climbed the higher the hills in front of me have grown. A few years ago the point I have reached would have seemed very high. Now it seems low, and I am studying much in my spare time. I don't know what the result will be.

Some ask me whether or not I will ever return to my tribe. How can I tell? The call from the woods and fields is very clear and moving, especially in these pleasant summer days.

NEW YORK CITY.

Detached Thoughts

By Count Leo Tolstoy

[The following fragments from the private journal of Count Tolstoy are here published for the first time.—EDITOR.]

A T popular festivals poles are erected to the top of which persons must climb in order to win prizes. This is one of those forms of amusement in which the entertainment of the spectators results from the danger to life and limb incurred by the competitors. It can exist only in a society in which people are divided into masters and slaves. All our modes of life have been made what they are because this division exists. Acrobats, tavern waiters, manufacturers, factory hands, manufactories and factories of every sort owe their existence entirely to this division of society into masters and slaves.

And yet we would have fraternity in life, while maintaining all the servile forms of life!

It has been decreed that children twelve years old may take an oath. Do these people think that children can be bound in this fashion? Exacting oaths from children is even more immoral and despicable than exacting them from men.

It is thought that autocracy, which is drowning, may be kept up and preserved by linking it with orthodoxy. But autocracy will first drown orthodoxy, and will then be drowned itself immediately afterward, meeting even a speedier fate.

A man is supposed to be dishonored when he is beaten, when he is accused of theft, cheating his creditors, gambling, etc. But if he has signed a death warrant, if he has taken part in the execution of the capital penalty, if he has read letters belonging to others, if he has condemned men to prison, he is in a far worse condition.

Men engaged in a warfare with falsehood and superstition are often satisfied with the quantity of superstitions they have destroyed. This is not right. They should not be satisfied as long as they

have not destroyed everything which is contrary to reason and rests on faith alone. Superstition is like a cancer. If it is operated on at all, everything must be cleaned away. Let the least particle be left behind, and the disease is sure to reappear in a graver form than ever.

If you strike a very hard log, the first stroke sounds as faintly as if you had only struck the air, and you think you will never do anything—that it is useless striking. This is a misfortune you must be on your guard against. You must strike again and again. Soon a dull sound will be heard; it is a sign that you have made a cut in the log. A few more strokes and it is split in pieces.

The world is in the same situation when facing Christian truth; and I remember the time when the strokes fell and I thought the case was hopeless.

The same, too, with men. We must do as that man did who sought to drain the sea. If a man gives all his life to a work, whatever that work may be, it will be realized, and realized the more if it is the work of God.

It is said: One swallow does not make a summer. But altho one swallow does not make a summer, ought not the swallow who feels already the summer to fly, or ought she to stand still and wait? Then if every bud, every blade of grass is to wait also, there will be no summer.

A series of thoughts has occurred to me in connection with the blindness of the men who carry on the struggle with the anarchists by destroying the anarchists and not by reforming the social order, that very same social order whose horrors the anarchists invoke as the source of the conflict.

As the result of an enormous amount of labor devoted to thinking and speaking, reason is gradually making its way among the human beings who conform

to it. Under the most diverse forms, and by the strangest methods, it is subjugating men—some by means of fashion or by vanity; others under a show of liberalism, science, philosophy, religion—and becoming their distinguishing characteristic.

Men now believe that they are brothers, that it is wrong to oppress one's brothers, that progress and education must be aided, and that superstition must be grappled with. Reason is becoming public opinion, when suddenly comes the Terror of the French Revolution, the 1st of March, the assassination of Carnot, and all the labor is lost in vain—just like the water which has been gathered drop by drop and confined within dikes, and which suddenly bursts across its bounds and flows profitlessly over the fields and seed.

Why is it that the anarchists cannot see the prejudice which violence arouses against them? How I should like to write to them on this subject!

Their arguments, the propagation of their ideas on the uselessness and the danger of the violent action of governments, are equitable, and one thing needs only to be changed: They must reply to violence and murder by a refusal to participate in violence and murder.

I have received an Italian work on the teaching of Christianity in the school.

This idea that the teaching of religion is an injustice is a very good idea; it is that perversion of children of which Christ speaks. What right have we to teach that which is disputed by the great majority—the Trinity, the miracles of Buddha, of Mahomet, of Christ? The only thing we should teach is moral doctrine.

An excellent phrase was uttered lately by a person with whom I was discussing the impression produced on peasants by books: It is hard to please them, because *for them life is very serious*.

That is an important phrase. Would that the majority of the men of our *caste* might comprehend it!

I was gazing at an admirable sunset. Gleams of light broke through the accumulated clouds, and yonder—the sun

like a red, flaming coal of irregular form, and all above the forest. My heart was filled with joy, and I thought to myself: No, this world is not a mirage, it is not merely a place of trial, a thoroughfare to an eternal, better world. It is itself an eternal world, a world that is joyous and beautiful, and which we not only can but should make more joyous and more beautiful for those who live with us and for all those who shall live in it after us.

There are two ways of knowing the external world. The one—the rudest and easiest—is the knowledge acquired by the five senses. The world which we know is not formed by this way of knowing; if it were, it would be a chaos which would simply give us different sensations. The other way consists of the recognition of ourselves by self love, and of the recognition of other beings by our love for them. We must, by the power of thought, transport ourselves into another man, into an animal, into a plant, even into a stone. By this method we gain an internal knowledge of things—we conceive the whole world as we know it.

This method is what is called the poetic faculty; it is love. It is the reconstitution of the union between beings, a union that had apparently been destroyed. One issues out of one's self and enters into another being. And one can enter into everything—be commingled with God, with everything.

In every prescription of practical morality there is the possibility of contradicting it by acts which take their rise from the same prescription.

Abstinence—does that mean not to eat at all and so become incapable of serving men? Not to kill animals—does that mean to allow them to devour us? Not to drink wine—does that mean not to partake of the sacrament, not to use wine when our health requires it? Not to resist evil by violence—who then will allow that one man may kill other men?

The importance attached to such contradictions only shows that the man who troubles himself about these things does not wish to work for the moral elevation of the people.

It is always the same story; because a man needs wine for his health, he must

not fight against alcoholism; because of imaginary acts of violence, he must kill, arrest, imprison.

The death of children from the ordinary point of view is bad. Nature endeavors to give the creatures that are best, and she takes them back when she sees that the world is not yet ready for them. But she must make an effort in order to advance. It is the same with the swallows who arrive too soon and die of cold. In spite of this, it was right that they should come.

This usual style of reasoning is bad. The right reason is that the child who dies has accomplished the work of God

—the establishing of God's Kingdom by the augmentation of love—far better than certain persons who have lived half a century or more.

Love, love him who has done thee evil, him whom thou hast blamed, whom thou hast not loved, and all that concealed his soul from thee will vanish, and when thou beholdest down in the depths, as if through pure water, the divine essence of his love, thou wilt have no need and thou wilt have no power to pardon him. Thou wilt need only pardon for thyself, for thou hast not loved in Him in whom he was, because thou hast banished My love from thee and hast not seen it.

YASNAYA POLIANA, RUSSIA

The Mob and the Law

By Winfield T. Durbin

GOVERNOR OF INDIANA

[Governor Durbin has won the admiration of the whole nation for the courageous and unflinching stand he took against the mob and the mob spirit during the Evansville riots. We are very glad to give to our readers his views on this increasing danger which threatens our democracy.—EDITOR.]

IT is a dangerous thing to possess free institutions without knowing the cost at which they have been attained or realizing that eternal vigilance is the price of their maintenance. Back of absolutism is the will of an autocrat, whose continuance in authority is contingent upon the resolution with which he guards the institutions that make his power possible. But back of free institutions is only the popular will of which they are the expression—the vast responsibility of preserving them inviolate diffused among millions. The machinery of monarchical government is everywhere apparent; the pomp of courts, the pageantry of fleets and armies, the strong arm of authority relentlessly lifted to make respect for the law compulsory, wherever it is not voluntary. These things make it impossible for those yielding allegiance to a crown to forget that they have a government, and that it may not with impunity be obstructed in the exercise of its functions. But to the people

of our republic the semblance of national authority—the authority which stands back of the elemental guaranties of our government—is not a familiar sight. To millions of our people the sight of a soldier is a rare one; to millions, so far as personal knowledge extends, there might not be within the borders of the republic a fort or a garrison, while millions more, scattered across the wide stretch of our national domain, have never looked upon a battle ship. The machinery of our Government moves noiselessly; it is in effect invisible. Those in authority are citizens among citizens, vested with responsibility for a season, and then returning again to the occupations and associations from whence they came. A government such as this realizes the ideals of the founders of the Republic and the aspirations of those who believe that an "inalienable right" of man is the broadest liberty consistent with the rights of others, that with this essential qualification the least govern-

ment is the best government. And yet it is easy to understand how it is that under such conditions the patriotism of a generation which has received free institutions as an inheritance, which has neither won them nor defended them and looks infrequently upon the things that symbolize the national authority, may lapse into lethargy in an era of commercialism such as that in which we live.

To lose all that inheritance which has come down to us from the centuries through the struggles of men seeking to be free, from Runnymede to Lexington and from Lexington through all our splendid history to this hour, it is not necessary that we should repudiate our legacy. A failure to rise to the duties and responsibilities such an inheritance implies will, if sufficiently continued, bring it all to naught, despite our self-satisfied belief in a destiny decreed only for a people worthy of its opportunity. It is not enough even that we shall give passive approval to our institutions and indifferent acquiescence to our laws. The duties of citizenship transcend such narrow limitations. The fires of patriotic fervor set ablaze upon our shores a century and a third ago and which have lit up the pathway of the Republic from that time down to this must be refreshed by each succeeding generation of Americans, lest they die away. This government was established, it has been maintained, it can endure, only because it embodies the aspirations of a united people and round about it have centered their loyalty and love.

Evidences of the negative possibilities of patriotism grown quiescent, of respect for law decaying through sheer forgetfulness of first principles, of a popular will vitiated through

lack of conscious exercise and faltering in the execution or the defense of laws which are its own expression, are at hand in the rise of a mob spirit utterly without palliation in a country where all laws are popular creations and where all officials exercising administrative and judicial functions are made and may be unmade at the ballot-box. Yet there seems to be scarcely a community within the shelter of our flag and all for which it stands where there does not lurk incipient a spirit which, once aroused, prompts citizens of a Republic in the madness of animal fury to dash themselves insensately against the barriers erected by centuries of civilization between brute force and human rights; to trample their flag in the dust, and to drag through the mire of the gutter the constitution of their country, with its sacred guaranty of the inviolability of life and property except through the orderly processes of law.

The methods of extenuation adopted by a few public and many private apologists for lynch law have become familiar. The awfulness of the crime and the outraged sense of justice it arouses are pictured in palliation. But the essential issue raised by the rioters is not between

the mob and its victim or his crime, but between the mob and the law. The law is as much outraged by a lynching based on a heinous crime as by a lynching without provocation. If there is a shadow of justification for mob law in vindication of the virtue of woman, there is the same justification for its exercise in punishment of any other crime or no crime at all: for the mob is, as Benjamin Franklin said, "a monster with many hands and no brains." Its only

WINFIELD T. DURBIN

claim to jurisdiction is that of the mad dog—that of blood-thirstiness and brute strength—and if bloodthirstiness and brute strength are to be given license to batter down the bulwarks of law and order, where is there safety for the life or the honor of any one? There are instances without number in which the mob spirit, once aroused, has led to the pursuit of objects entirely foreign to that which brought it into being. A riot inaugurated in the name of race feeling may culminate in an assault upon soldiers merely because they represent the authority of the State to which the rioters owe allegiance, or in any other lawless excess. The sweep of the mob spirit through a community is like the rush of water through a sewer; it collects and tosses into the flood all that is vilest in its pathway, and before the course of the current is run the filth is on the surface. The delays of the courts and the dissimulation of officials in the execution of the laws is often assigned as an explanation, if not in palliation, of the mob spirit. By whom are judicial and executive officers chosen? Who, in a representative government such as ours, is to be held responsible for the delays made possible in criminal procedure? The responsibility inevitably falls back upon those who seek to make the shortcomings of their servants in authority an excuse for overriding the law. By whom were the delays of the law deliberately delayed? They are in large part the safeguards reared by the people themselves for their own protection against summary procedure. What member of an American mob, charged with crime, could look upon these safeguards otherwise than as essential accompaniments of free government?

We are sometimes told, usually by inference, that mob law is essential to the proper regulation of the relations between the negro and the white man. What better method of breeding lawlessness among black men than by forcing them to the belief that the Anglo-Saxon, with all his boasted love of fair play, denies to them the justice he demands for himself: that tho the negro may stand accused of a crime of which he is innocent, the tribunals in which innocence is presupposed are closed to him, and he may be heard only in a court where the

accuser is at once the judge and executioner? If we really have faith in the great principles for which Washington unsheathed his sword we can have little patience with the sort of Americanism that offers such a plea in extenuation of organized crime. The man who, inspired by the stupid passion of race hatred, would prescribe the halter and the torch for an entire race because individuals of that race sometimes commit offenses for which our laws prescribe befitting penalties, has not within him a spark of that regard for the rights of the weak which made this Republic possible.

Let us place against these apologies for mob rule a few essential and well established principles. No government can endure with the court and the mob seeking to exercise identical functions. Either the supremacy of the law must be established beyond question, or free rein must be given to the fury of riotous assemblages engaged in trampling all law into the dust. Anarchy and constitutional government may not thrive within the same geographical limits; we must ultimately altogether give up the one or the other. If guilty men are to be hanged or burned by "good citizens" to-day under the summary procedure of brute force, then innocent men may be hanged or burned to-morrow by bad citizens operating under the same warrant; because brute force is no respecter of persons or principles and may as readily be invoked in a bad cause as in a good one. If the mob spirit is to become the national spirit, and, being contagious, it must either be stamped out or its ultimate supremacy conceded, then the next step in our political "development," if history teaches anything, will be the sway of that dictator who proves himself to be the best leader of mobs.

The man who takes the law into his own hands is a tyrant to the limit of his opportunities, regardless of the pretext by which he undertakes to justify his occupation, either to himself or others. The man who joins others in nullification of the rights of his fellows, no matter what his ostensible purpose, has opened war on the Declaration of Independence. The man who invokes violence in an assault on the law must be struck down by the law's strong arm. The sheriff and his deputies who employ the Winchester

rifle and the shotgun in defense of a prisoner whom a mob seeks to murder, the militiamen who co-operate with them in the law's behalf, are as much soldiers in the cause of liberty as any patriot who fought at Bunker Hill or King's Mountain; and those officials, sworn to the execution of the laws, who yield to the mob spirit in such an emergency are guilty of as base poltroonery as the sorriest coward who ever fled from a battlefield.

Let the American people take to heart the issues involved in an appeal to mob law, and the mob spirit will instantly disappear as a national phenomenon. For the people are loyal, they are freemen in fact as well as in name. We might grow hopeless in the face of an evil which would seem imminently to threaten the very foundations of our government if we did not better understand the real temper of American citizenship. We need only a national awakening to what this issue implies. We need a strengthening of the arm of authority, widening and deepening respect for the law by its

enforcement without fear or favor. We need an inculcation among all our people of the elementary principles of Americanism—a national necessity to which Abraham Lincoln gave expression when he said:

"Let every American, every lover of liberty, every well wisher of his posterity, swear by the blood of the Revolution never to violate in the least particular the laws of his country, and never to tolerate their violation by others. As the patriots of 'seventy-six' did to the support of the Declaration of Independence, so to the support of the Constitution and the laws, let every American pledge his life, his property and his sacred honor; let every man remember that to violate the law is to trample on the blood of his father, and to tear the charter of his own and his children's liberty. Let reverence for the laws be breathed by every American mother to the lisping babe that prattles on her lap. Let it be taught in schools, in seminaries and in colleges. Let it be written in primers, spelling books and almanacs. Let it be preached from the pulpit, proclaimed in legislative halls, and enforced in courts of justice. And, in short, let it become the *political religion* of the nation."

INDIANAPOLIS, IND.

Studying the Effect of Preservatives on Health

By Harvey W. Wiley, Ph.D., LL.D.

[Since the question of the harmfulness of the different preservatives used in food has become an important factor in national and international policy, as in the case of the food supplied to our soldiers and of recent tariff wars, the need of accurate data on the subject based on rigid experimental evidence has been strongly felt. In view of the numerous sensational and not always disinterested articles in the daily press on this question, this report on the recent experiments on the effect of preservatives on health, which have been carried on in the laboratory of the Department of Agriculture by Dr. H. W. Wiley, chief of the Division of Chemistry and the foremost authority on the chemistry of foods in the United States, will be read with interest by the many readers who have been learning so much recently of the "borax boarding house."—EDITOR.]

FOOD experiments have been conducted from remotest antiquity, but perhaps not with all the scientific accuracy which characterizes the experimental work of modern times. The first recorded food experiment which I have been able to find is described in the Book of Daniel, first chapter, twelfth verse and following.

When Daniel was brought into the royal household of the King of Babylon he was required to eat the food prepared for the king and the court. This the

prophet was not willing to do. The chief of the eunuchs, who had taken a great fancy to Daniel, was greatly worried over the situation and informed the recalcitrant Israelite that the king would hold him responsible for the poor physical condition which Daniel would doubtless acquire if he failed to eat of the rations prepared for him. Daniel thereupon proposed an experimental test, based on a truly scientific principle, tho not attended with that nicety of chemical analysis which to-day is the primary condition of

such work. He said to the prince of the eunuchs:

"Prove thy servants, I beseech thee, ten days and let them give us pulse to eat and water to drink. Then let our countenances be looked upon before thee, and the countenances of the children that eat of the portion of the king's meat; and as thou seest, deal with thy servants. So he consented to them in this manner and proved them ten days. And at the end of ten days their countenances appeared fairer and fatter in flesh than all the children which did eat the portion of the king's meat. And in all matters of wisdom and understanding that the king inquired of them he found them ten times better than all the magicians and astrologers that were in his realm."

Pulse, we find, is a thick pap or potage made from meal, presumably the meal of leguminous seeds, such as peas and beans or other similar leguminous plants. At the present day, in the light of modern investigations concerning nutrition, we would be inclined to think that Daniel's ration was a very narrow one, in which the carbohydrate element was decidedly deficient. We are surprised also to learn that on such a diet, which is not regarded as fat producing, their countenances became fatter than those of the children who ate of the king's meat. If we should construe the language literally our surprise would not be so great, because "meat" might be particularly lean meat and thus the ration of the king's children be even narrower than that of Daniel and his fellows. But this we are hardly justified in doing, since the term "meat" is evidently used in this sense as a general expression for a diet in which, presumably, the carbohydrates bore a prominent part. In one respect at least I have followed pretty closely the line of experiment which Daniel outlined some three thousand years ago, in that I have made the periods of experiment approximately ten days.

In the experiments which I am about to describe, however, instead of pulse and water being the principal items of diet, I have substituted therefor borax and boracic acid. According to the newspaper reports, which unfortunately are not always reliable, the results of my experiments have been very similar to

those of Daniel, since it has been proclaimed from one end of the country to the other that the children of "Borax" when their countenances were looked upon were shown to be pinker and fatter than those of the children of pork and beans. So general has this impression become that one of the distinguished members of the Supreme Court, Justice Brewer, remarked in an after-dinner speech not long ago that he felt in looking at the fair, rotund faces of the guests that he might be addressing Dr. Wiley's borax boarders.

The primary object kept in view in the experiments which we are conducting is to determine by strictly scientific means the effect of preservatives, coloring matters and other substances added to foods upon the health of the consumer and upon digestion. We find in literature the most varied opinions of experts, so-called, concerning these matters. Practically every substance which has been used in foods for any purpose, aside from the foods themselves, has been the object of condemnation on the one hand and of praise on the other. Salicylic acid, formaldehyde, borax, sulphurous acid and benzoic acid all have their apostles who declare their use in preservative quantities not only harmless but positively beneficial. On the other hand we find another set of experts which indiscriminately condemns the use of any preservative or coloring matter whatever. We must be allowed to say that the burden of proof should fall upon the advocates of preservatives and coloring matters. It is not claimed that these are substances natural to food and their addition must therefore be positively justified. Negative results are condemnatory. If these bodies do no good they have no reason for existence; if they are injurious they should surely be prohibited; if they are beneficial under certain conditions, those conditions should be ascertained and definitely fixed.

The experiments were conducted upon twelve young men connected with the Department of Agriculture, who pledged themselves to obey all the rules and regulations prescribed for them, to eat or drink nothing except what was given them in a weighed or measured condition at the tables, to undertake no unusual labor or exercise, and to continue

in the even tenor of their lives during the period of observation. This period lasted for seven months, beginning December 1, 1902, and ending June 30, 1903. During this time exhaustive experiments were conducted with borax and boric acid in large and small quantities, given with the food and also given separately in capsules. All foods consumed were carefully analyzed, all excreta collected and analyzed, and thus an exact balance sheet was kept with each individual. The enormous quantity of data obtained in these experiments is not yet collated, tabulated and averaged, and therefore we are unable at the present time to draw conclusions of a definite nature. I may say, however, that our experiments are the most elaborate and extensive and long continued of any that have ever been undertaken, and we hope that the conclusions which we finally draw from them may be accepted for their full value as established by the character and conduct of the work.

Experts who have performed similar, tho not such extensive, experiments are greatly divided in regard to their opinions respecting the effect of borax and boracic acid on the health. The chemists and physiologists of the Imperial Board of Health of Germany are decidedly of the opinion that borax and boric acid are harmful to the human organism. On the other hand, Professors Chittenden and Gies, of Yale University; Professor Tunnicliffe and Dr. Rosenheim, of London; Professor Vaughan, of Ann Arbor, and Professor Liebreich, of the University of Berlin, are of the contrary opinion. In my own opinion, which I give below, I wish it to be distinctly understood that it does not represent, or may not represent, the conclusions which we will finally deduce from the data which we have obtained. I prefer to state my views in a general way rather than as applicable to borax and boric acid.

First I will state that for all ordinary purposes foods can be preserved without

recourse to any of the so-called chemical preservatives, meaning by these the ordinary preservatives used, with the exception of common salt, sugar, vinegar and wood smoke. These latter named preservatives have been in use from times immemorial; they reveal themselves by their taste or odor, no one is deceived in eating food containing them, and their universal employment is acknowledged as necessary by the highest experts in chemistry and physiology.

On the other hand, so-called chemical preservatives have, as a rule, scarcely any taste or odor, do not reveal themselves to the consumer by any physical or chemical property, and thus could be eaten in great quantities without exciting the suspicion of the consumer. I do not believe that such preservatives should ever be used except in cases of absolute emergency where foods could not be preserved without their use and where fresh foods could not be obtained.

At the same time I will say that I am a firm believer in the doctrine set forth in the Epistle to the Colossians, second chapter and sixteenth verse, where it is said: "Let no man therefore judge you in meat, or in drink, or in respect of a holy day, or of the new moon, or of the Sabbath days," and also the doctrine set forth in Romans xiv, verses 2 and 3: "For one believeth that he may eat all things; another, who is weak, eateth herbs. Let not him that eateth despise him that eateth not, and let not him which eateth not judge him that eateth."

In other words, what a man eats and drinks are matters of his own conscience and should not be determined by others. I would not therefore deprive any one by law of the privilege of eating borax and boric acid, salicylic acid, sulphites, benzoic acid and formaldehyde, if he so desired. On the other hand, I would protect those who do not wish to eat those things to the full extent of the law from doing so unwittingly.

WASHINGTON, D. C.

The White Follower

By T. Jenkins Hains

AUTHOR OF "WIND-JAMMERS," "MR. TRUNNELL," "CRUISE OF THE PETREL," ETC.

HE was a little more than fourteen feet across the tips of his outspread wings, more than two full fathoms, and his great white breast, full and rounded, was as broad as that of the man who stood at the wheel and watched him go soaring past. The very tips of his huge wings were black as jet, showing in marked contrast to the unbroken whiteness of the rest of his feathers, and the only other dark spot upon his snowy form was his eye. This was as black and shiny as the lanyards in the rigging. It was large and held a steady gaze, fearless yet curious, so that when the man at the wheel looked up the bird tilted his head to one side to get a better view of him. The giant beak, nearly a foot in length and of heavy bone, had a strangely hooked end, which swelled a little in size from the middle portion. It was a serviceable pair of shears which could cut a five-pound fish in two at a bite. The two webbed feet, as large again as those of a swan, were held close in to the short tail feathers so as not to offer resistance to the air, through which the bird went at the speed of an express train. Silent and otherwise motionless, save for that turn of the head, the great creature swept past. Not a movement of leg or pinion, not a feather disturbed in that headlong rush. With the great wings stretched far out and slightly bowed, he held his way and tore past the fast running ship as tho she were at anchor, instead of plowing through the southern ocean at the rate of ten knots an hour with the wind behind her. Then, as she was left far astern, he tilted himself a little, and off into the curve of a tremendous circle he swerved, swinging with the speed of the wind over the rolling wave-tops until he had covered at least three miles upon the arc and was heading swiftly back again to repeat the maneuver.

All the time that large black and shining pair of eyes watched the surface of the sea. Not a morsel of anything went overboard unobserved. From a distance

of a mile or more the huge bird would note the smallest bits of food or grease which the cook would toss over the side when cleaning his coppers for a new mess of salt junk. Sailing over the bits of floating stuff he would hover a moment to see if they were really worth tasting. If so, he would soar in smaller and smaller circles until he would breast a sea. Then, dropping his legs and bracing his feet to retard the slowing flight, he would sink into the water and check himself with both feet and wings until his body finally rested gracefully upon the surface. Folding his pinions slowly and a little stiffly, he would propel himself like a huge goose toward the floating prize and make a pass at it with his beak. Salt-pork rind, gristle, anything that had grease or taste to it, was chopped by the bony shears and quickly bolted. It mattered little just what it was as long as it had some grease or taste to it. His appetite was not squeamish.

When nothing remained he would slowly and stiffly again stretch out those wings and face to windward. Then he would propel himself along into the breeze until he rose upon a sea. A quick couple of strokes with the pinions and a sudden push with both feet generally lifted the great body clear of the water before it began to sink down the slope of the succeeding sea. After that it was but a detail to rise higher and higher into the clear air without perceptible motion save of rushing ahead and circling in spiral curves, which no mathematician might describe or define as a means of ascending.

The ship was something over six hundred miles off shore. She was heading for the last corner of the world, Cape Horn, to turn it and then go northward up the south Pacific. She would head up the middle of the great ocean and at times she would not be within a thousand miles of any land whatever.

For more than two weeks the albatross had followed in the wake, his tireless

pinions showing no signs of weakening by the continuous flight. Steadily night and day he had followed and the men aboard had watched him with the awe all deep-water men feel for the giant birds, who seem to be able to soar through space for a lifetime without tiring. Sometimes when he came up astern he slackened his pace by some method and remained for a short moment poised a few fathoms above the man at the wheel. Then his steady look as he slanted his head sideways made the man have a queer feeling, as tho he were almost in communication with a stranger from the realms of space. When the captain happened on deck he paid considerable attention to the follower, but he never thought to harm him. The Winchester, which he often used to take snap shots at blackfish, was always laid aside at his approach.

The great bird noted this. He was not afraid of the rifle, for altho he saw the effects of the shot, he knew nothing of its power. The man was a creature of the earth like himself and he had no reason to suspect him of harmful purposes simply on that account. He was interested in him and a not unfriendly feeling came within his breast.

In the latitude of the "roaring forties" the weather is uncertain. Sometimes it blows high and sometimes low, which latter means it is dead calm for a spell. Under these conditions a sailing ship naturally comes to a sudden stop, and, with clewed up courses, rolls and switches away often for days without making more than a degree of southing.

It was during one of these calm spells that the captain began to formulate a plan which would bring him in closer contact with the great bird which still soared and circled about the ship. He rigged a trolling line with a bit of wood for a float near the hook. Then he baited it with a piece of salt beef and tossed it over the side.

The ship was barely moving, but still had headway enough to get away from the bait. When it was fifty fathoms astern the captain held the line and waited.

The albatross soon sighted the piece of beef and circled slowly toward it. Then as it floated in clear view he settled upon

the surface of the sea and paddled up to it and gave it a chop. He cut away half the beef, but missed the hook, and the captain's jerk upon the line merely pulled it from him. He made another grab, and as he did so the line tautened and the barb of the hook caught under his beak.

Hand over hand the captain hauled him in. He spread forth his wings and backed water hard with his feet, but the seaman kept a steady strain upon the line and prevented the hook from slipping clear. Soon he was directly under the ship's counter, and as she squatted down into the hollow of a swell the captain quickly hauled the bird over the rail to the deck.

Inside the poop-rail it was impossible for the albatross to get headway enough to rise into the air, the wind was so unfavorable in the shelter. While he might waddle about upon the white planks it was as impossible for him to get away as tho he had been chained by the leg. It was most provoking to be in such an absurd position. The man at the wheel grinned at him, and the mate came up to take a better look at close quarters. He stretched forth his wings and tried to rise by a series of powerful strokes, but it was in vain. He only managed to go plunging into the rail before he got his feet clear of the planks. This made him angry and he snapped at the mate, making a savage chop with his great beak, which came together with a loud clap. But the seaman jumped aside, and the captain admonished him to keep away.

Gradually the feeling of being upon a floating thing with other creatures seemed less strange. It was remarkable how different the ship was now that he was on board it from what it appeared while he was a few fathoms in the air. Yet he had followed it so long that he had become accustomed to it, and the unpleasant sensation of becoming suddenly a prisoner aboard gave place to that of curiosity. The captain brought some choice fat and ordered the steward to keep the slush from the coppers as clean as possible and give the stranger as much as he wished. After eating several pounds he lost for the time all desire to get away and waddled about the quarter-deck perfectly satisfied with the sudden change in his condition.

The ship's dog rushed up and made a savage attack, and for a few minutes the great bird was frightened, for the noise was distracting and a sudden bite gave him pain. Then the captain dragged the animal away and gave the newcomer a choice piece of salt pork to make up for the lack of courtesy shown by the dog.

There was much of the dog's spirit aboard the ship, altho it was not manifest to the albatross. Among the men forward were several who had much the same feeling for their fellows. Under the cover of bluff and honest exteriors they concealed dispositions like that of the dog. They were a type of what is known as "sea lawyer," and were always dwelling upon the grievances of sailors and the rascality of mates and masters. Close and intelligent observers would have noticed at once that the faults their leader saw in others were the ones rising to the surface in himself and which he was trying to conceal. He was saturnine and his ugly little eyes held an unpleasant look every time he came in the vicinity of either the mate or captain. The second officer was in the other watch and therefore not often about to give him orders.

As the vessel gradually made her way southward and the hardships became more trying with the colder weather, the feeling aboard among the men who listened to the grumbler became more sinister. The captain was not such a man as to let things go unnoticed, but as long as there was no direct disobedience of orders he took no action and let the mate warm up the discontented men with extra work, for it is well known that hard work will do more for an ugly crew than any medicine.

The captain spent much time on deck and made a pet of the bird he had captured. He was a generous man and lonesome among the rough fellows who made up the crew, for his position forbade any intercourse whatever with any one except his first officer. Even this seaman, able and intelligent as he was, could not be made more of than a slight acquaintance. Such is the rule aboard deep-water ships, for discipline must be enforced if safety is to be considered.

During many lonely hours the master tried to reconcile the dog to the new-

comer. The old wolf spirit bred through thousands of generations of the land animal was not easy to pacify. It was the old spirit of suspicion for strangers based upon the experience of hundreds of ancestors, who had perhaps trusted not wisely but too well in the days when all living things were at war with each other and only the strongest and most cunning might survive. It was as evident in the dog as in the men of the fore-castle, and the master studied carefully and comprehensively to subdue it, or at least pacify it to an extent that strife might be averted. Kindness and unselfishness were the two antidotes he would employ.

The great bird was not slow to notice his friendship. After a day or two he was on the lookout for the master, who appeared regularly to take his morning observation for longitude, and he walked laboriously up to him in spite of the dog's yelping. There was something in the man's behavior that made him instinctively his friend. Finally even the dog's suspicions were allayed, and instead of seizing the bird's feathers in the rear to jerk them and then dodge the snap of the beak, he met the bird face to face and refrained from either a bite or bark. The two became reconciled.

During several days the albatross waddled about the quarter-deck and was fed, until the captain, fearing that he would grow so fat he would be unable to fly, finally took him in his arms one day and placed him upon the rail. Then he tied a bit of fancy red cord about his leg so that he might distinguish him from other birds that would follow in the ship's wake. The great bird had long ago learned to eat from the man's hand and took care not to chop too close to the fingers with his powerful beak. The master would stroke the beautiful white head and smooth the snowy feathers until the petting became a thing looked forward to. It was a smooth day in the latitude of the Falklands when he determined to set the captive free, and the dark water seemed less attractive than usual under the gloom of the overcast sky. The lonely cry of a stray penguin broke now and again upon the ears of the listening seaman and had a depressing effect.

With a last caress he gave the pet a

gentle push to start him. The great black eyes looked hard at the sailor, and then, with the giant wings outstretched, he swung off in a graceful swoop, curving upward as the falling body nearly touched the sea. He was gone.

That night it came on to blow hard from the westward. The ship, nearing the latitude of the Horn, was shortened down to her lower topsails, and with the wind snoring away under them and past each taut downhaul, clewline and hal-yard, she was hove to. It was necessary to try to keep her from sagging off to the eastward, for in this latitude every mile counts.

During the morning watch the mate had reason to call the captain, for, with a falling glass and shifting wind, he was on the lookout for a definite change.

The captain came on deck and took in the situation. It was still dark, but the growing light on the horizon told of the approaching day. He stood near the man at the wheel a moment and the mate went forward where the green seas sometimes rose above the topgallant rail and fell upon the deck as the staggering ship plunged into the trough. Through the dim, misty light of the early morning he saw the watch turning out to clew down the foretopsail, and as the foremost man took the ratlines he turned and walked to the binnacle to watch the shifting course.

The increasing gale and gloomy prospects had caused the grumbling element among the crew to be more careless than usual, in spite of the master's efforts to pacify them. The leader of the malcontents came aft with two others to take a pull in the spanker sheet, for upon the boom had been bent the storm trysail to hold the vessel's head up to the gale while hove to. The men hauled surlily upon the line, but it came in so slowly that the mate came aft and spoke to them to stir them up. Then they flattened it in, but the stout landsman, or ordinary seaman, who was taking in the slack upon the cleat, failed to catch a turn. A tremendous sea hove the ship to leeward almost upon her beam ends. The struggling men were hove against the lee rail, and the sheet, whirling loose from the fellow's hands, caught a turn about his body and in an instant he was flung over the side.

The captain, who had just stepped out from the wheel-house, made a grab to seize him, and a turn of the now flying line caught him around the ankle and jerked him also over the rail into the sea. Then followed the dreaded cry of "man overboard" and the confusion of a crew of men without a leader.

The mate with ready knife cut away the lashings of the quarter-buoys and let them go overboard. Then he tried to fling a line, but the ship was moving too fast. She was forereaching heavily, but in that sea it was madness to think of trying to stop her by laying the yards aback, or losing control of her in any way. She must go on. They might shorten her down enough to stop her, but even if they could do so within half an hour she would be too far away to see a man in the water and the sea too heavy to think of lowering a small boat.

Daylight was breaking over the stormy ocean and the roar from aloft was sounding louder with the increasing gale. Many of the men forward had not seen the incident and the cries of those upon the foretopsail yard to those on deck could be heard. From a bunch at the weather clewline came a faint strain of a "chanty";

"Ole stormy, 'e was a good ole man—
Singing yo, ho, ho—with a hey—bar-rrr."

The absurd chorus struck forcibly upon the ears of the master, who with both hands gripped the life-buoy and kept his head clear of the breaking seas. The mate, leaning over the taffrail, bawled something to him he could not understand, and then the ship drifted to leeward with the faint sound of singing still in his ears:

"Ole stormy, 'e'll come walking home,
Singing yo, ho, ho—with a hey—bar-rrrrr."

"Ole stormy, 'e has gone to sea—
But 'e'll not come back, with a hey—bar-rrrr-rrrrr."

The words of a "chanty" are generally grotesque and meaningless, but it was this very absurdity that struck the listening master as fraught with meaning. It was significant of his ending. He would not come back again.

The water was quite cold, and to make certain that he would not lose his hold upon the cork float he passed his head

through the circular opening and made his body fast with the hand-line to the buoy at both sides, so that he would balance evenly. He would do all he could to live, and if he floated long enough they might pick him up after all. The minutes dragged into hours and cold and exhaustion caused his mind to wander. He fancied he saw green fields again and was back in the land of his birth. The suffering of passing was almost over and it held no terrors for him. He had tried to do what he could aboard the ship to make things less hard for his men. Perhaps if he had been more savage he would have done better, for there are some men who cannot be touched save through great bodily fear.

The dawn of the southern day had broken over the heaving ocean and at times he would try instinctively to look for the ship. She had disappeared. Nothing but the great rolling seas as far as the eye could reach, and these turned now and again into grass grown hills before his failing vision.

It was late in the morning, after the daylight had become strong, that he fancied he heard a dull, thunderous noise. It had little effect upon him now, for he was too far gone to pay much attention. The noise grew louder and louder as the minutes passed and suddenly his dulled brain became alert again. He looked toward where the sound came from and it was from the northward and behind him, and through the haze of the flying spume-drift he saw the dark gray shadows of rocks. He fancied his mind was at fault, and in spite of the heavy roar which now filled the air he paid little attention. Then he was hove nearer the ledge and felt the rush of the lifting sea.

It spurred him to recover. He dashed the salt water from his eyes and made a desperate effort to realize his position. Then a great, high rolling surge that had run for miles across the southern ocean picked him up on its crest and bore him shoreward with the speed of the wind. As it broke into a white smother of foam he saw clearly at last that he was being hurled upon the rocks. He struggled to keep his head out of the boiling rush and looked for a place where he would strike. To hit the ledge at the speed he was going meant instant death, and he tried to

see if there was no slue or opening into which he might be hurled. The current of the Antarctic had caused an eddy within a few miles of the rocks of Hermit Isle, in which he had drifted, and it had carried him toward the land at a rapid rate.

Rising upon the roll of the crest, he just managed to keep from striking until the weight and speed of the breaker had been exhausted. Then by chance and the aid of the buoy he managed to float into a crevice between the rocks and cling there until the back-wash had left him almost high and dry. With the last remaining energy left he hauled his body clear of the tide and lost consciousness.

When he regained his senses the sun was well upon the northwestern horizon. The wind had gone down considerably and heavy, oily looking clouds were hurrying past overhead, with breaks between them. He felt the sting of sleet upon his face and the chill from his wet clothes almost paralyzed him. He staggered to his feet and gazed about him. Then he crawled higher up the rocks.

There was no doubt about it, he was upon the rocks of Cape Horn. He was clear in his mind now and remembered his struggles, and he had seen the ragged hump too often not to recognize it at once. How his ship had been driven in so close was hard to guess, but he knew the treacherous currents of the Drift and remembered that a careless helmsman might very easily nurse the vessel off her course with the help of an unknown set to the northward.

While he looked about him he became aware that he needed nourishment very badly. He was faint with the long swim and continued exposure to the cold water and he must have remained unconscious for many hours after coming ashore. There was nothing to eat upon the ledge. Tufts of the great tussac-grass shot up here and there upon the heights above him, but there was nothing that looked as if it might be used to prolong his life.

But a seaman is never beaten until he dies. The master would not despair. He sat a moment and studied the question. Then he arose again and clambered painfully up the crags, hoping that he might find some Cape pigeon eggs upon the higher terraces. There was not a sign of

anything except a great rock-hopper, or penguin, who skipped nimbly down and plunged into the sea with a loud cry before the sailor could reach him. Some thirty feet above the ledge upon which he landed he discovered a pool of half stagnant water, but it was not salty and came from the melted snow and sleet. He drank some and felt better, altho it made him colder. He felt through his clothes for a match, but found the metal case in which he carried them had failed to keep out the sea water. His numb fingers could scarcely open the case, but he finally placed the little sticks in a lee, where he hoped they would dry enough to light. Then he sat down and waited, and before he knew it he had fallen asleep.

The sun had swung up again in the northeast when he opened his eyes and the weather was less ugly. He tried his matches. First one was scratched carefully upon a dry piece of stone. The head crumbled slowly away. A bit of smoke seemed to start from it and the seaman's heart beat rapidly. Then the head fell away, leaving the bare stick. It was worthless. He tried another of his scanty store. He grasped the little stick close to its head of composition and drew it very carefully upon the rock. A bunch of finely shredded grass, perfectly dry, was rolled into a ball to catch the first spurt of flame. The match cracked softly and at each noise the sailor's heart seemed to stop. His hand shook violently. Then the head of the match crumbled again and his spirits sank within him. It was life or death, for he must have warmth soon or perish. He had only three more fuses and he stopped a little to think of some way he might make them burn. He gazed steadily at them for a long time and then took up one. It failed.

Hope died away as he took up the other two. He struck them carefully as before, but they were spoiled. Then he cast the grass from him and looked out to sea.

He had been gazing for a long time before he was aware of a form which appeared circling over the ocean beyond the lift of the breakers. It was that of a huge albatross, which had come in from the sea and was apparently looking for a sheltered place upon the Horn to rest.

The master gazed at the great white form skimming along over the wave-tops and remembered his pet. The bird appeared larger than the one he had caught, but all of the great Cape albatrosses were so much alike that he could not distinguish between them. He watched the bird circle about him and finally noticed that he had been discovered, for the creature came nearer and nearer at each sweep until he caught the look of its eye as it bent its head a little in order to observe him better. The albatross was evidently hungry and it might take very little indeed to invite an attack. The bird was practically carnivorous, for it ate anything in the way of flesh it could capture. It was very powerful and could get the best of a man without much trouble, provided the man was incapable of vigorous defense. The thought made him alert and brought to his own hungry self the idea of capture. He might do worse than eat a thirty-pound bird during his stay ashore. He could not cook the creature, but that would be of but small consequence in his present state. The food was the main thing and it was necessary to get something at once.

The bird came closer and closer until finally with outstretched wings and projecting feet it backed against its own headway and settled upon the ledge not twenty feet distant.

The captain's heart beat high with expectation. He lay perfectly still watching it, hoping that it would come near enough for him to grasp it. If it was strong enough to conquer, it was well; he would soon be dead anyway without food. If he could master it by gripping its throat, he might live for many days.

The bird came straight toward him. He was quiet as a cat waiting for a spring, his eyes glaring at it as it approached. Then something attracted his attention. Upon the right foot of the bird was a bit of cord. Yes, there was no mistake, it was his pet, the bird he had captured. He started up with a cry, but the bird came steadily toward him without fear and in an instant was poking its great beak into his hand for food.

The seaman's heart was beating wildly. Here was food enough for a week right within his grasp. He had but to seize the bird's neck quickly and with the

little strength he had left he could strangle it. The thought called forth all the wild wolf spirit in his nature. He was trembling with the excitement. But as he looked down upon the beautiful smooth white neck of his former pet he wavered. Something within him rose against a deed of violence. He stroked the soft feathers and looked at the creature, who was probably almost as hungry as himself. No, he would commit no horrid act. He would probably starve anyhow and it would be better to die than to have such a conscience. Then all of the beast fell away from him and he felt better.

But while he sat and stroked the great bird his mind was active. The albatross would not remain there long. He would follow some vessel for the beef-fat from her coppers, and as the thought came to him he began a plan to attract attention.

He tore from his shirt a long piece of linen. This was a piece having his name written upon it in indelible ink which had stood the wash of the laundry. It would stand the wash of the sea. He made it fast to the bird's leg and the bight of it he brought up over the back beneath the wings, tying it loosely and leading the other end down so that it could be fastened to the other leg. The thin cloth lying loose would prevent the bird from cutting it with its beak, for the edges of that appendage, while very sharp, were not laid as close together as those of a pair of shears and the thin cloth would work between them. Upon the top of the piece he wrote with his own blood, "Cape Horn, Hermite Isle, Help." Underneath this he put the date and let his laundry mark do for signature. Then he led the bird gently to the edge of the rock and pushed him over.

Afterward he settled down in his bed of tussac and waited for the end he now felt was at hand. He prayed to the God he had felt in the breath of the trade wind and roar of the storm, the power which was manifest in all nature. Then a feeling of peace came upon him and his sufferings were over; he had collapsed.

Two days later the Norwegian bark

"Eric" was working to the westward past Cape St. John. Her captain had noticed a great albatross following his vessel all day and saw the bird had something fast to its leg. Being of a very superstitious nature the master did everything he could to attract the bird's attention and draw him close enough to observe the hanging cloth more thoroughly. He was astonished to find the bird quite tame and had no difficulty in hauling it on deck with a baited hook. He took off the rag and read the inscription, which had luckily kept clear and dry, for the weather had been cold and the sleet squalls had not caused the writing to run.

Being in the neighborhood of the Horn, he did what no one but a very superstitious master would have done without great trepidation. He stood under all sail for Hermite Isle and hove his ship to not three miles from the rocks. The weather was better than usual and he had no difficulty in lowering a small boat and making a landing.

As the craft drew near the land the white life-buoy attracted the helmsman's attention, lying high up on the rocks and showing out strongly against the background of black ledge. The boat was headed into a rift or slue and two of the men managed to spring out of her, the rest keeping her clear of the rocks, which, altho sheltered in the slue, felt the tremendous lift and back-wash of the giant sea outside. The master was found unconscious in his bed of tussac-grass.

By care and skill they managed to get him into the small boat alive and started for the bark that was riding safely in the offing. They hurried back aboard and came alongside just as the Norwegian navigator set the great bird free again. The men rested upon their oars and watched the albatross as it stretched forth its wings and bore away to the southward. A man standing in the lee rigging held a line to throw to the bow oarsman, but he hesitated and watched the majestic flight. The officer in the boat looked instinctively upward and as the huge creature soared away he took off his cap and bowed his head.

WINTHROP, MASS.

The Political Crisis in Hungary: 1903

By E. I. Prime-Stevenson

WHILE in America and Europe the readers of foreign political happenings have been busy with the massacre of Jews in Kisheneff, the riots of excited Kroatians, the assassination of a bad King and a wicked Queen in Bulgaria, the love affairs of an erratic Saxon Princess, the dispersion of religious confraternities in France, the bemuddled Parliamentary politics of Great Britain, and many lesser excitements, there has been played in Hungary a long political drama of bloodless but deep significance to that ever-interesting land and race. It has been a drama to the details and upshot of which Americans, traditionally sympathetic to the free and noble Magyar, will find themselves instinctively responsive. The interest is all the more spontaneous because the name "Kossuth" once again comes into the strongest light of patriotism through the course of the events in question. Hungary and Austria have been shaken to their political hearts. A fierce international fight between the strong Magyar and the weak Austrian has been waged, and now the climax and end has been a fresh humiliation for Vienna and a new instance that Franz-Joseph, Emperor of Austria, is to-day in no position to oppose what must be done or undone by Ferencz-Jossef, King of Hungary, if the nation across the Leitha speaks and acts its will.

The outlines of events which led up to the episode are, briefly, as follows: Only in a few matters that concern the Dual Monarchy practically are Austria and Hungary united to-day. Their arrangements are much like two families who are obliged by force of circumstances to keep on living in the same apartment house, and who have an old joint-interest in certain expenses for domestic affairs. Apart from these matters the two are wholly independent; thoroughly disliking each other; speaking different languages, and with one of the households a home of sickness and decadent vigor—Austria—while the other one, Hungary, is full of health and ardent life. And so

trouble is ever in the air of the establishment. About a year ago the Parliament of Austria decided that there was desirable this year a considerable increase in the recruiting of the joint army. This army is already enormously large and burdensome to the Dual Monarchy. For many reasons special to Hungary, as well as those of general State economics, this idea was viewed with instant and violent hostility across the Leitha. By the press and the politicians the nation was roused to express in every way its dissent to any such new load in the joint housekeeping aforesaid. Now, the Hungarian Parliament, the authoritative voice and mind of the Magyar people, has, like most parliaments, two chief parties, which two, however united in the patriotic watch and ward of their kingdom and land, are of different notions as to how its best and independent welfare is to be preserved. One, the more aristocratic in its aspects, the Liberal, believes in continuing concessions, to a certain extent to Austria; that all points on which from time to time there are disagreements are not equally important or dangerous. It regards Vienna as not aiming to undermine to-day that fabric of Magyar independence which Hungary has solidly built up since 1867, when the Emperor of Austria became crowned as the King of Hungary and took the oath to support its Constitution. At the head of this wider-minded party has been for some years Kálmán von Széll, the Premier. Széll is a brilliant, high natured and patriotic statesman, a shining figure in fact, in all contemporary European political work, the friend of his sovereign as well as the lover of his country. Along with Széll are such notable and historic names in the story of Magyarország as Andrassy, Apponyi, Tisza, Banffy, Podmanicky, Fájervary, and many more. In a sense, to these the methods of the astute Deak, by which Hungary, through knowing of old where to be conciliatory and where to be firm, won her independence, are the methods yet felt to be wise,

if slow. But opposed to this eminently respected and representative element—particularly official and aristocratic, as has been said—is another one, equally respected, equally representative, and, as it now appears, more potent in the national welfare. This is the so-called “National” or “Independence” party. This faction, an enormously popular one, believes in no concessions of any sort that bind Hungary to Austria henceforth; rebuts each thought that subjects the Hungarian to any fresh practical obedience nowadays to Austrian ideas; is made of men convinced that everything and anything from Austria is now either a suspicious or absolutely perilous interest for the Magyar—of men who will “cavil on the ninth part of a hair” and blow up a trumpet in the new moon at each small or great matter emanating from Vienna simply because of its involving a bit of amiable submissiveness to the Austrian mind. To such hearts the only safe principles are those intolerant ones of the leader to liberty in 1848, Louis Kossuth. And the head of this party to-day is that great patriot’s eldest son—Ferencz Kossuth, and with him Ugron, Eotvös, Hollo, Barabas, and so on. Lately the name of Kossuth again becomes more than during a decade one to conjure with in Hungary. Of course within these two opposing ranks in the Parliament at Budapest there are factions and sects and shades. But nothing detracts from the general division of the body as to wide questions. Out of doubt both groups constitute a valuable antagonism and yet coalition for the welfare of Hungary.

Such was the situation, then, when in the winter the Viennese Parliament submitted its new projects and demands to the Transleithan mind. Meantime new causes of argument. For along with the increase of the army, too, was at once seen to be connected—or connectable—two things passionately desired and immediately formulated by the patriot party, always alert to furthering a complete separation of the Hungarian portion of the army. There was demanded a rigid detailing of Hungarian officers to Hungarian regiments; and along with that alarmingly suggestive plan came the demand from Hungary that henceforth

the army orders and general official language of the Hungarian part of the Dual forces should be written and spoken only in Magyarul instead of German. This request was shaped without even considering the propriety or impropriety of the same favor in the cases of regiments of Bohemian, Kroatian, Italian, Polish, and so on derivation, who have always itched for the same sort of inconvenient arrangement. What it means in the event of a flat appeal to arms and races in a political crisis is evident.

So, smarting from the fierce struggle between Vienna and Budapest as to the international tariff, the *Ausgleich*, with commercial irritation only nominally soothed over by a compromise at New Year’s, the Parliament at Budapest came together in mutual hostility, worse after the holidays. The first sessions brewed a tempest. But the after course of arguments has been one to dismay both parties. Ever widening to national sentiments, it has interrupted the whole machinery of legislation; it has given rise to that rare thing in dignified Hungary—real public disorders; it has kept the nation for months in the curious predicament known as an “*Ex Lex*” Status, and after weeks and weeks of painful suspense and incertitude it has not ended in anything less than the fall of a ministry favorable to Austria and the promised withdrawal at Vienna of the unpopular measure most in mind. There is no exaggeration in saying that the crisis has really been the most remarkable and grave one that Hungary has experienced since her virtual independence was granted in 1867. It has been a test of her dominancy over everything in Austro-Hungarian joint housekeeping aforesaid; and she has won.

The scenes that have occurred within the halls of the magnificent Országház at Budapest have been of a sort to outdo description. Their first course, however excited and exciting to the country at large, gave room for that national gift, Magyar oratory—now calm and logical, now fire and flame—of which the outer world has heard at least echoes for centuries, and which is ever ready to make even the hearer ignorant of its music-like tongue spellbound. But

presently, as the contest deepened to embitterment, the Kossuth party borrowed a leaf out of the book of parliamentary tactics in Vienna. There was no use arguing any longer. Obstruction, plain up and down obstruction, to the Liberal party, and especially toward the Premier, von Széll, became the grand policy of the hour and moment. The Parliament of Budapest is not one that will stoop to the vulgarities of the Greek porched beargarden at Vienna. A Hungarian seldom forgets to be a gentleman, even when he is a most excited gentleman. Desk covers were not wrenched off for missiles, along with ink bottles and tables, even if there was a quite Viennese sort of *Krawall* when an unpopular magnate, deputy or crisis came to the front. But the most vehement attacks and defenses, the resort to every petty device that hinders or mars a party movement, the sharpest personal altercations possible under parliamentary rule (and considerably wide outside of such limits), the "speaking against time," and all the rest of such devices have had full play. As for accusations of unpatriotism, of being a traitor to one's land, of playing directly or indirectly into the hands of hated Austrian legislation—why, this of course has been a continual outcry from the independence element. With the usual process by which political differences become personal ones there has come in Budapest and other society the estrangements of lifelong friends, and more than one meeting on the field of honor—which custom is not a sham duel as in France, but a serious matter in Hungary. One of the most notable of such duels was that in which the Minister of National Defense, Baron Féjerváry, the creator of the present superbly organized Magyar militia system, a man far advanced in life, showed all the vigor of his youth in a fierce encounter, that with difficulty was broken off by the seconds. But it is noteworthy that whatever charges of unpatriotism might be thrown wildly about the Országház or the National Casino or the other political clubs, not one intelligent Hungarian has had the idea that the heads of the Governmental party were really a whit less patriotic in spirit on their side than the most rabid Kossuthist. The whole mat-

ter was one of methods and principles and duties, in the individual point of view and in relation to the Crown. In fact, when the upbreking of the ministry was most demanded, when von Széll himself, worn out with his efforts to harmonize the situation, would have gladly resigned, as would others of the then Cabinet, it was observed that no better men, more conscientious and upright and able, however obstinately loyal to the Emperor of Austria as well as to their own King of Hungary, could be brought together for a new Government group.

By this time the state of mind in political Vienna and the distress of the King-Emperor especially can be pictured. The personal affection felt in Hungary for Franz-Joseph is of the warmest sort. That need not be said. But he was the Emperor of Austria; and affection was powerless in this crisis to smooth down either public or parliamentary sentiment. The Court made its usual transfer for the midwinter weeks to Budapest. The wonted dinners, balls and so on were given. But the mood for such superficialities was lost for this year. At the same time came severer public demonstrations in the capital. The like in the larger provincial seats occurred. Some of them in Budapest were hand to hand conflicts between the excited students of the University, and other civilists, with the police. And now came fairly to pass the famous "Ex Lex" situation, by which no taxes were paid. The financial wheels of the country were blocked. For, of course, no good Hungarian could or would pay a filler into the hands of an Austrian-hearted treasury. Passive resistance was a patriotic duty here as in other practicalities, and of it was made the most, right and left.

During all this weary and bitter contest the personality of the Premier, von Széll, assumes a finer and more interesting outline, to the very end. Between two fires day by day, between the upper and the nether millstone night by night of the sessions, bound in honor and conscience to oppose what he believes an unadvisable party resistance to the throne, endeavoring to do his full duty to his King, he has shown some of the

finest traits of a minister. Széll is a man with the warmest sentiments for his own country, a man devoid of personal selfishness or arrogance; and he has been for six months the mark for every sort of Parliamentary interpellation and attack and every sort of national misinterpretation as to motives and judgment. An interesting anecdote is told of the Premier—such no longer, as I write of him—that throws some light on his character. When the retirement of his distinguished forerunner in the ministry embarrassed the King, especially as to a successor, Kálmán von Széll was mentioned particularly. "He is the man—only he!" said the King. "But," said several members of the Austrian group discussing the situation, "von Széll will not accept the office. He cannot; he is not rich, and it will entail on him the loss of half his income to enter on such a charge." "Precisely for that reason am I certain that he will accept the post," answered the Emperor-King, sharply, "for if Széll knows that he can serve his country by a sacrifice he is sure to make it." And now, after being for a year what he lately called himself, "the break-water between two seas, on which every wave from each side dashes itself," Kálmán von Széll returns again to private life, not richer by a florin than what was his diminished fortune soon after beginning his Premiership; but with honor from his countrymen and his sovereign and not an imputation on his loyalty to either.

How greatly such a national situation stirs up in Hungary hostility and suspicion of everything Austrian, of everything Teutonic, can be appreciated best by any one who is in touch with the folk and with their ordinary life under merely ordinary circumstances. Public feeling has run so high that one could not whistle the Austrian hymn without rebuke. One could not wear a cravat that happened to have the colors yellow and black in the pattern. He could not ask a question in German of a soldier or an official without the risk of being insulted. One evening in a theater the writer carelessly asked, in German, of an usher "Please tell me where my seat is?" to be shown the seat, but also informed "Somewhere in *Vienna*, I should say!"

with fine irony. To talk of "the Emperor" was more than ever a delicate (or indelicate) lapse. The national skin was in such a state of sensitiveness and irritation toward anything Teutonic that among the hundred and one absurdly needless interpellations in the Országház one member took notice of the fact that a special series of the Wagnerian music-dramas was being sung in the opera (as so often thitherto), and wished to have such a cyclus censured, inasmuch as Wagner's art is distinctively German. No operas are ever sung in German in the National Opera, of course, but the wary patriot fancied that even as "A Raina Aranyja," there was sedition in "Das Rheingold," and that the man who *has* German music in himself is precisely fit for treason, stratagems and spoils, contrary to Shakespeare's ideas.

Meantime a new and internal complication rose in Hungary itself. For Kroatia (ever under the impression that it is unjustly subjected to Magyar rule and ill treated by Hungary), dreaming of its own political independence and irritated against the Banus, Count Khuen-Hederváry, who is personally unpopular in the province, came into a condition of plain political revolt. Rioting and bloodshed occurred in the handsome capital city, Zágráb. Military law had to be enforced to preserve external order. It may be added that Kroatia is yet far from settled, in spite of the changes in the aspect of Hungarian affairs now, we will hope, inaugurated.

Both parties in Budapest by this time were weary of the struggle. Neither was in the least disposed to give way. But it was felt more and more that the Independence party were likely to be the victors. Public sympathy more and more inclined to Ferencz Kossuth, Ugron, Polonyi, Oloy, Eötvös and Toth and others as really the moral masters of the situation. Everything has depended on whether the unpopular Recruiting Measure as to enlarging the army would be withdrawn from Vienna, however reluctantly, and the Command Question and the Language Question be concurrently yielded. There was no other solution possible; no other way out of the dilemma in sight, be the situation meantime what it might be. Hungary

to-day can defy Austrian parliamentarism without fear. Only one thing is left Austria—conciliation.

And so has the end of the deadlock of this fierce contest of strong Magyar against weak Austrian, of the vigorous Kingdom against the feeble Empire, really resulted. For within about a week the stream for which our political traveler has been delayed seems fordable at last, if one dare not say run by. The Kossuth party have achieved a complete victory. Two weeks ago came the rumors of concessions from Vienna, and that the battle would be given up by the Emperor-King and the Austrian Parliament. Then followed in swift succession the resignations of Széll and Féjerváry—the vain efforts of Tisza to form a new Cabinet—the appointment to the same office of Count Khuen-Hederváry (identical with the Banus of Croatia above referred to and a striking figure in Austro-Hungarian military affairs). To the private *pourparlers* has ensued the definite understanding with Vienna that the objectionable increase of the army from Hungarian sources will not be made, “even if we are still convinced that it is most desirable;” the announcement that the Command Question and the Language Question will also receive satisfactory consideration; the resignation of the old Cabinet, and the formation of one partly new and partly as before. The friendly *rapprochement* between the two Parliamentary parties so long at swords’ points has followed, and the end of the famous “Ex Lex” status for the Transleithan Kingdom. Everybody is drawing a long breath of relief; if not, as to everybody, with satisfaction. Respected by friends and foes alike, even if defeated, and with the thanks of the King for what has been a heroic evidence of loyalty to the Habsburg rule in Hungary, Kálmán von Széll has retired to private life—tho for how long it will be best not to measure now. For that matter, and others, one is by no means yet easy how well-grounded the ford over our parliamentary torrent really is. A few weeks or less will decide.

As for the Kossuth party, its jubilation

can be imagined; and also how much it has risen in dignity and influence. It has never before impressed itself so vigorously on the aristocratic and conservative political mind; perhaps never before now so significantly on the merely public one. It boasts of its work; of having warded off anew a national peril; of being the savior of the Magyar people from an Austrian encroachment; of having carried the country one step nearer to the goal of absolute, unlimited autonomy, of separation in all from Vienna. And it has a claim to be believed beyond a doubt, whether such further advance toward a completely independent national future for Magyarország be safe or not. Certainly the name Kossuth and “The Principles of 1848” are again the talk of the land in their most practical bearings on its relations to the Dual Monarchy. In a manifesto issued last week to the nation Ferencz Kossuth writes thus:

“The Government which undertook to withstand our efforts for our nation has fallen. The theory that we must accept as infallible the merely Parliamentary majority has not held good, because it was not in consonance with the honorable will of the nation. We shall keep on fighting for the full independence of the Hungarian Army, as a body. . . . And while we have hurled back the attack made on us, we have delivered the land from an Ex Lex situation and protected it from a grave material damage. We place ourselves before the nation for its judgment on us, and with clean consciences. The nation can judge us!”

Of the new Premier, Count Khuen-Hederváry, it may be said that he is a man of quite other characteristics, personal and official, than his predecessor, the politic von Széll. “A man of iron and bronze,” he is often termed. That Count Khuen-Hederváry is a popular man officially or in private life can hardly be said—apart from his violent unpopularity as the Banus of Croatia during the recent disturbances in that province. But that is a side interest for him now, from which he has been transferred to this new and more distinguished—if likely not much more restful—responsibility to two nations, to two parliaments and to a sovereign that must needs be two monarchs in one,

LITERATURE

Mr. Allen's Latest Novel

OF all Southern writers Mr. Allen is the least provincial, and, in the broad American sense, most patriotic. Altho the types he portrays are essentially Southern, they are not limited in character or intelligence by sectional pride and prejudice as are most of the people we read about in Southern fiction. The motive of his last novel* is convincing evidence of this admirable difference. While it is a social drama based upon a question of ethics between two lovers, the keynote of the story is to be found in a quotation from "Judge Morris's" conversation with his friend, "Professor Hardage." He had been calling attention to Shakespeare's use of the word "mettle," his love of the thing:

"The word can be seen from afar over the vast territory of his plays like some battle-flag set up in different parts of the field. It is conspicuous in the heroic English plays, and in the Roman and the Greek; it waves alike over comedy and tragedy as a rallying signal to human nature. . . . I love to think of him, a man who had known trouble, writing the words: 'The insuppressible mettle of our spirits.' . . . But this particular phrase—the mettle of the pasture—belongs rather to our century than to his, more to Darwin than to the theater of that time. What most men are thinking of now, if they think at all, is of our earth, a small grass grown planet hung in space. And, unaccountably making his appearance on it, is man, a pasturing animal, deriving his mettle from his pasture. The old question comes newly up to us: Is anything ever added to him? Is anything ever lost to him? Evolution—is it anything more than change? Civilizations—are they anything but the different arrangements of the elements of man's nature with reference to the pre-eminence of some elements and the subsidence of others? . . . Take all the great passions, what old one has been lost? . . . Have you not seen them reappear in the American life in your own generation? I have met them in my office. You may not think I have met Paris and Helen, but I have.

" . . . Then there is the other side, the side of the new. I like to think of what the

pasturing animal has accomplished in our own country. He has new thoughts, he has done things never seen elsewhere or before. But after all, the question remains what is our characteristic mettle? What is the mettle of Americans? . . . I wish to God that some virtue, say the virtue of truthfulness, could be known throughout the world as the unfailing mark of the American—the mettle of his pasture. Not to lie in business, not to lie in love, not to lie in religion—to be honest with one's fellow men, with women, with God—suppose the rest of mankind would agree that this virtue constituted the characteristic of the American! That would be fame for the ages."

Thus would Mr. Allen reduce life as it is in this country to a fine experience, and so energize the passions and pangs of being as to elevate the creature man. But it is doubtful if the illustration of truthfulness furnished by this story measures up to the situation. It is an entirely romantic demonstration of a principle. Rowan, the lover, is rejected by Isabel because a keen sense of honor compels him to confess a sin committed years before. And the author wishes to convey the impression that this is an initial step in the direction of that virtue of fair dealing and truth telling which in time to come will be the *mettle* of the American. And whatever may be said of Mr. Allen's optimism in announcing such a standard for a country that has apparently passed from the primitive stage of veracity and poverty to one of manners and prosperity, it will be seen that his book has an ethical value worthy to become a national inspiration.

But it is not the laying down of a principle that counts for so much in the development of a race as it is the furnishing of men and women capable of illustrating the principle. And so in this tale, it is not the proposition of a braver honesty that will most affect his readers, but it is the people they meet in the course of it as they follow the author up and down the streets of this old Kentucky town, sometimes in the pleasant twilight when he is in a reminiscent mood, and again in the heat of summer mornings when he can talk of nothing but the green and golden earth pasture that has made the

* THE METTLE OF THE PASTURE. By James Lane Allen. New York: The Macmillan Company, \$1.50.

splendid *mettle* of his characters. (If Mr. Allen is a materialist, there is so much spirituality in his dust-theories that we ought not to complain.) There is "Judge Morris," for instance. He is not the hero of the story, but he is the great character in it—an old man wandering out upon the sunlit edge of eternity, who missed in his own life some of the best things, but who kept to the last a mind fitted to the noblest ideals, and a brooding tenderness for all the young world about him. Apparently the author has harvested in this one character all the pathos of loneliness, all the beauty of reflection and all the fine conclusions concerning the riddle of things possible to one who had lived long in the bachelor solitude of his own heart. And there are some notable women in the story. Indeed, no other book of the year contains so many admirable expositions of feminine character. Mr. Allen's observations of the sex include the matrimonial psychology of old maids, the blandishments of young ones, and he makes a just discrimination between the well-bred dullness of the patrician type and the vulgarity of learning in the common sort. And to each he gives the peculiar virtue or vice which is the *mettle* of that individual pasture. This is giving environment much the advantage of poor human nature, but we need not despair so long as he cannot explain why the rose and the cactus ladies grow side by side in his story without contamination.

Still, we wonder how Mr. Allen, a confirmed bachelor, is able to make such an intimate study of the female character as he has done in this book. Shakespeare is said to have interpreted women through his imagination rather than from experience, and this may be the best way. The man in the whirlwind is not in so good a position to observe the pretty madness of its movements as the one who watches it from a safe distance. And once a man is involved in the good or bad illusion women make of life he is never sufficiently impartial correctly to represent the curious phenomenon of feminine existence. But Mr. Allen, unconfused by woman jugglery, makes no mistakes. He keeps a biological as well as a sentimental eye upon the ladies who figure in his romance. He builds up the

character of Isabel with all the perfections of a beautiful and patrician womanhood; and in so doing sets a limit to her charity. She is of a conscious completeness which tolerates no flaw in another, a peculiarity of good women. Their intelligence is fixed, and does not extend so far as compassion for another's frailties.

But if he is successful in portraying the noble woman, he is equally astute in discovering the feline qualities of Isabel's grandmother. This lady betrays traits which, in spite of her age and splendid social position, prove that she belongs to the jungle rather than to a moral order. "Nature is not frank in her characterizations," remarks the author, dryly, after drawing a fascinating picture of the voluptuous old Venus, "lest we remain infants in discernment. She allows foul to appear fair, and bids us become educated in the hearty virtues of insight and prudence."

Meanwhile Rowan Meredith, the hero of the story, is perhaps the least conspicuous figure in it. He stands for a principle rather than for a personality. "He would not lie to a classmate at college, he would not cheat a professor; was it any better to lie silently to and cheat the woman he loved and expected to make the mother of his children?" That was his "mettle," and apparently it was about all there was of him. He is a silent man, who rarely appears upon the scene, who never defends himself, and who finally dies with this comment upon the bravery of his own life, "I am tired of it all. I want rest. Love has been more cruel to me than death."

Any discussion of this author's work that omits an appreciation of his literary style is incomplete. There is more of the *color* of poetry in natural scenery than there is in human experience. But the average writer lacks the imagination to mark off the hexameters of life in visual imagery. With most of them poetic experience is merely spiritual, expressing simply the aspirations of sensation. But in nature we have all the *forms* and *shades* of poetry, from the "emerald twilight of the trees to the dim, white faces of forest flowers that measure the whole earth into stellar spaces when they bloom." Now, it is the power to con-

nect every sensation, every abstract reflection, with the forms and shadows of a beautiful, visible world that marks the charm of Mr. Allen's style. His *thoughts* grow up from the green "pasture" of his "small grass-grown planet." He loves the brave dust from which he and the trees sprung, and he pays tribute to it in a thousand figures of speech that hint more of running brooks and flowery meadows than they do of feverish flesh and blood. Hear him sweep the sleeper back into relation with the things from which he came:

"Among the parts of the day during which man may match the elements of the world within him to the world without—his songs with its sunrise, toil with noontide, prayer with nightfall, slumber with dark—there is one to stir within him the greatest sense of responsibility: the hour of dawn.

"If he awaken then and be alone, he is earliest to enter the silent empty theater of the earth where the human drama is soon to recommence. Not a murmur has stalked forth; not an auditor sits waiting. He himself, as one of the characters in this ancient miracle play of nature, pauses at the point of separation between all that he has enacted and all that he will enact. Yesterday he was in the thick of action. Between then and now lies the night, stretching like a bar of verdure across weary sands. In that verdure he has rested; he has drunk forgetfulness and self-renewal from those deep wells of sleep."

Some may object to the sentimental quality of Mr. Allen's style, but at least it is sentiment based upon a philosophy as deep as nature.

The Coming City

SCIENTIFIC farming has become at last an accepted fact and necessity; so scientific city-making is beginning to be recognized as essential to the development of a higher humanity. The science of modern city-making is formally laid down, as its principles are discovered and its rules enunciated. "Everywhere a desire is present and efforts are put forth to attain the noble and beautiful." Mr. Robinson insists* that all this city development will after a time be reduced to law. It will be a slow and tedious

process of investigation and discovery, but the end will be that we shall clear out of the way chance methods and haphazard building, and the future city will be what it will be because scientifically it better meets the requirements of human life. The spired cathedral marked the aspiration and the ideal of the old time city builders; but squalor all about the cathedral. The new city is characterized by parks and playgrounds, the abolition of filth and the absence of foul smells. It is a democratic movement, rather than aristocratic, that we are working out.

The progress toward a better day for cities, Mr. Robinson thinks, is due to the dreams of a few great men—their hopes, visions and resolves. There is a truth here, that a few men, inspired, may inspire the crowd. It is the best hope of the world. It is possible to hypnotize society into harmony with a good sentiment, if we keep at it, even as we hypnotize an individual into a good habit. The gain in city life is certainly much greater than we can easily estimate. The refuse which now flows in subterranean streams to enrich the suburban fields was formerly poured from upper windows into the street. The streets which glow at midnight like noonday were not so long ago perambulated by individuals with lanterns. Water is almost as free as the air, for public cleanliness as well as private. A good long stride has been made toward getting rid of the mesh of wires that came in with science, and in dissolving the smoke cloud that came with the condensation of industries. The tenement still stays, and probably will stay; but it is a greatly improved tenement, with playgrounds for children near by and civilizing parks not far away. The modern rapid transit has made it possible at least to banish the slum and all that signifies. Better transit facilities will, by and by, get hold of the compacted labor population and distribute it into country homes, as the wealthier classes are already being distributed. Mr. Robinson lays great stress also on the fact that rapid transit may bring the whole population into easy contact with the highest forms of civic taste and art.

Science takes the place of art, how

* MODERN CIVIC ART; OR, THE CITY MADE BEAUTIFUL. By Charles Mulford Robinson. New York: G. P. Putnam's Sons.

ever, in this civilizing process, very largely. Science does not create beauty, but has its own attraction. "Engineering, upon which the esthetic aspect of cities is so largely dependent, differs from pure art in that it need not be the child of inspiration." It is an exact science, and as such wealth can buy it; "bringing to the city the engineer, who can make the municipality splendidly correct, if among its own citizens there be no lover who has that power." The science of city building does not in modern days depend upon high impulse or inspiration; for its plainer yet most essential victories intellect is sufficient. Commerce and industry express themselves not in cathedrals but in great highways, in bridges and wharfs, and stations, and in commercial palaces.

Mr. Robinson does not fail to place emphasis on the fact that the progress which is now taking place involves more than science; it has awakened conscience. Civic art represents a moral as well as intellectual and administrative development. It stands for conscientious officials, for a high public spirit; and where officials are elected it is evidence of an aroused and intelligent populace. We believe the hope of the future depends more largely upon this fact than upon any other. The coming city is to be conscientiously constructed and conscientiously governed. This is the problem which the American people is now working out.

The Anjevin Empire

SIR JAMES RAMSAY'S name is not a new one to historical students. By his four good sized volumes on the "Foundations of England" and "Lancaster and York," he has already given the most complete and accurate survey of the two periods, from B. C. 55 to A. D. 1154 and from A. D. 1399 to 1458. In his present volume* he continues his great work by filling part of the gap between these two periods—that from the accession of Henry II in 1154 to the death of John in 1216.

The method and style are the same

as in the preceding volumes. Sir James, to be sure, gives no rein to his historical imagination, and does not risk picturesque descriptions or sweepingly interesting generalizations. He writes a sober, solid narrative, strictly adhering to the sequence of events; for he believes that "the logic of facts cannot be seen until they are placed in the order in which they happened." He has therefore paid especial attention to chronology, and may be relied on to correct many errors in dates which have crept without verification into the best of books. Furthermore, his narrative is based on wide and careful research—how wide may be seen from the long list of authorities cited in the appendix; and every page of the text, by its constant quotations and references, shows that this list is no empty parade of erudition, but that all the sources enumerated have been judiciously and diligently used.

The facts of the Becket controversy are carefully reviewed, with the result that the rights of the case seem to be more on the side of the King than is usually believed. Becket was not tricked at Clarendon to promise to accept unknown and undefined customs of the realm which were afterward drawn up and presented to him; for, according to Ramsay, the so-called constitutions of Clarendon were drawn up at the beginning of the council and then shown to Becket, so that he knew exactly what they contained before any promise was requested of him.

"The matter of the criminal clerks was but a small portion of the broad question whether England was to be governed by the Archbishop of Canterbury and the Canon Law, or by the King and the national tribunals."

Henry was quick to take up the gauntlet, and, in spite of the revulsion of feeling which followed the Primate's tragic death, the King maintained all except one of the things against which Becket had obstinately fought. The one exception was that appeals to Rome were to be freely allowed.

In military affairs, which fill a large part of this martial age, Sir James is at his best. Probably the chapter on the Battle of Bouvines, illustrated by a reduced copy of a modern French

* THE ANJEVIN EMPIRE; OR, THE THREE REIGNS OF HENRY II, RICHARD I, AND JOHN. A.D. 1154-1216. By Sir James H. Ramsay. New York: The Macmillan Co. \$3.25 net.

Ordnance map and a couple of sketches made on the field itself, will be found one of the most interesting in the book. The reader's attention is called to the "extraordinary exaggeration commonly found in the Chroniclers in their estimates of numbers, whether numbers of men, or money, or anything else. Multiplication by ten might almost be called a normal rate of amplification. Whether dealing with the strength of an army, or the produce of a tax, the student *prima facie* will do well to take one-tenth of any number given if he would arrive at a prudent estimate."

The chapter on Magna Charta, with the Latin original conveniently added, contains an excellent analysis of the leading clauses, and a clear statement of the real historical and constitutional significance of the great document. The value of the book as a work of reference is greatly increased by a good index and black faced topical headings on each page. Every student of English history should have it at his elbow.

The Impeachment of Andrew Johnson.

THE episodes in a nation's history which warrant a book of six hundred and twenty-nine pages* are rare, but there is hardly a page of this work in which the interest lags. It treats of a theme filled with human interest, and involving some constitutional questions of the greatest magnitude. The Presidential element in our political system escaped destruction by a single vote. During the war there had been an enormous concentration of power in the hands of the executive, but at the close of the war there were a series of assaults on the executive power which brought the constitutional center of gravity very near to the revolution point. The impeachment was the furthest bound reached in the legislative oppression, and, as a result, it furnishes a subject of the greatest dramatic interest.

The subject has been ably treated, and with greater impartiality, before, but

never with such literary skill. W. A. Dunning, in his *Essays on Civil War and Reconstruction*, has given the clearest and most impartial summary of the constitutional questions involved. C. E. Chadsey's "Struggle between President Johnson and Congress over Reconstruction" is a scholarly but dry treatment of the same subject; and E. G. Ross—one of the seven Republican Senators whose votes saved Johnson—has given a condensed, partisan account of the trial, preceded by an elaborate effort to show that Johnson's policy of reconstruction was like Lincoln's. Both Mr. Ross and Mr. Dewitt ignore the manifest difference in personality between Lincoln and Johnson. Lincoln could be right without being disagreeable, but Johnson's rectitude impelled him to antagonize Congress; and, as a result, to lose his power over it.

Mr. Dewitt's book is readable to a fault. Any spark of human interest in the course of the debates during impeachment or trial is sufficient to lead the author on a will-o'-the-wisp chase from which he is obliged to return by the aid of some rhetorical *deus ex machinâ*. The story is cleverly managed, and the literary execution more commendable than the historical spirit. The element of human interest is present on every page, while the constitutional controversy is often confused because of the diffuse style. The characterizations are vivid and forceful in a high degree.

The writer cannot resist the temptation to special pleading and sententious comment. When the words which he quotes are sufficient to condemn the speaker, Mr. Dewitt cannot forbear the denouncing epithet or the adjective of vituperation. The spirit in which the book is written will be more readily comprehended by quoting a few phrases of the author's own words.

When in 1875 Johnson was returned to the Senate the author takes occasion to say that, "Great as was his personal triumph, the triumph of his policy was still more significant," and he pictures the results of six years of Congressional reconstruction. The House, which once impeached Johnson, was now Democratic. The two-thirds majority then in the Senate, has now dwindled away.

* THE IMPEACHMENT AND TRIAL OF ANDREW JOHNSON, SEVENTEENTH PRESIDENT OF THE UNITED STATES. A History. By David Miller Dewitt. New York: The Macmillan Company. \$3.00 net.

The "Africanized rotten boroughs," despite the support of the United States Army, have fallen. Soon there was no remaining relic of that "hybrid empire" except South Carolina, "wallowing in the black mire of anarchy and corruption," and Louisiana, misrepresented in the House or Senate by "a stray negro." Everywhere the so-called "rebel element" was in the ascendent, and its denouncers "appalled by the intolerable misery their own plan has entailed." "Naught remains of Congressional reconstruction," the author declares—and thus clearly defines his position—"but unqualified negro suffrage; and that surviving achievement is more and more recognized as a curse to both races, as a stumbling block to good government and a deadly taint to the social order."

In addition to the ordinary sources of information, Mr. Dewitt has been permitted to use the private papers of Johnson and a series of scrap books compiled by one of the President's private secretaries from documents and periodicals of the day. We are obliged, however, to content ourselves with the author's assurance that statements not otherwise authenticated are on the authority of these papers.

Ourselves and the Universe: Studies in Life and Religion. By J. Brierley, B.A. New York: Thomas Whittaker, \$1.40.

Mr. Brierley's book seems to consist mainly of a series of essays or chapters toward the modern confusion of categories. There is a decided tendency nowadays to juggle away disagreeable or inconvenient distinctions by a sort of mental prestidigitation, which begins by confounding mind and matter and usually ends with the identification of evil and good. A dualism of any kind may be a very uncomfortable and unpleasant thing—for some reason it seems particularly abhorrent to present day consciousness; and yet the bankruptcy of German transcendentalism ought to have shown that it is the only safe basis for a substantial philosophy. For this reason we always look with a cast of suspicion upon the kind of thought which seems to depend for its success upon the amount of nebulosity it can spread over surrounding ob-

jects. All cats are gray at night. And while the spiritual is the best we have—while, indeed, it is all that we are really certain of in the long run—its very security depends upon the nicety with which we keep it discriminated from aught else.

Irrigation Institutions. A discussion of the economic and legal questions created by the growth of irrigation agriculture in the West. By Elwood Mead. New York: The Macmillan Co., \$1.25 net.

As soon as the arid region began to be settled it was found that the laws and institutions which had been so successful in the country drained by the Mississippi and its tributaries were entirely inadequate. A family could not independently take up a quarter section and live upon it. To construct a ditch required capital and the centralized control of a large area of land. Then, too, the old common law doctrine of riparian rights, according to which water cannot be taken from a stream for any purpose unless it is returned undiminished in volume and the rivers "continue to flow as they have been wont to do from time immemorial," would, if construed literally, have absolutely prevented irrigation and left the land a desert. Among those who have led the fight against riparian rights and in favor of public control of water Professor Mead has been for many years foremost, and it is not too much to say that he has carried his ideas into effect so successfully that a population of many millions will in the future be controlled by them. In Wyoming, where these ideas have most completely prevailed, the constitution declares that all the natural waters are the property of the State, and that they shall forever remain under public ownership and control.

Sally Wister's Journal: A True Narrative Edited by Albert Cook Myers. Philadelphia: Ferris & Leach, \$2.00.

The important feature of this book is not the Journal kept by a light-hearted Quaker girl who happened to come in contact with a number of gallant officers in the American Army during the Revolutionary War, but it is the elaborate care with which Mr. Albert Cook Myers, the editor, has supplemented the silly gossip

with interesting historical comments and footnote biographies of every man and woman mentioned in the diary. The end of every page is adorned with the genealogy and obituary of some colonial member of families now living in Philadelphia and Germantown, and for this reason the volume will be supplied with interest for this particular locality. But to the world at large the serious enthusiasm with which it has been compiled will seem a little humorous. The editor acknowledges his indebtedness to forty-seven different persons in preparing it, which proves that he would be a valuable historian if he had anything of importance to record.

An Introduction to Protestant Dogmatics. By Dr. P. Lobstein, Professor of Theology in the University of Strassburg. Authorized Translation from the Original French Edition by Arthur Maxson Smith. Published by the Translator. Printed at the University of Chicago Press.

Our thanks are due to Mr. Smith for his translation of Professor Lobstein's *Introduction to Protestant Dogmatics*. Even if we take with some reserve the translator's glowing estimate of the good which the book is sure to do, we may yet be thankful that it has been made accessible to English readers. And this for two reasons, partly because of its subject matter, partly because of its admirable method and spirit. Professor Lobstein's introduction deals with the fundamental questions which underlie modern theological discussion—questions as to the true nature and function of Christian doctrine, and as to the ideal and method of Protestant theology. These questions it isolates from the secondary matter with which they are often confused, and discusses with a simplicity and clearness as rare as they are refreshing. While intended primarily as a contribution to technical theology, and showing the traces everywhere of an exact and wide scholarship, the book will be of interest to the layman as well. It is written in a spirit of reverence and devotion which invites sympathy, and the conclusions to which the author comes, vindicating the place of doctrine in Protestantism, are such as will reassure many who have looked upon the

new theology as wholly destructive. In particular, we know no brief discussion of the problem of religious authority which presents the real question at issue in so clear and satisfying a form. We commend it to all who seek light on this perplexing problem.

The Reflections of a Lonely Man. By A. C. M. Chicago: A. C. McClurg & Co., \$1.00.

This unpretentious little volume, which it seems no long shot to ascribe to Mr. McClurg himself, contains a number of desultory observations written from a very unconventional point of view. Read, for instance, what he has to say in regard to a certain medical compend, "written by a hospital interne, or a physician in the first year of his practice, for the purpose of gaining sufficient prestige to enable him to procure a place on the teaching corps of a medical college"—a case typical nowadays of more professional publications than one. If our guess in regard to the authorship of the *Reflections* is correct, it becomes a little clearer how the writer has been able to dispense with the usual literary hypocrisies and conventionalities which make so much of our current literature a meaningless performance, and to speak the truth occasionally as most of us know it really is, tho we tacitly agree to hold our tongues before the women and children. On the whole the book is an entertaining as well as a frank one, for the writer has sufficient urbanity to make even truth itself inoffensive. And yet we ought to point one caution, which is not perhaps superfluous in this connection. There is a difference between speaking the truth and saying everything that comes into one's head. The latter leads to a sort of flippancy, which is no more than a base imitation of that better quality of urbanity of which we spoke a moment ago.

People of the Whirlpool. By the Author of "The Garden of the Commuter's Wife." New York: The Macmillan Co., \$1.50.

The title of this novel alludes to a colony of New York society people who built suburban residences somewhere in sight from "the garden of the commuter's wife." And thus they brought the evidences of the wicked world and of

their own foolish ambitions under the observations of a lady who had already practiced keeping a diary of her own and now kept one in which she recorded the shortcomings of her rich neighbors. In the columns of the morning paper these would have appeared as items of society news without challenging criticism, but when they come to us shrewdly interpreted by a woman so "comfortably poor" as to be beyond the rim of the "Whirlpool," and so blessed that her gossip invariably leads back to her own husband and children as standards of excellence, the contrast shows that life in the Whirlpool is not only aimless and restless, but pernicious, and this comparison of the normal family life with that of these people, who have somehow lost the sacred home instincts, is the feature of the book which gives it significance. In the city, where the gilded environment is made to fit the mind, the artificial tastes and ambitions of society people are not so noticeable; but in the country they seem monstrous, because nature makes no provision for such types. They are so foreign to her order that even their estheticism is a sort of morbid vulgarity in the presence of her sweet economy in dust and flowers. Their very presence debauches her landscape and gives to her sedate shade an edge of worldly coloring with their Parisian costumes. They trim her hedges and wear the shyest of her woodland blossoms upon the publicity of their evening gowns. Pagans would know better, but, according to the "commuter's wife," these people of the Whirlpool, with the energy of selfishness, become a distinctly new kind of vandals, unspiritually and practically bent upon their own pleasure at the expense of nature and righteousness. As far removed from the world of moral values as good people are from the realm of vice, they cannot feel a rebuke, nor know the revulsion of a healthy repentance. They are spiritually decadent, just as the very poor are physically decadent. And for this reason the significance of this novel will be lost upon their callous, self-contained Newport consciousness. But the book ought to have its influence for good in the disclosure it makes of a dangerous form of social madness. Besides, it is written in a style so delightfully femi-

nine that we hear the swish of the author's petticoats as she whisks from one idea to another, and we catch a fragrant breath from her garden when she opens the attic window to observe the wicked extravagance of her wealthy neighbor.

Round Anvil Rock. By Nancy Huston Banks. New York: The Macmillan Co., \$1.50.

To many persons a second book is the test of a writer; therefore to lovers of *Oldfield*, that quaint and beautiful Kentucky "Cranford," Mrs. Banks's *Round Anvil Rock* will have an added significance. It gives another picture of Kentucky, the Kentucky of 1811, when the battle of Tippecanoe was fought; when an earthquake rent the land; when "Philip Alston, Gentleman," lived and died; when the followers of Catholicism and of Methodism struggled for a footing, and when the personages of this bit of romantic history lived in a wilderness round Anvil Rock. There is always something high bred about Mrs. Banks's people. Good blood runs in their veins, and in those early days there was the same air of good breeding and of good living about them that one would find today. Even William Pressley, selfish and self-centered man that he was, always taking "the softest seat in the best place," never takes that seat when a lady is standing. A marriage has been arranged between him and Ruth, who is the adopted daughter of Philip Alston. No one quite knows who were her parents, but there are dark hints that possibly "Philip Alston, Gentleman," alone knows what befell them. At any rate Ruth is ignorant of the rumors that are whispered about him in the Wilderness. She loves him as a child loves her father, and her love knows no doubt. She is surrounded by the greatest refinement and luxury that love and means can buy, and she accepts these things quite naturally, just as she accepts the love and admiration which have always been hers. For Ruth is beautiful as well as lovable; "hers was such a loving nature that it was as natural for her to love those about her as for a young vine to cling to everything that it touches." And when Paul Colbert, the young physician, comes to the Wilderness, it is quite as it

should be that he and Ruth should fall in love with each other. Persons reading *Round Anvil Rock* will find in it a story full of dramatic incidents, of mystery and of young love, and back of it all an historical setting from the pen of one who knows the history of her own State so thoroughly that she will always be identified with the literary map of Kentucky.

Danish Life in Town and Country. By Jessie Brochner. [Our European Neighbors.] New York: G. P. Putnam's Sons, \$1.20 net.

Herein are entertaining chapters on the Danish people, their Government, social institutions and industries. The author dwells at some length on the racial traits of the Danes. Courage, perseverance, honesty, common sense, an equable temperament, a considerable amount of good nature and helpfulness are ascribed to them. But there is discovered also a lack of "the push, the alertness and the energy for which Englishman and, perhaps still more, Americans are famous." The Dane takes life lightly; he is more easy going than the Englishman or American. Despite his fondness for amusement, he is sober and cautious in his sentiments and enthusiasms. "There is a Danish word which describes with much subtlety the Danish characteristic in this connection—the word *nøgtørn*. Its literal translation is 'sober,' but it means a great deal more than this; it is a blending of diffidence and skepticism, a sort of 'what-is-the-use' feeling." This feeling seems not to stand in the way of a cordial receptivity for new ideas, new methods, new institutions. For, indeed, "modernity" is the present-day ideal in Denmark. The old customs are passing away, the old standards are relaxed, literature and the other arts feel the impress of new ideas, and liberalism and social democracy exert a strong influence on political thought and action. The present Liberal government, which took office in July, 1901, is the first of that complexion in the country. One of the most notable features of the Denmark of to-day is the extent of agricultural co-operation. It is apparently an economic development purely, having no connection with the political move-

ment. It is estimated that 400,000 persons are members of these co-operative bodies, and that the exports of co-operative butter, bacon and eggs alone amount to \$50,000,000 annually.

The Autobiography of a Thief. Recorded by Hutchins Hapgood. New York: Fox, Duffield & Co., \$1.25 net.

The vitality of the picaresque novel from the days of the "Lazarillo de Tormes" down is one of the curiosities of literature, altho just why we who are virtuous should hanker after knowledge of the wicked does not appear mapped out in any philosophy. Mr. Hapgood avows that this biography is written from the confession of a genuine thief, now reformed, and the narrative bears out the assertion. It gives an intimate picture of a rogue's life from his first youthful temptations to his terrible experiences in "stir" and in the madhouse. The story is interesting, tho not always edifying; but would have been better if reduced a full third in length. There is far too much repetition. We recommend those who read the book to compare it with Defoe's "Moll Flanders." The prize of verisimilitude would seem, if anything, to fall to the fanciful work.

Rabbits, Cats, and Cavies. By C. H. Lane. With over 100 Illustrations from Life Studies of Prize Winners. By Rosa Webb. New York: E. P. Dutton & Co., \$4.00 net.

A valuable book for any one interested in raising or exhibiting rabbits, cats or guinea pigs. Full information is given in regard to the desirable points to be bred for; the feeding and care of the animals is explained in detail, and a large amount of general information is added. Those who keep even a single pet of the kind will find the book useful. Anecdotes of various animals are related to lend liveliness to the pages, but it must be confessed that Mr. Lane's knowledge of cats surpasses his skill in language. The English is not good.

Literary Notes

PREMIER BALFOUR has placed Mr. Justin McCarthy on the Civil Lists Pension for £250 for his services to history and literature.

....Thomas Nelson & Sons are now issuing a Teacher's Edition of the American Standard Revised Bible ranging in price from \$2.25 to \$7.75.

...."Leonardo da Vinci," by Dr. Georg Gronau, has been added to the excellent "Popular Library of Art." (E. P. Dutton & Co., 75 cents net.)

....Messrs. Elder and Shepard announce that Mr. Morgan Shepard has retired from the firm, and that the business will be continued under the name of Paul Elder & Co.

....Clinton Scollard, whose verses are well known, has ventured into the realm of fiction. His new novel that is forthcoming through James Pott & Co., is entitled "Count Falcon of the Eyrie."

...."Thoughts from Maeterlinck" is a collection of paragraphs selected and arranged by E. S. S. Maeterlinck lends himself particularly to this sort of anthological treatment, and this volume gives a good idea of his subtle philosophy. (Dodd, Mead & Co., \$1.20 net.)

....The characters drawn by Charles Battell Loomis in "Cheerful Americans" are nothing if not cheerful. The quality of Americanism in them stands out, as it were, in bold relief, and the whole makes easy reading. The illustrations are by Florence Scovel Shinn, Fanny Cory and others. (Henry Holt & Co., New York.)

....For travel reading Macmillan's "Little Novels by Favorite Authors" may be recommended. "Man Overboard," by F. Marion Crawford; "Philosophy Four," by Owen Wister; "Mr. Keegan's Elopement," by Winston Churchill, and "Mrs. Pendleton's Four-in-Hand," by Gertrude Atherton, have already appeared in the series. (Cloth, 50 cents each.)

....In a limited edition of two hundred copies, printed on "Arnold Unbleached," Thackeray's characteristic sketch "Reading a Poem" will be published at an early date by the A. Wessels Company. The sketch was first published in "The Britannia," May, 1841, under the title of "Loose Sketches," which was probably intended to apply to a series of similar tales. It is certain that this characteristic sketch had never been reprinted until its issue in the opuscula of "The Sette of Odd Volumes," London, 1891, which were printed for private distribution. A brief account of "The Sette of Odd Volumes" is given in the Introductory Note of the present edition. The book will be bound in paper boards, and has been printed by "The Wayside Department" of the University Press. A portrait of Thackeray in photogravure as a frontispiece has also been added.

Pebbles

SOUNDER: "What sort of a chap is Bounder?" Rounder: "He wears his eye-glass string over his ear, and is photographed in evening clothes!"—*Brooklyn Life*.

....Now is the time of year when the food and drink scientists insist that the only hope for human kind is to starve to death or die of thirst.—*Cincinnati Inquirer*.

....Here are some answers from a paper handed in by a candidate for admission to the English Church Training College. Question: "What religious instruction have you received?" Answer: "None." Question: "By whom was it given?" Answer: "By the vicar."—*London Times*.

....A. R. Sullivan has petitioned the city to enter the sewer.

Carl Keller, of Waterloo, was here on Sabbath smiling on his best girl.

The Patterson Marble Works has sold two fine monuments to be placed into the cemetery at Williams.

We refused a whisky ad. this week*at good pay.

Rev. Witwer has put one coat of paint on the church.—*Iowa Falls Sentinel*.

"FORKS!" "FORKS!" "FORKS!" THE NEW CEREAL!!!

"Forks" is manufactured in two ways: First, by synthesis of carefully and delicately prepared ingredients of the highest nutritive power; and, second, by putting some other cereal in "Forks" boxes. The second method is better, but more expensive. "Forks" is made in cast iron vats which have been exposed to the weather to obtain a coat of rust. These vats are half filled with sawdust, to which is added first paraffin, rubber cement, lavalac and lard oil, and then a solution of equal parts of Putz Polish and copper filings. The mixture is then boiled, hydrogen sulphide being passed through to remove impurities. As it is cooling, garden hose, chopped very fine, is added. This is a great aid to digestion and is the strongest point in the preparation of "Forks." The cereal is now made palatable by the addition of molasses and peanut butter. "Forks" contains the following nutritious ingredients in the following nutritious proportions:

De-hydrated mineral cellulose.....	37.5 %
Protodextrin	21.5 %
Phosphatic protein maltotose.....	47 %
Dextromaltein	20 %
Flogisticated vegetable chlorofil.....	4 %

Total 130 %

Some Errors of Labor Unions

ERRORS and unfortunate policies that tend to thwart the just aims of organized labor are clearly pointed out by recent events. To those who regard with intelligent and sympathetic interest the efforts of workmen to better their condition by organization these blunders are a cause of keen regret rather than of indignation. The worst of them is the hostile attitude of some unions toward the militia. This hostility has been shown in the State of New York at Schenectady and elsewhere. In many towns of Indiana the enlistment of young men in the National Guard has been retarded or prevented by a boycott. After the Evansville company had defended the jail against a murderous mob, the President of the Central Labor Union asked that the militia should be withdrawn because they were a menace to the public peace. Threats of a boycott caused certain cowardly merchants of Evansville to discharge five employees because they had assisted as members of the militia in the defense of the jail. In Texas the unions have declined to permit members who are also in the militia to take the oath of allegiance required by the new National Militia law. All union men who are members of the militia companies at Austin have been required to resign from the service or submit to exclusion from the labor organizations. It is said that this policy is to be enforced throughout the State. It is reported that union militiamen of Pittsburg who attend the annual encampment this year will be dropped from their organizations.

This is revolt against law and the forces that preserve order. It is the promotion of anarchy. It will tend to confirm in many minds the assertion of Chicago's Chief of Police that the real anarchists in America have joined the unions, and are striving to accomplish their purposes by means of them. Those who thus attack the militia virtually confess by their action that they expect to gain their ends by violence. But they are not a majority of the organized working-

men. We believe that a large majority are loyal citizens desiring to uphold the laws and to maintain order by the agencies lawfully provided for that purpose. Their duty now is to restrain and reform their misguided associates.

Proof that some union officers thrive by blackmail and extortion excites public opinion against the cause which good union men have near at heart. We believe that the great mass of organized labor is free from this stain. But the controversy in New York between the builders and their workmen has brought to light only too much evidence that certain leaders and agents whose action has already deprived their organizations of \$35,000,000 in wages, and who are now making a hopeless fight against a fair plan of arbitration, have been no better than thieves. The disclosures which have led to the indictment of three of these agents, together with the revelations made at the pending trial of the former treasurer of one of the unions, seem to leave no room for doubt as to the guilt of men who singly or in groups appear to have extorted from employing builders hundreds of thousands of dollars, ostensibly as fines, but really as bribes to pay for the exercise of their power over the unions which they were authorized to represent. It is to retain this power, by the exercise of which they have brought foul disgrace upon the cause of organized labor, that they now oppose the arbitration plan which is designed to strip them of it. We do not overlook those who consented to pay the bribes; they should not escape condemnation; but it should be remembered that they were not the authors of the corrupt propositions. The demands were addressed to them, and in some instances failure to comply would have caused great loss and possibly financial ruin.

The unions that have been misrepresented, fooled, robbed and disgraced by agents whom they trusted should make haste to denounce this rascality and to cut loose from everything savoring of corruption. This is the way to deserve and regain the respect of the public.

None of these unions should wait for the public prosecutor or the courts. Every one of them should make an inquiry of its own, ascertain the facts and punish promptly wherever treachery and guilt are disclosed. We believe that in these organizations there are very few who are willing to countenance extortion and blackmail. The honesty of the large majority of their members should be shown conclusively to the public.

We do not desire to prejudge the case of Miller, the assistant foreman of the bindery in the Government Printing Office. All the evidence is not yet accessible. He was wrongfully removed, for the sole reason given was that he had been expelled by his union. The President was perfectly right, of course, in ordering that he be reinstated, and in saying:

"There is no objection to the employees of the Government Printing Office constituting themselves into a union if they so desire; but no rules or resolutions of that union can be permitted to override the laws of the United States, which it is my sworn duty to enforce."

It may appear hereafter that Miller was guilty of offenses that would require his removal for the good of the public service; but such evidence as is now available tends to show that he was expelled from the union because he objected to an arbitrary restriction of the quantity of work each member should do, and also for the reason that he had given to members of Congress information that could be used in reducing expenses and making reforms. The proof (taken from the union's formal charges against him) seems clear that he was attacked for urging members "to do 14 books per day, knowing that they had been instructed by the union not to exceed 10 books per day." This union's rules forbid its members to work in association with a non-union man. Public opinion will not approve the enforcement of such rules in the Government service; nor will it sanction an arbitrary restriction of work output which prevents reasonable reduction of cost, least of all in this great Printing Office, from which union influence has thus far been able to exclude labor-saving devices, such as type-setting machines, that are in common use all over the world. Organized labor would suf-

fer some loss of public sympathy if the International Brotherhood of Bookbinders should act unwisely with respect to this case in Washington.

Long Distance Education

THE improvement in the facilities of communication is having a remarkable effect in extending the power of the teacher over an area and to numbers formerly thought impossible. Once the professor came in contact only with the few students gathered in his class room, now he lectures to several hundred at a time, and may by correspondence direct the work of several thousands, whom he has never seen. The other day a young civil engineer, flood-bound in St. Louis, was given an oral examination for his degree by the graduate committee of professors sitting in Chicago. The long distance telephone was the medium of communication, but the dispatch does not state whether, according to the usual etiquette on such occasions, the full scholastic dress was worn by the candidate and his examiners. So far the use of the telephone for educational purposes is unusual, but instruction by correspondence is carried on more extensively and successfully than is realized by most people. Beginning, in this country, as one of the numerous ramifications of the "Chatauqua idea," it is now admitted to some extent into the work of nearly all colleges, while commercial enterprises of various sorts are using the scheme for all it is worth to them. For a few postage stamps and a fee you can learn how to develop your negatives or your biceps, how to make your own dresses and complexion, how to keep your liver and your astral form in a state of healthful activity, and for the accomplishment of these tasks to the satisfaction of "the professors" in charge you may receive, for another fee, a diploma which is an ornament to the walls of any apartment.

In some technological lines, however, a success has been attained, particularly by means of lessons and textbooks, giving the kind of instruction needed by mechanic and workingmen

to qualify them for specific positions in the ranks above them. Many of the instruction sheets and hand-books sent out by such institutions as the Scranton schools are so clear and practical in their style and wording that instructors in colleges of the traditional form may well profit by their study. Recently the Armour Institute of Technology has taken to advertising its correspondence work in a way quite outside academic traditions, and last month held a reunion—if that word can be applied to those who have never met in person—of such of its correspondence students as could attend. They have several thousand students, ranging from seventeen to seventy in age, and from China to Peru in space, and they claim excellent work can be done in this way. This agrees with the experience of the University of Chicago, which has made correspondence work an important feature in many of its departments. President Harper goes so far as to say that:

"The work done by correspondence is even better than that done in the class rooms. Students who come to us after a year of such work are better prepared than those who have taken it with us in the class rooms. The correspondence student does all the work himself; he does it in writing, and does twenty times as much reciting as he would in a class of twenty people. He works out the difficulties by himself, and the results stay by him."

The disadvantages of nonresident study are many and manifest; such as the lack of libraries, laboratories and museums, of personal contact with great men and of familiar intercourse with fellow students. The man who studies and works at the same time can give only the fag ends of his time and mental strength to books, and at the same time is handicapped in his daily work by competition with those who "mean business" and nothing else. On account of these impediments study out of school can never be so effective as study in school, and that it actually accomplishes as much as it does must be because in certain kinds of work and with certain individuals the method has advantages of its own. One of these is that the young man who is studying in the same line as his work gets his knowledge, like his daily

bread, when he can make best use of it. Consequently it is better assimilated than if he had acquired at one time a larger mass of information, and stored it up, more or less securely, for future use. We get more information from a dictionary when we look up a single word we want than when we read a page at a time. Every teacher knows that the best students are not those who take the study because it is prescribed, nor yet those who take it for the love of it, but those who, whether they like it or not, feel that they need it and must have it. That is why it often happens that a student who has been out a year in practical life does better work after his return than before he left. The student who is always asking why he should take this or that subject is an annoyance to his instructor, but he is not always the poorest in the class, nevertheless.

The function of the student in college is necessarily absorption, rather than production. He is preparing, not accomplishing. Of course teachers correct as far as they can this one-sidedness of the educational process by requiring the students to do something, even tho it is of an artificial and nonproductive character. Our elementary laboratories are imitation workshops, just as our gymnasiums are substitutes for the useful physical labor of which the students are deprived. Since the natural reward of work, which is the satisfaction of accomplishing something, is lacking in the schools, artificial aims and stimuli have to be contrived to take their place, and we have the extensive scholastic paraphernalia of grades, degrees, prizes, ranks and honors existing largely for this purpose. Now in school, as out, there are minds which are prone to mistake the symbol for the reality, and to think that they are doing something when they are merely preparing to do something. In practical life only results count, but in the school the emphasis is necessarily laid on methods rather than results, so some students, as even some professors, come to consider methods as results, and graduate with the disease of chronic receptivity and motor incapacity, which it requires some years of rough knocks in "the world" to cure. The colleges exert too little influence over the life and

thought of the people, and they could, with advantage on both sides, touch a wider public than they do. It is their duty, then, to determine how this may be done without lowering the tone inside the colleges or neglecting their primary duty toward their resident students. If the people cannot get doctors they will take quacks. It is a mistake to look, as some do, upon correspondence teaching, university extension and the like as merely a dissipation, a degradation and a dilution of knowledge. It is more correct to see in the movement an opportunity for the college spirit to do more toward shaping our national ideals than has been thought possible hitherto.

Infant Summer Mortality

Not long ago the official weekly report of the Chicago Board of Health announced that the infant mortality in that city had decreased many thousands each year during the last ten years. As the result of this decrease in infant mortality the head of the Health Department felt himself in position to proclaim with confidence that while much still remained to be done for the sanitary improvement of the conditions of infant life, especially in the crowded quarters where live the poor, there is amply sufficient data for the prophecy that notwithstanding the increase in the population of Chicago there will be fewer little graves by many thousands in the cemeteries of Chicago as a consequence of the hot weather of 1903 than there were for the summer of 1895. There has evidently then been a very great improvement in the matter of realizing the dangers, securing the enforcement of hygienic precautions and making life more possible even for very delicate children.

This improvement has been the result of general amelioration of living conditions and the recognition of special dangers. At the end of last summer, however, there came the announcement of a discovery that promises to do more for the reduction of infant mortality in our large cities during hot weather than all that has been accomplished during the present time by physicians, sanitarians and philanthropists. Two young medical men, working at the problem

of the etiology of cholera infantum, the well recognized and worst form of summer diarrhea in children, reported that they had found in 42 cases of the summer diarrhea of infants in the city of Baltimore the bacillus of Shiga. This bacillus, called after its discoverer, a distinguished Japanese investigator in bacteriology, who found it to be the cause of tropical dysentery as it exists in Japan and in most of the Orient, has been hitherto considered not to be an inhabitant of the United States. There is no doubt, however, that the bacillus isolated by the two young Americans, Doctors Duval and Bassett, was really the bacillus of Shiga. Not only were its morphology and cultural characteristics the same as the bacillus isolated by the Japanese investigator, but it stood even more trying tests that showed its true character.

Some of the most important parts of our knowledge of the bacillus of Shiga, or bacillus dysentericus, as it is sometimes called, are due to Professor Flexner's investigations of the disease in the Philippines. Professor Flexner, who has since become the head of the Rockefeller Institute for Medical Research in New York, was asked by the United States War Department to go to Manila to investigate the epidemic of dysentery which was raging there. He found that it was due to Shiga's bacillus, and found also that the serum of patients suffering from this form of epidemic dysentery always causes a visible agglutination of the bacilli of the disease when brought in contact with them on a microscopic slide under conditions in which the clumping process may readily be recognized. This same phenomenon, the clumping of the bacilli by the serum of a patient suffering from disease due to the specific bacteria experimented with, was found to be true by Widal with regard to typhoid fever several years before Flexner's discovery, and this peculiar manifestation was suggested and is now generally used as a means of recognizing the presence of typhoid fever when there is doubt about the diagnosis. Professor Flexner suggested that the serum of patients suffering from dysentery might be used in the same way with cultures of Shiga's bacillus for the diagnosis of doubtful cases of dysentery where the existence of an epidemic of

the disease had not yet been recognized.

Doctors Duval and Bassett found that the blood of infants suffering from the severer forms of summer diarrhea did cause agglutination of the bacilli in cultures of Shiga's bacillus and besides this bacillus was isolated from their intestinal evacuation. The same bacillus was not found in the evacuations of healthy infants nor in the suffering from milder and presumably simpler forms of diarrhea, nor did the blood of these latter infants cause any agglutination in cultures of Shiga's bacillus. There seems no room for doubt then that cholera infantum, for so many years presumed to be due to the special intestinal condition set up by prolonged and intense heat, is really the epidemic dysentery of the Asiatic coast. This is not so surprising when we recall that Professor Flexner succeeded in demonstrating the presence of Shiga's bacillus in certain epidemics of dysentery which took place in inland jails and other institutions in various parts of this country. This bacillus, groundlessly presumed to have its habitat in the Orient, is present in many parts of the world, and only awaits a favorable opportunity to reach a condition of virulent development.

This discovery accounts for many peculiarities of the intense forms of summer diarrhea in children, which have hitherto not been easy to explain. The contagious nature of this disease has long been suspected. Professor Escherich, the holder of the chair of children's diseases in the Austrian University of Gratz, who is acknowledged to be one of the most distinguished authorities on the subject in the world, stated very definitely some years ago that true cholera infantum was contagious and might readily be carried, even by physicians, from one infant patient to another. This fact had been borne in upon him with special emphasis by a personal experience in which he felt sure that he had himself been the agent to carry the contagious material to his own child. There seems no doubt then that the greatest care and the nicest precautions of cleanliness will have to be exercised in order to prevent the spread of the disease whenever it occurs. In crowded districts, as far as possible, all visiting among families in which the disease oc-

curs will have to be forbidden to neighbors who themselves have little children in their families. Practically as careful precautions will have to be taken in this matter as with regard to tropical dysentery when it occurs in camps or in hospitals.

The outlook as regards the treatment of the disease is not nearly so discouraging as it has been in the past. As a rule cholera infantum is of fulminant character and carries off its little victims almost before anything can be done for them. Professor Flexner, in his researches with regard to Asiatic cholera, showed that it was possible to prepare an antidysenteric serum somewhat in the same way in which diphtheria serum is prepared, and that this antitoxin proved quite as helpful in cases of dysentery as does diphtheria antitoxin in that disease. It seems not unlikely that the demonstration of the therapeutic efficaciousness of this serum will be made this summer and the prospect is therefore interestingly hopeful. Tropical dysentery has since the discovery of its bacillus been made much less dangerous by the enforcement of proper quarantine with regard to the disease. Corresponding measures will doubtless prove quite as effective with regard to cholera infantum, while the new serum will be of service in the cure of such scattered cases as may occur, thus lessening the danger of the epidemic spread of the disease.

A Timely Word to Idealists

JUDGE LE BARON B. COLT, of the United States Circuit Court, is a brother of the millionaire gun and revolver maker, Colonel S. P. Colt, whose gleaming products are esteemed wherever the joy of manslaughter is known. Colonel Colt gave a fine dinner at the famous Squantum Club in Rhode Island the other night, and the Judge made an address on the labor question which the newspapers say is "attracting wide attention." We are glad if it is. Altho its theme is economic, it is worthy to rank with the best productions of pietistic literature.

The modern organization of industry Judge Colt accepts with smiling equanimity as "a part of the law of our industrial growth." We suspect that this

phrasing is a reporter's improvement upon his Honor's English, but it conveys an idea which all readers of pietistic writings will recognize. It justifies the ways of God to man in the jargon of the day, which at present is not Miltonesque. Whatever is born of natural law must of course be accepted by positive law, and Judge Colt sees that "the syndicate" must have recognition in statutes and decisions, like any other of the "new conditions which continually arise in the history of a people." This recognition, we infer, will handsomely round out our legal system because, as the Judge continues, "we have now imbedded in our laws all the personal rights known. We have built up the most perfect form of government ever devised, a composite Federal Union, combining the liberty of a small State with the strength of a mighty empire."

All this ought to make a people happy; yet, strange to say, some millions of our fellow citizens are not altogether content with their lot. They agitate and denounce. They take part in great strikes which diminish the profits of millionaires, and consort with the unholy gods of Bryanism. Judge Colt has his kindly paternal words for these misguided ones. "There is no more loyal body of men," he says, "than the wage earners of this country. But in their aspirations to some extent they are idealists. They are striving not only for equality before the law, but for equality of economic conditions." This gentle reproach we fear is deserved. This is a practical age, and idealists are in danger of being classed with free traders and reminiscent gentlemen who still read the Declaration of Independence. It is true that a touch of idealism went into the making of "the most perfect form of government ever devised," but that was a long while ago. In the practical administration of the system our politicians and law makers have been careful not to carry idealism too far. Equality before the law was contemplated by the framers of the Constitution, but it seems that this is one of the objects that workingmen are now striving for; whence it would appear that courts have tempered the ideal with judicious discrimination.

In view of the somewhat exaggerated

hopes raised by the fathers, however, an idealistic demand for equality before the law may, we think, be pardoned in the sons; but the desire for economic equality is obviously unbusinesslike. "There are great natural laws which society cannot overcome—namely, that men are born with unequal energy and ability, and that wealth is founded upon labor and sacrifice. We may alleviate the situation, we may better the condition of labor, and organization is very helpful to this end, but we cannot cure inequality of economic conditions." Humility is a trait of all great thinkers, and Judge Colt's unquestioning acceptance of the predestined order of the world—which gives to him who hath a million or two to start with, and takes from the impecunious the margin he seemeth to have—marks him as a man of unassuming faith. Patent rights which confer monopoly privileges upon manufacturers with capital enough to buy them belong to a providential scheme of things. Franchises are as much a part of the cosmic order as gravitation is, and the bribing of legislatures proceeds according to natural law. Workingmen who would do away with these causes of economic inequality are not intentionally irreverent, but they fail to understand the universe.

Such a disposition and control of economic opportunities by the public as would create approximate economic equality among men would be justice. Justice savors of idealism, and it is most interesting to discover that a Judge of the United States Circuit Court looks for an amelioration of social conditions to quite other means. No one better understands the limitations of law and government, regarded as instrumentalities for creating justice, than the men who try to administer them. The lot of the workingman will be improved, as Judge Colt perceives, not by the establishment of justice, but by "that spirit of divine charity which the men we all know are showing by giving back to humanity the fruits of the talent they derived from God." Reverent spirits in all ages, after exploiting "humanity" with success, have given back to that long-suffering entity a portion of their gains. This, too, is a natural law, and on every hand we see our millionaires obeying it. The talents

which count to-day are those which enlist the friendly co-operation of law makers and judges in working "humanity" by the most improved modern methods. The share of their fruits to be given back should be relatively large. It is inspiring to find in the discourse of an eminent jurist so clear a perception of the natural order of the practical world, and so cheerful an acceptance of the unidealistic inevitable.

The Problem of Waste

PROFESSOR MARSHALL, the English economist, estimates that the British working classes spend every year not less than "\$500,000,000 for things that do nothing to make them either happier or nobler." The President of the British Association, in a recent address, before the economic section, confirmed these estimates; and avowed his belief that the sum named above was wasted in food alone. Professor Matthews adds that so large a proportion of our housekeepers are brought up in town life and factory life that they do not know how to buy economically, while the cooking art has necessarily gone into decadence. He estimates the waste in the United States from bad cooking alone to be at least \$1,000,000 every year. This estimate, of course, is not sufficiently accurate to be of statistical value; but it is of use in calling attention to the fact that an enormous sum is being lost in household management. Professor Gorby, speaking of our fuel waste, says that in Indiana alone the loss from natural gas has been 100,000,000 of cubic feet daily—that is, \$10,000 in cash. This makes the loss in that fuel since it first came into use not less than \$25,000,000. Forty per cent. of all gas taken by consumers is a dead waste. This profligacy has hastened the exhaustion of our gas fields; to keep pace with our forests. The annihilation of ninety-seven per cent. of our magnificent forest trees, in a single century of national life, is something unparalleled in the history of extravagance, and is amazing to even our own half-awakened sense of obligation to the future.

In the *Fortnightly Review*, a writer says of the English people, "Do any of

us deny ourselves a single scuttle of coals so as to make the coal fields last another hundred years?" It is this question of waste which is just now becoming of immense importance to us, in connection with the possible exhaustion of coal. The American people are the slowest of all in the world to be awakened to a sentiment of economy. Our vast resources, in proportion to our population, have deadened us to the conviction that we could ever exhaust our fuel. We have been at work for one hundred years, to answer Mr. Malthus, that we can make our food products increase as fast as the demands of an increasing population. The problem is fairly well settled that there is no danger for some centuries to come on that point. We are now suddenly confronted with a problem not so sure to be solved without a setback to industrial fields, to keep pace with our forests, with reckless haste, and we have burned our coal without forecasting the future. Our forests, our oil wells, our natural gas, our coal beds have all been used with lack of economy; until in every direction we are compelled to answer the question, Are we to be without fuel sufficient for the increased demands of industrial expansion?

A recent writer, whose opinions are of especial weight in agricultural affairs, says: "We waste enough on our farms to support, in comfort, half as many millions more as this country now contains." It is not an exaggeration to say that at the present time we are growing on our farms twice as much food products as is consumed. It can be made apparent to any careful observer that "from beginning to end of each season, the orchard waste in our rural sections is not less than fifty per cent. of that which should be turned over to the great body of consumers." If this be even approximately true, and true it probably is, it is startling enough to lead American farmers to a close consideration of the facts. The same writer tells us that a merely superficial consideration of the fruit culture of America will show that in the competition with insects, in ignorant cultivation, in careless handling, and in lack of proper storage, altogether there is a loss that would enrich the farmers of the United States, while it inured greatly to the advantage of consumers.

In a report made by Professor Jenks on road legislation, he tells us that a full load can be carried on our common roads only three months of the year; two-thirds of a load for three months more; and for the other six months only half a load. Defective highways cost the State of Illinois \$15,000,000 annually for hauling, and depreciate the value of farms \$160,000,000. It costs a farmer \$1 to haul one hundred bushels of wheat one mile on dirt roads, while by macadamizing the cost is reduced twenty cents a mile, and the value of the wheat is raised proportionally. There is probably no question that now comes before the American people—after the fuel problem—more important than the question of improved highways. It is true that the trolley is compensating very largely for poor roads; but it will be many years before the bulk of our farm products will not have to be hauled over roads which at the present time, and with present care, are sloughs half of the year.

Professor Marshall, in another of his estimates, tells us that food, as now provided, "costs as much as clothing, hired help, rent (if any), and all the other necessities of life." While this statement is incorrect as applied to some families, it is probably not far from accurate as applied to the whole population. The farmer hides this expense largely in the fact that he produces nearly all that he consumes. He rarely has any means for calculating what his income would be if household consumption were turned into sales and profit.

An intelligent butcher was recently asked to whom he sold his costliest meats. He replied, "I'd make little profit but for people that ought to be more economical; the poor buy with less care than the rich." When asked if, in his judgment, this was why some people were well-to-do and others poor, he replied: "You'd be surprised to know how many swell dinners there are in the poorest hovels. They will have the choicest cuts I tell you." Mr. Merriwether quotes the case of a coal laborer whose meat bills were \$156 a year. The clothing of his family cost \$108 a year, while they occupied a very close tenement, devoid of all reasonable conveniences. Professor Attwater says, "When the day laborer

buys his bread at seven and a half cents a pound the actual nutritive material costs him three times as much as it does his employer, who buys it in flour at \$6 a barrel." The poor rarely buy at wholesale, but pay the retailer's profit; but when they sell it is at the wholesaler's price, and at the lowest market scale. Buying at wholesale is something foreign to the majority of American families. We support a vast number of middlemen who could be easily dispensed with in our domestic economy.

Poverty in so young a nation as ours should hardly be known. Food enough there is, or may be, for five or six times our present population, without an increase of cultivated lands or of cultivating forces. We have to learn the economy of production, the economy of distribution and the economy of consumption. These economic studies should be carried into our schools, preparatory to their application to our homes and our farms. Our present system, where it touches economics at all, lacks that scientific precision which would bring our people to an intelligent appreciation of value. Without dropping into the folly that economy is a method of saving meat scraps and bread crusts, we need to cultivate a sentiment that will take pride and pleasure in making the largest contribution to the comfort of the largest number of people.

The Country in the City

THE INDEPENDENT has not tired in its enthusiasms for what may be called suburbanism—that is, for the larger distribution of our city population throughout the country, and the creation of a more wholesome relation of human beings to nature. We have taken full cognizance of the tide countryward, and have done much to encourage it. We are glad to note that correlative to this movement has risen a determination to make the city itself more open, more wholesome and more park like—to break up its congested conditions and make them impossible. It is difficult to put in form what has been done, so that it can be easily seen at a glance. The work is one of enormous detail, and it will take many years yet to abolish the old city

and create the new. There is no quick panacea for ugliness. Aristotle defined a city as a place where men could live a common life for a noble end. This is the object of the numerous city improvement associations that now number several hundred.

It is, of course, true that a city must largely be a growth of nature, almost as much so as a tree; yet, like a tree, it may in all cases involve elements of beauty and develop the beautiful. Brussels is one of the most attractive cities in the world, but owes nothing to physical nature. Washington might have grown along the river front, as was expected, but it has done far better under the control of wise engineers. Robinson says that it is very rare that nature has been able to establish the character of a city by topography; only in the case of Edinburgh, Venice, Naples and a part of New York City. New York should have been the most beautiful city in the world.

The most important work to be done in the way of city improvement is to throw it open to sunlight and air; to break up its tendencies to congested circulation; to create parks, drives, play grounds and shaded retreats. Quite as important as the park system is the laying out of small squares, triangles, circles, etc., everywhere about the city, where a few trees can be grown, a little shade created, a fountain of fresh water placed and seats for the tired pedestrians. The subject of playgrounds is equally important. The London Metropolitan Garden Association has laid out over one hundred playgrounds and gardens, including one hundred and twenty-five acres. This is held to be a part of the educational force of the city. In New York the Outdoor Recreation League is doing excellent work in the same direction. It must be remembered constantly that we are not to work any longer on the Paris ideal of creating a beautiful city, but of countrifying the city. What we want to do is to bring inside just as much of light and nature life as possible. It is not impossible to make the birds at home with us; and any part of the city where they cannot be at home is unnatural and abnormal.

The tree question is of supreme im-

portance, because the country is identified primarily with its vegetation. No part of a city should be so built as to exclude shade. More important is that function of trees which absorbs the carbon gases and purifies the atmosphere. In the city of Washington there are eighty thousand trees, and these are not at the mercy of a political organization. They are cared for by a special city commission. Every city in the United States should have a Park Commission. This commission should consist of the best educated foresters and tree lovers who can be secured. Paris contains one hundred thousand trees and spends \$60,000 a year on their care. Her streets are over sixty-five feet wide, and lined with double rows of trees, while the broader thoroughfares have a tree planted strip down the middle. The only criticism needed is that the esthetic rather than the natural is always predominant.

Realizing the difficulty which besets the effort to countrify the city, our Government has sent out bulletins to advise in the selecting of varieties of trees best adapted to city growth, for it is true that many of our common trees refuse to grow in smoke and gas poisoned atmospheres. The question arises whether human beings can really thrive where trees cannot. The probability is that under such conditions the struggle for existence must necessarily develop degeneracy. President Eliot does not consider a park system of value apart from its relation to the evolution of people. He wants our cities to be so constructed that the people will live more largely out of doors—eating and drinking, as well as playing, in the parks. Metropolitan Forest Reservations, around Boston, are already used in this way. Thousands of persons resort to the larger parks in vehicles drawn by horses. "One often comes on a family group, which has gone down a side path and established itself under some familiar tree." He would have all our park systems include separate and special places for these little outdoor dining parties. Children brought up in the country are educated largely by their rural surroundings. So far as possible, this tutorship of nature should not be taken

away from city children. Our public schools should spend a part of their time out of doors, studying in the parks. "Even a city square, in which a large part of the area is gravel, may be made to illustrate to the children of the neighboring schools some of the most charming of natural phenomena."

Under the head of Garden City Movement, London has developed an organization whose purpose is to obtain tracts of land in the outskirts or in the near neighborhood of larger cities, where industrialists can be gathered in a co-operative way. This new sort of city is not to grow up haphazard, but to develop on a plan, which itself must follow the experience of the past. This London company projects not only the inclusion of a considerable agricultural area, but the rigid insistence upon sanitary building. There should be no possible chance left for the creation of slum neighborhoods. It is intended that profit-sharing shall be adopted, if possible, in the business enterprises. But the peculiar feature of this movement is the unification, in one co-operative effort, of agriculture, manufacturing and artisan work. The older city shuts out agriculture; the new city includes it.

We, of course, cannot overlook the influence along this line of the potato patch experiment, originated by Mayor Pingree, of Detroit. This movement has now spread into most of our larger cities. It was intended originally to alleviate the pressure of poverty, but has grown to be a feature of municipal evolution, and shows no abatement. The sixth annual report of the Philadelphia Association shows that, from a small beginning in 1897 of twenty-seven acres, the scheme has advanced to include a cultivation of 198 acres, while the beneficiaries have increased from 528 to 3,775. The production of marketable products for 1892 was estimated to be worth \$50,000; 2,608 quarter lots were cultivated, and the beneficiaries received on an average \$54 each.

The chief problem all the time is, in what way to get rid of overpacking population; and how to keep in the frankest relations with nature. In other words, the city as it now exists

must be abolished; the city of the future must be one in which agriculture shall be allowed to co-operate on equal terms with manufacturing and commerce. Heretofore agriculture has been given over to the country, while the factory constructed and occupied the cities. Now agriculture begins to invade the city, while the city moves out to meet and congratulate agriculture. That occupation of man which marks the latest and highest advances of civilization comes to a splendid renaissance. Understand that the ideal that we represent is not that of an artistic whole; the object is not only to make an esthetic and convenient city, but to leave the city so far as possible in the hands of nature.

The Coming Together of Nations

THE growing friendship between those ancient enemies, France and England, is certainly one of the most important doings of the day, and we give in another column an account of an event unique in history, the visit of the representatives of one nation to the representatives of another nation to devise a plan to make the peace which now exists between them permanent and secure. The time is well chosen. Racial animosities are ameliorated, and it was generally remarked that during the recent visits of King Edward to France and President Loubet to England the public rejoicing exhibited on both sides of the Channel was not of the purely perfunctory character, but represented a genuine feeling of pleasure on the part of the people at this manifestation of official friendship between the Governments. There was much talk of an alliance between France and England, but while this is visionary, there is hope for something better, the formulation of some plan of arbitration, which shall be another thread in the network which is now being woven for the drawing together of all nations.

The last alliance between France and England led to the Crimean war, one of the most bloody and useless wars in human history. We want to see no more alliances of that kind. In

the past alliances for war have been the rule, let us do what we can to see that alliances for peace are the kind to make in the future. The French and English legislators should not neglect this opportunity, but should use their utmost endeavors to get established some definite and practical measures, however small they may be. Our international morality is some five hundred years behind our average private morality, yet peace among nations is no more impracticable than peace among individuals, such as now prevails and is recognized as normal and proper. The occasions on which a man needs to carry a revolver nowadays are extremely rare. He does not carry it around in his pocket and take it out to show people how bright it is and how skillfully he can use it. There may come a time when the parade of navies will be regarded as equally bad form in the etiquette of the world. We have no hope that in this generation people will stop killing each other, either individually or *en masse*, but dreams of the federation of the world are worth dreaming, and who knows but that some of these dream-illusions may, as psychologists say they do, remain in our minds when we awake to everyday conditions, and influence our conduct in practical affairs.

The Great Work of Mr. Holls

If there had been no American delegation to the Peace Conference at The Hague it is almost certain that the Hague Court would not now be in existence. If Frederick W. Holls, who died at his home in Yonkers, N. Y., last week, had not been a member of the American delegation it is quite certain that his American *confrères* would not have bothered much about the "impracticable" question of universal international arbitration. In other words, if any man is to be credited with the creation of the Hague Court that man is Mr. Holls. Not only did he engineer his cause with consummate energy and diplomacy on the floor of the Conference, but he even induced Germany, who all along held out against the organization of the Court and was the chief obstacle to its inception, to change her mind and

sign the peace treaty. Ever afterward Mr. Holls felt an especial interest in what was largely his creation, and it was he who persuaded Mr. Carnegie to give the money for the erection of the Palace of Peace at The Hague. We shall not speak of Mr. Holls as a lawyer, a philanthropist, a politician and an author. The talents he employed in these directions he freely gave to the service of his fellow men. This, however, must not be forgotten: that all the disarmament propositions of the Peace Conference failed, and as disarmament was the original and chief topic which the Czar suggested for discussion, the whole Conference would have accomplished nothing had not international arbitration come to the front. Credit for the success of the Conference in promoting arbitration was mainly due to Frederick W. Holls.

A New Source of Energy

The mystery of radium remains unsolved and no one has yet been able to ascertain where it gets the energy which it continuously radiates as heat, light and rays of such astonishing penetrating power. When King Edward and Queen Alexandra visited the London Hospital recently a pile of six pennies was placed on top of a minute piece of radium and the light was visible through the coins. It has been calculated that if there is 3.6 grams of radium in each cubic meter of the sun's volume—that is to say, less than one-millionth of its volume—it would be sufficient to account for all the light and heat which the sun radiates into space. According to a very interesting theory the source of energy of radium and other substances of this kind is the internal energy of the atoms. The almost infinitely small particles or electrical corpuscles which seem to be driven from out these radio-active substances might produce the heat observed by their bombardment of neighboring atoms. If this view is correct, there is revealed to us a reservoir of energy inside the atoms of some elements at least which has never been suspected, but which is tremendous in its power and may not be so rare and inaccessible as we now suppose. To use a rough analogy, we have been regarding the atoms as ultimate particles of matter and we knew

nothing of their internal structure, and it is as tho we had known and used watches simply as hard, round objects and should suddenly find that they had inside them a coiled spring which was capable when released of doing work without any action on our part. In the atoms of radio-active matter the works are running, and it remains to be seen whether in the atoms of ordinary matter the springs are wound up or run down, and, if the former, how we can set them at work. A writer in *Nature* calculates that "one gram of radium gives off sufficient energy during its life to raise five hundred tons a mile high." Since the rays from radium pass so easily through the flesh and develop phosphorescent light by striking many substances, it has been found possible to produce the sensation of light even in the blind, and a case is reported of a boy blind from his first year who has been taught to read by letters illuminated in this way.

Aerial Navigation

Since M. Santos-Dumont uses his aerial yacht for his daily trips about Paris, going to the Longchamps races and stopping at his home for breakfast on the way, the public is expectant of great progress in this field. M. Santos-Dumont has constructed and is about to test an "aerial omnibus," a larger machine than any he has yet attempted. It has two decks, the upper one for the operator, and the lower, composed of three baskets, to hold fourteen passengers. The balloon is thirty meters long and will contain 30,000 cubic meters of gas. With its two propellers it is expected to reach a speed of fifty kilometers in calm weather. But this country is not to be left behind in the aerial race: Professor Langley, secretary of the Smithsonian Institution, has a houseboat, the "Buzzer," anchored off Wide Water, Va., and is expected to launch from it this week the large flying machine which he has had under construction for many years. It is said to be about sixty feet in length, and the total cost of the experiments will probably exceed \$100,000. Of this \$50,000 was appropriated by Congress, \$25,000 was contributed by the Navy Board of Ordnance, and the rest raised by private contributions. Pro-

fessor Langley is working on entirely different lines from M. Santos-Dumont, for he discards the supporting balloon entirely and depends on the swift propulsion of a large aeroplane to keep the machine in the air. The point to be decided is whether it is necessary for an air-ship to be lighter than the medium in which it floats—that is, whether the bird or the fish is to be the model.

Mr. Platt Suggests Mr. Aldrich

Senator Thomas C. Platt's tentative nomination of Senator Aldrich for Vice-President must be classed with the current outgivings of the silly season. Not that there can be any question as to Mr. Aldrich's ability. But personal ability and what the politicians call availability are not always combined. The geographical objection, sentimental tho it may be, could not be overcome in the convention. The methods of his party in Rhode Island are obnoxious to some Republicans. Some would see no political capital in his street railway operations. Others would find something to criticise in the tariff legislation which he has shaped, or in his friendly association with powerful financial interests which are not the object of universal affection. Even his Currency Bill is disliked by influential Republicans in the West. We have no reason to think that Mr. Aldrich would care to be Vice-President, or that he is not content to use in the Senate his undoubted power and ripe experience.

He Should be Nominated

Altho Prosecuting Attorney Folk has not endeared himself to the leaders of the Democratic organization in St. Louis and Jefferson City by sending so many of his party associates to jail, his popularity in the country districts of Missouri is growing by leaps and bounds. No less than seventy-nine newspapers in the rural parts of the State are saying that the party ought to nominate him for Governor. Mr. Folk is a remarkable young man. He has done his duty, and a great deal of it, with courage and rare ability, and with no apparent appetite for applause. His party will make a serious blunder if it fails to nominate him for

Governor. A surprising number of Republican votes would be cast for him.

Wise Action in Indianapolis

The worthy negro citizens of Indianapolis deserve to be commended for their attempt to guard, reform or discipline such men of their race in that city as are known to be vicious and idle. We do not know that the number of such men in Indianapolis is proportionately larger in the black race than in the white, but at this time a vicious and idle negro there, and in many other cities, is the object of much suspicion and hostility. The industrious and blameless of his race may well, for their own protection as well as for the public good, see to it that he is subjected to reforming and restraining influences. We are not saying that the good in each race should not at all times strive to reclaim their black sheep. But in these days such outbreaks of violence as those at Belleville, Evansville and Danville impose upon the worthy and law-abiding negroes of every community a special duty with respect to those of their race who are or who seem to be unworthy. We are glad that in Indianapolis this duty has been perceived and is to be performed. The example is one that should be followed elsewhere, to prevent atrocious crime and the ensuing violence of mobs.

The Birth-Rate in Fiction

We have several times discussed in these columns the causes and effects of the decline in the birth-rate, which is leading to the practical elimination of some classes, but we find a correspondent in the *Popular Science Monthly* has gone still further in the consideration of this question, and called attention to the fact that while families of a respectable size may be found occasionally in Thackeray and Dickens, they scarcely exist in Meredith, Hardy and James. A calculation of the increase of population in a typical modern novel shows only 0.43 of a child per average family. Many prophets have foretold the future disappearance of the novel from changes in public taste, scientific tendencies, etc., but here is a new and more serious danger to this type of literature, for, accom-

panied as it is by an alarming death-rate, this low birth-rate threatens the extermination of the population of the novel. The question of causes and possible remedies is now open for discussion. Evidently the law of Malthus cannot here apply, for it is just as easy to support a large family as a small one on paper, altho the luxury in which most of the characters of the modern novel have to live must require some effort on the part of the author. Very likely a heavy poll tax on all bachelors and bachelor maids left unmarried at the end of the novel and a limitation of the number of divorces allowed per volume might check this decline in the fertility of the pen.

Cruelties in the Congo

The charges of cruel treatment and practical enslavement of the natives by the Government of the Congo Free State which the Rev. W. M. Morrison made in *THE INDEPENDENT* of July 9th, have been semi-officially denied by an authority who, tho anonymous, is supposed to be no less a personage than King Leopold of Belgium. The attempted refutation, however, amounts to no more than a reiteration of the stock argument for slavery, which used to be so commonly heard in this country, that the natives are naturally lazy and unambitious, but that by a period of forced labor they may learn to work and like it. No one, however, has been able to demonstrate how long a period of tutelage would be necessary before this delightful state of mind is reached. White men, who are supposed to be less lazy and more ambitious than blacks, have not all of them been brought to a stage where they look upon labor as a delight.

We wonder whether it occurred to the minds of those who wrote and those who adopted the platform of the Kentucky Republicans that its denunciation of "assassination, whether in Servia or Kentucky, as destructive of civilization" tended to support the contention of their political opponents that the murder of Governor-elect Goebel was plotted and accomplished by Governor Taylor and some of his Republican associates holding office at the capital.

INSURANCE

Birth Insurance

The American Mothers' Birth Insurance Company of Boston, Mass., is a new candidate for public favor. The company appeals directly, if not exclusively, to women, and if it were possible for it to carry out everything that is so glowingly set forth in their recently issued prospectus, it would be a very good thing. The organization is under the fostering care of the American Mothers' Association of the United States, but entirely distinct from it, as it is not obligatory on the part of members of the one organization to join the other.

According to their own circulars the American Mothers' Birth Insurance Company is incorporated, with provisions for the necessary reserve fund under the Massachusetts Insurance laws. It is on the mutual plan, and by its means those who are members may receive, by monthly payments of a certain small sum, a graduated cash benefit ranging from \$100 to \$500 upon the birth of a living child, according to the form of membership of the beneficiary, and the number of payments made before the time of the child's birth.

The American Mothers' Birth Insurance Company in its published literature disclaims the idea of being a money making corporation. It is, of course, a "commercial" undertaking, but this feature is subdued as much as possible. It is managed by women and for women, and no officer can receive any compensation for her services. Among the incorporators and members of the advisory board are Mrs. Mary A. Livermore and Mrs. Edwin D. Mead. In order to make binding a policy in class A, issued by this company, a woman must have paid five regular monthly assessments, and annual dues of \$1, amounting in all to \$16, when she will be entitled to \$200, the conditions of the policy having been fulfilled. After she has paid in like manner eleven regular monthly assessments, the cost of which is \$34, the sum of \$300 will be available. When she has paid seventeen regular monthly assessments, the total cost of which is \$53, the sum of \$400 is recoverable, and after she has paid twenty-three

or more regular monthly assessments, costing at least \$71, including annual dues, she is entitled to the sum of \$500.

In the case of policies in class B, the payment of annual dues and five regular monthly assessments, the cost of which is one-half of that of class A, entitles her to \$150, after she has paid seventeen regular monthly assessments the sum of \$200 will be paid, and after she has paid twenty-three or more regular monthly assessments she will, upon giving birth to a legitimate child, receive under her policy with this company \$250.

For second and subsequent births, after paying eighteen more regular assessments and continuing the annual dues, the company will pay \$300. After paying twenty-one regular assessments in addition to those first mentioned, \$400 will be paid, and after paying twenty-four more regular assessments, \$500 will be paid, or \$500 at any time thereafter, so long as the policy is maintained in force. Birth Insurance has been classed by some writers among what they have expressively termed "Freak Assessment Orders," and it must be said that there are certain objections to it that obtain in all cases where incomes arise from assessment instead of fixed premiums. Birth Insurance companies are at present walking of necessity in the dark, not having any available table of probabilities, as a lamp to guide their footsteps. They must be regarded as undesirable, at least until they have demonstrated that assessment schemes of insurance are sound, which we do not believe. While there is no reason to question good intent on the part of the present managers of the Boston company, it appears to THE INDEPENDENT that the scheme as now formulated is impracticable.

....The gross assets of the Continental Fire Insurance Company, of which Henry Evans is President, have increased during the past six months \$677,819.79, so that the total assets now amount to \$13,635,660.94. The increase of the net surplus during the same period is \$403,423.60, making the total net surplus amount to \$6,122,385.67.

The Fall of Securities

It is well to bear in mind the fact that the industrial and commercial condition of the country has not warranted a great and continuous decline in the market value of securities. The decline which has taken place has not been caused by any sign that our extraordinary prosperity is about to be succeeded by depression. The promise of our crops is most encouraging. Our manufacturing industries are suffering no decrease of their prolonged activity. Consumption still presses upon production. In the iron and steel trade there is no indication of approaching dullness. The output record at the iron furnaces was broken on the first of the month, and for some months past the rate of production has exceeded 20,000,000 tons per annum. With respect to orders on hand in the steel industry the situation varies but little from that of one year ago. Railroad business has suffered no diminution, altho net earnings are affected by increased cost of materials and labor. General trade is active throughout the country. Our foreign trade for the past year shows an unprecedented total, and the imports (for the first time exceeding \$1,000,000,000) supply evidence as to the activity of our manufacturing industries, owing to the large quantity of crude materials procured from abroad. The financial condition of the National Treasury, with its great cash balance and enormous gold holdings, is excellent. The great decline of securities in itself has afforded, up to the end of last week, proof of fundamental soundness, because the liquidation has been accompanied by only two failures.

There has been no end of discussion as to the causes of the decline. The chief of these, in common estimation, has been a natural and inevitable reaction from the inflation and high prices accompanying the creation and promotion of great combinations, and the growing pressure of a great load of new shares which were undigested or indigestible. The public appetite for such shares had been satisfied. But progressive decline and the growing needs of holders forced the shares upon the market. We by no means underestimate this one of the

causes; but, even when other causes of a similar character have been added to it, the sum of them seems insufficient to account fully for what has taken place. The situation was one of more or less vulnerable conditions, but for a complete explanation of the enormous and continuous sales and liquidation there is needed an assumption that a great depressing force was, at least for a time, applied to the market. Possibly it was the expression of the anger of a billion dollars (which is something quite formidable) and the determination of the owners of the billion to accomplish certain ends and to square an account of accumulated grudges. If such a campaign was undertaken, the proof of it will eventually be available in the evidence of ends gained and enemies punished.

A STOCK EXCHANGE seat was sold last week for \$60,000. The highest price thus far reached is \$82,000, which was paid for a seat last year.

... The Old Colony Trust Company, Boston, Mass., of which Gordon Abbott is President, and C. S. Tuckerman Vice-President and Treasurer, has total resources of \$29,942,549, as shown in the statement of July 15th. The capital stock is \$1,200,000, and the surplus and undivided earnings are \$5,704,895.

... Owing to recent efforts to procure open ports in Manchuria, the official record of the growth of our trade with China deserves to be considered. Since 1893 our exports to China have increased from \$3,900,000 to \$24,700,000 in 1902 and about \$19,000,000 in 1903, the average for the three years immediately preceding 1902 having been about \$13,400,000. Exports to Hong Kong (and a large part of these enter China) have grown since 1893 from \$4,200,000 to about \$8,000,000 in each of the last four years.

... Dividends and coupons announced:

Phenix Ins. Co., Brooklyn, 5 per cent., semi annual, payable on demand.

Atch, Top. & S. F. R'way, Serial Debenture 4's, Coupons, payable August 1st.

New York National Exchange Bank, 2 per cent., quarterly, payable August 1st.

Survey of the World

Political Topics

At a conference of the leaders of the two factions of the Populist party, in Denver, last week, a reunion was announced, and the declaration was made that there would be no further "attempt to secure the enactment of Populist truth through the Republican or the Democratic party." The platform adopted calls for currency issued exclusively by the Government, "a system of transportation and for the transmission of intelligence, owned by the public and operated by the Government," and the "rule of the people through the optional referendum and initiative, and the recall of derelict officials."—The disaffection of the White Republican party of Louisiana appears to be disclosed by the publication of a circular, said to have been addressed to the members of the party by the leaders of it. In this circular President Roosevelt is bitterly denounced for what it calls his "negrophilism," which, the circular asserts, incites the negroes to crime and "leads them to aspire to an equality that the Almighty never intended them to have. No self respecting Southern Republican," says the circular in conclusion, "who loves his race, his home, or the principles of his party, can longer affiliate with a party that stands for social equality with the negroes."—Judge Alton B. Parker, of the New York Court of Appeals, declines to be interviewed on political questions. When he was reminded of the repeated mention of his name in connection with the coming Democratic nomination for the Presidency, he said that he was very happy and contented on the bench, where, if he

behaved himself, he could remain for life. "I shall remain on the bench," he added; "it is my ideal."—Senator Gorman, returning from Europe last week, was questioned as to all possible political topics, but was distinctly noncommittal. He was only a soldier in the Democratic ranks, he said, and he would not take the office of Chairman of the National Committee. The paramount issues seemed to him to be tariff reform, economy, and honesty in public places.—In Colombia the canal treaty has been referred in the Senate to a committee of ten, six of whom are said to be in favor of ratification.—Mr. Schuster, a prominent officer of the Union Bank, of London, asserted in that city last week that President McKinley had said to him, during a private interview two years ago: "My tariff bill has done its work. We have been able to build up many industries in a short time, and now gradually, but inevitably, our tariff must be reduced."

More Postal Service Frauds

In Washington last week the grand jury ordered the indictment of nine persons involved in the postal service frauds. Four of these—Ex-Superintendent Machen, Thomas W. McGregor, George Lorenz, formerly postmaster at Toledo, and Martha J. Lorenz—were already under indictment for offenses not connected with those now under consideration. The other accused persons are John T. Cupper, Mayor of Lockhaven, Pa., and proprietor of the Aluminum Paint Company; Maurice Runkel, of New York, a contractor; William Gor-

don Crawford, formerly Deputy Auditor in the Department, and for some years past the Washington agent of a lock company; Leopold J. Stern, of Baltimore, a contractor, and William Clifford Long, an Ohio politician residing in Washington. Cupper procured from Machen a contract for painting mail boxes, at high prices, and paid to Machen, through Long, ten cents a box. Stern had a contract for carriers' satchels, and paid money to Long, which the latter divided with Machen. Having relieved the contractor from furnishing the leather straps—altho the Department paid him for them—Machen bought the straps from another contractor, exacting a bribe commission of four cents apiece. This was collected by Long. Runkel, the Department says, obtained from Machen a contract for small leather cases used in the free delivery service. The cost of each was 30 cents; the Department paid 90 cents, and half of the profit went to Machen and McGregor. Crawford, a member of Washington's most exclusive club, had a contract for satchels. The Government furnished the straps, but he was paid for them, on Machen's recommendation, and Machen took about 30 per cent. of the proceeds of the contract. The money was paid to him through the agency of Mr. and Mrs. Lorenz, who were indicted some weeks ago for similar action in other cases. The checks used in all these transactions have been obtained by the Government. Machen's unlawful profits from the contracts above mentioned appear not to have exceeded \$25,000.

The Glove Contracts

The evidence collected by Inspector-General Garlington, under instructions from Secretary Root, as to the glove contracts in which Congressman Littauer, of New York, is said to have been interested, has been submitted to Judge Advocate-General George B. Davis for examination. No official statement as to the conclusions of General Davis and the Secretary has been published. Press correspondents at Washington assert in their dispatches that the evidence is regarded by General Davis as sufficient to make a *prima facie* case against Mr. Littauer,

owing chiefly to a letter, sent by the Congressman to the contractor (Lyon), in which he speaks of the latter's share of one-half the profits on certain goods supplied by Littauer Brothers to be sold by him to the Government under his contract. Mr. Littauer has employed Judge John G. Milburn, of Buffalo, and Edward Lauterbach, of New York, to represent his interests in the case. It is said that Secretary Hitchcock, of the Interior Department, will order an investigation concerning a contract for gloves to be supplied to the Indians. This contract is held by one Sellers, and it is alleged that he represents the Littauer firm.—The Commissioners of the District of Columbia have directed that an investigation be made concerning the several departments of the District Government. This action is due to the recent embezzlement of \$75,000 by one Watson, a clerk in the auditor's office. Watson was not under bonds, and it is shown that before he was employed by the auditor he had been convicted of forgery and imprisoned for that offense.

The Lynching of Negroes

Seventeen persons who were prominent in the mob that attacked the jail in Danville, Ill., have been arrested upon warrants sworn out by the brave sheriff, Mr. Whitlock, who defended his negro prisoner with a shot gun. Five more, now in the hospital, are under guard. The City Council has commended the Sheriff by resolution, and the local Bar Association has offered him such aid as it can give. But in the case of the negro, Metcalf, who was lynched before the attack upon the jail, a coroner's jury returned a verdict that he was killed by "persons unknown." In a public address Governor Yates has declared that the men in the mobs at Belleville and Danville were "nothing but anarchists." In the adjoining State of Indiana, Governor Durbin, while reviewing the company that fired upon the mob at Evansville, denounced all opponents of the militia, saying that there was no foot of Indiana soil so worthless that it could profitably be occupied by any man who struck at the institutions and liberties of the people by assailing the National Guard. It will be recalled that enlist-

ments have been prevented in Indiana by a labor union boycott. The negro who killed a policeman in Evansville, and whose crime was the cause of the riot there, has died of the wounds which the policeman inflicted. Senator Tillman, before beginning a debate in the Northwest with Senator Burton on the race question, published the following characteristic comments upon the recent lynchings in Indiana and Illinois:

"That seems to be the only practicable way, until the amendment to the Constitution granting suffrage to the negroes has been repealed. We have shot them and hanged them and burned them in South Carolina, until they almost know their proper place now, altho the desire to vote, whether or not they know what they are voting for or against, frequently causes trouble. And now, altho the black race was never a subject race in the North, the Northern people go out and settle the matter in the good old way that the Southerners have used in settling it, and the only way that has proved efficacious. The Danville and the Belleville lynchings in Illinois, and the trouble in Evansville, and similar affairs in other Northern States, all go to show that the people of the North are studying the race question. Let the good work go on, and the beauties of the Fifteenth Amendment will continue to be manifest to the world."

The mob spirit, feud assassinations, and lynchings will be the subjects of addresses at a conference to be held at Chautauqua on the 10th inst.—Only two lynchings were reported last week, one in Texas and the other in Virginia, both the lynched men being negroes accused of assault upon white women. On the other hand, several negroes were rescued from lynching mobs. In Lorain, O., a mob was induced to disperse by the arguments of the Mayor. Near Dallas, Tex., a negro named Collins, who had assaulted the little daughter of a farmer, was rescued and placed in jail by a sheriff's posse. Two hundred armed men stopped an express train near Clifton Forge, Va., Saturday night, intending to take from it two negroes who had been arrested for shooting a brakeman. The conductor locked the doors, and the passengers sought positions of safety on the floor while more than a hundred shots were fired through the windows. At a moment when the vigilance of the men guarding the engineer was relaxed, he started his engine. Thus the train es-

caped and carried the negroes to Covington, where they were safely lodged in jail.—In Alabama, last week, two more planters accused of holding negroes in peonage pleaded guilty and were fined \$1,000 each. A similar plea has been made by a Justice of the Peace named Kennedy. He was held under twenty-three indictments, but his punishment will be light, it is said, because he has assisted the prosecutors.

Our Islands in the Pacific

Secretary Root has received from the Filipino Chamber of Commerce, recently organized at Manila, a cablegram, the closing words of which are: "We pray, as salvation for the critical condition of the country, that the tariff upon our products be abolished."—The expenditures of the Insular and Manila governments are to be reduced, as the result of a careful review of estimates and appropriations by the Commission. The number of Filipinos employed in the civil service is to be increased. Natives will be substituted for Americans in many subordinate positions, and they will be advanced whenever opportunity offers.—The Sultan of Sulu has been living for several months at Singapore. His experience has been so enjoyable that he is inclined to pass his remaining years there. He has laid by something for a rainy day, and has an annual income from the pearl fisheries of his islands.—Gomez, the President of the Labor Union at Manila, has been sent to prison for contempt of court. Some time ago he was accused of embezzling the funds of the union and using them in supplying arms to bands of insurgent ladrones. The union, which is allied to the National Party, went into bankruptcy. Its newspaper was placed in the hands of a receiver, who suspended publication. Gomez has been punished for contempt because he resumed the publication of the paper without the receiver's consent. The task of organizing the workingmen appears now to be in the hands of a delegate of the American Federation of Labor, who predicts that wages will soon be increased.—In Hawaii, the Home Rule Party, at its convention on the 29th ult., adopted a platform denouncing the ad-

ministration of Governor Dole as oligarchical and corrupt. Robert W. Wilcox, formerly Hawaiian Delegate in Congress, urged that Congress should be asked to give the islands independence like that which Cuba enjoys, but the convention decided that the time was not ripe for such a movement.

To Pay the Cuban Army

Rumors of the existence of a large band of revolutionists in Santiago province appear to have had no foundation in fact. Near Bayamo a party of four bandits proclaimed a revolt and caused some annoyance until the Rural Guards captured the leader and killed his three associates, two of whom were jail-birds. Two days later (on the 30th ult.) it was reported that sixty armed and mounted men were moving about in the Cauto River district, proclaiming a revolution because the soldiers of the Cuban insurgent army had not been paid. Whereupon the Rural Guards, reinforced by a company of volunteers, scoured the country and were unable to find any trace of the sixty patriots. Peace having been restored, the volunteers disbanded.—It is true that some of the soldiers of the revolutionary army regard with impatience the failure to provide for their pay. After ten months' work a commission has completed the army list, which bears the names of 53,000, including the dead. The amount due is estimated to be about \$45,000,000. Another commission will hear claims based on the first one's statement and will report to President Palma. Dispatches from London say that if the Government finds it difficult to negotiate in the United States the proposed loan of \$35,000,000, the money can be obtained in England, several financiers having assured the Cuban Minister in London that they are ready to subscribe. The loan commissioners have not yet been appointed.

Labor Controversies

Judge Gray, who was chairman of the Anthracite Strike Commission, has consented to serve as umpire or fifth member of the arbitration board which is to settle the labor dispute at the Ala-

bama coal mines. To do this he foregoes his August vacation. The 35,000 organized coal miners of Missouri, Kansas, Arkansas and Indian Territory have reached an agreement with their employers concerning wages. The increase of their pay will be from 7 to 11 cents per ton, and the employers announce an increase of 50 cents per ton in the selling price of coal.—At Idaho Springs, Col., on the night of the 28th ult., the buildings of the Sun and Moon mine were wrecked and the main shaft was injured by an explosion of dynamite. A watchman fired at two men who were seen running away, killing one of them, a member of the local miners' union. There had been a strike since February and non-union men had been set at work in June. After this explosion twenty-two members of the union, including the president and all the other officers, were arrested. At the close of a meeting of business men on the 30th 500 citizens took the arrested members of the union from the jail, marched them to the city's boundary line and warned them never to return. It is said that letters captured with the prisoners clearly connected the officers of the union with the explosion. The exiles went to Denver and employed counsel there.—Miller, the assistant foreman in the bindery of the Printing Office at Washington who was reinstated by the President's order, has returned to work. The union is awaiting Public Printer Palmer's action concerning its supplementary charges against Miller. Members of the union have been informed by the Civil Service Commission that if they should strike they could get their places again only by civil service certificates. The decision of the Commission as to the granting of such certificates will not be made until a case is presented.—Lawrence Murphy, the former treasurer of a stonecutters' union, at whose trial in New York for embezzling the union's funds interesting testimony was given as to the exaction of large sums from employers, has been found guilty and sent to prison for five years. He and his wife now assert that they can and will supply evidence of many instances of extortion by unions in the building trade. Murphy says that men who received most of the money which he was accused of steal-

ing testified against him to make him a scapegoat. The associated builders gave the union represented by Samuel Parks, the indicted walking delegate, one more chance to accept the arbitration plan. It was rejected, and the followers of Parks celebrated their victory by carrying him about on their shoulders. The builders are now employing all individual workmen who subscribe to the arbitration agreement, but a large number of union men are still idle.—It is said that the number of children employed in the cotton mills of Georgia will be reduced one-half by a law passed last week, which classes as vagrants, subject to punishment, all persons who, being able to work, live in idleness upon the wages of their minor children.—The street railway strike in Richmond is still in progress. A car was thrown from the track last week by a dynamite explosion, but the passengers escaped injury.—A letter has been sent by the Employers' Association of Kansas City, which has 7,000 members, to President Roosevelt, thanking him for ordering the reinstatement of Miller in the bindery of the Government Printing Office.—One hundred of the non-union employees of the Kellogg Company, in Chicago, have been authorized to carry arms and directed to defend themselves and the company's property. Several of them have been sworn in as special policemen. The strike at the company's works has been marked by much violence. The Chicago Federation of Labor has voted to assess its 300,000 members \$15,000 a month in support of the strikers.

The Hungarian Diet

The obstructionists succeeded in breaking up two sessions of the Diet by shouting, singing and banging desk-lids whenever the Premier, Count Khuen Hedervary, rose to open the debate on the Indemnity bill. Finally the Premier made his motion in writing, but it was torn from the hands of the Clerk of the House by the deputies who filled the tribune. At midnight on Wednesday the obstructionists withdrew, singing the Hungarian national hymn and declaring that any further action would be illegal. The majority proceeded to vote the reading of the bill and afterward adjourned.

Deputy Zolman Papp laid upon the table in the lower House of the Diet 10,000 kronen, which he said had been given him by ex-Deputy Dienes as a bribe to desert the obstructionists and leave Budapest. A warrant was issued for the arrest of Dienes, who is reported to be on his way to America, and the Chamber has elected a commission of fifteen members to inquire into the bribery cases. The money was furnished by Count Ladislaus Szapary, one of the richest of the Hungarian magnates and an intimate friend of Count Hedervary. He has resigned his position as Governor of Fiume on account of the exposure, but declares that the Prime Minister was entirely innocent of complicity in the attempted bribery, and knew nothing of it. This attempted bribery has greatly strengthened the hands of the Hungarian nationalists, who are demanding the resignation of Count Hedervary, and will attempt to prevent all legislation until this is accomplished. Franz Kossuth has resumed the leadership of the Independence party, which he resigned because he did not approve of the violent methods of the obstructionists.

Russian Administration

It was supposed from the recent manifesto that the Czar favored granting a greater degree of local self-government; but if this was his purpose, it is apparently not being carried out, for all the changes made since this policy was declared tend rather to increase the power of the bureaucracy and the police. At a conference of the Ministers of the Interior, of Finance, of Agriculture, of Justice, and the State Councillor, what in other countries would be called a cabinet meeting, held under the presidency of the Czar, it was reported that

"all the members of the conference agreed with the Minister of Finance [M. Witte] that in the present condition of local institutions only a small number of questions—namely, those without general interest for the State and otherwise unimportant—could be left to the decision of the local authorities."

It is proposed to reform the provincial and district administration with the object of concentrating the control of all local institutions of each province in a council, to be presided over by the Gov-

ernor, who in that way would be restored to his original dignity of Lord of the Province. The Czar expressed his approval of this peculiar way of carrying out his policy of extending local autonomy. The new constitution of the Municipal Council of St. Petersburg is also more bureaucratic than before. The councilors are to be elected for six years instead of three, and all important actions and decisions must be approved by a board under the authority of the Minister of the Interior. The following are entitled to vote: Persons of both sexes (women by proxy) possessing property worth \$1,500, trading companies, scientific societies, religious and charitable institutions, occupiers of tenements paying not less than \$16 annual tax. Jews are excluded from the franchise. The first class of electors, the larger rate payers, who pay in the aggregate one-third the total sum, elect one-third the councilors. The second class, comprising the rest of the voters, elect the remaining two-thirds of the council.—Secret instructions sent out to all parts of the empire authorize the police to arrest any persons attempting to collect or address a crowd on the street, and they are empowered to barricade the houses and the streets, stop the street car service, and call out the soldiers of the garrison to suppress any popular demonstrations.

The Czar and His People

Labor troubles in the southern part of the empire are becoming serious and assuming political importance, since the riots are reported to be incited by the Armenians. At Mikhailovo, on the Transcaucasian Railroad between Tiflis and Batum, the strikers attempted to stop a train and attacked the soldiers with stones and revolver shots. The guards fired and killed ten and wounded fifteen of the workmen. A few days later the strikers tried to wreck a train by removing a rail. Twelve cars were smashed and two people killed. The soldiers fired upon the rioters, killing twenty-one. In Odessa commerce is impeded by strikes of dock laborers, sailors and street-car men.—Prince Mestchersky has started a journal called "Friendly Words," for the purpose of counteracting the revolutionary tendencies of

workmen and peasants. It is distributed by local officials and read in the public schools by order of the Czar.—In reply to the numerous attacks on Russia made in caricature in the United States the *Novoe Vremya* published a cartoon representing Uncle Sam driving an automobile over two negroes, a whip in his right hand and in his left the American flag with "Freedom" inscribed on one side and "Slavery" on the other.—General Bobrikoff, the Russian Governor-General of Finland, continues to exile all prominent Finlanders who stand up for the ancient liberties of their country. Within the last few months nineteen important men have been driven from their homes at a week's notice, among them the Burgomaster of Hango, four members of the Finnish Diet, editors and publishers, instructors in Lyceums of Viborg and Uleaborg and professors in the University of Helsingfors, clergymen and merchants.—Extensive preparations have been made for a five days' ceremonial at the monastery of Saroff on the occasion of the visit of the Czar and Czarina to the relics of St. Seraphim, and the Holy Synod has issued a statement that it regards the

"appearance of a new miraculous intercessor as a renewal of heaven's blessing upon the government of our most exalted monarch, who labors unceasingly for the welfare of the Orthodox Russian people and embraces in his royal love and care all of his true subjects, of every class and condition."

This latest of Russian saints was a Prakhor Moshnin, who entered the monastery of Saroff at the age of seventeen and spent his long life in prayer and self-torture. He died in 1833, and in 1892 a commission appointed by the Holy Synod reported in favor of the genuineness of the miracles done during his life and by his relics among the millions of pilgrims who have visited his cell since his death, and accordingly he was canonized on January 29.

The Papal Election

On the afternoon of July 31st the cardinals took up their residence in the Vatican, and after the Marshal of the Conclave, Prince Chigi-Albani, his captains and the guards and conclavists had taken

the oath to defend the Conclave and maintain its secrecy, all outsiders were dismissed and the doors locked simultaneously on the inside by the Camerlingo and on the outside by the Marshal. Since then up to the time when we go to press no reliable information has transpired as to the proceedings inside. A ballot is taken at ten o'clock in the morning and another at five in the afternoon in the Sistine Chapel, and after the scrutiny the ballots are burned. The Piazza of St. Peter's and the semicircular colonnades have been crowded with people after each ballot, watching the smoke which comes from a small tin pipe projecting from a window in the Sistine Chapel, for, according to custom, damp straw is thrown on the fire after the burning of the ballots if it has resulted in no election. On Sunday evening it was estimated that there were over fifty thousand people waiting in front of the basilica to see if the smoke were black or light, and, if the latter, to see the new Pope as he appeared on the balcony and gave his first benediction "to the city and the world." Two thousand Italian soldiers were stationed between different sections of the crowd to prevent dangerous rushes.

Persia Reports have just been received of massacre of Babis in the province of Yezd, Southern Persia, in which the mob for two days butchered every Babi who could be found and dragged their mutilated bodies about the streets. Houses were looted and women beaten and killed. The mob was led by priests, and finally forced the Governor, by setting fire to the palace, to join in the persecution and by his orders one of the Babis was blown from the mouth of a cannon and another had his throat cut. The Babis are a Mohammedan sect, founded by Mirza Ali Muhammad ibn Radhik, the Bab, in 1843, and superior to the orthodox Mohammedans in morality and in the position accorded to women. They have been persecuted very frequently in the last fifty years and have instigated several rebellions and attempts to assassinate the Shah, so the attack now made on them is due to political motives as well as religious bigotry.—A treaty has been made between Persia

and England by which the five per cent. export tax is abolished on all except a few articles, and British merchandise is to be admitted on the same terms as that from any other nation.

Reaction in China

The conservatives in China are again dominant, and the viceroys, at the instigation of the Empress Dowager, are endeavoring to suppress all freedom of speech, even in the free ports. The Taotai of Shanghai, acting under instructions from Peking, causing the arrest of the editor and the staff of the native paper, *Supao*, which had published articles denouncing the corruption of the Manchu ruling class. Examined before the mixed court at Shanghai two of the editors pled guilty and would have been sentenced to a term of imprisonment for sedition, but the Chinese Government demanded their surrender on the ground that the mixed court had no jurisdiction over such an offense by a native. The case was submitted to the foreign ministers at Peking and is not yet decided. Technically, the Shanghai authorities do not seem to have the right to refuse the demand of the Chinese Government; but if it is complied with it will mean the suppression of free speech, which has hitherto prevailed in the foreign ports, and will be a crushing blow to the reformers in the empire. The editors would probably be put to death by torture, for a journalist named Shen Chien has just been beaten to death with bamboo rods in Peking, in accordance with special instructions of the Empress Dowager, because he advocated the overthrow of the Manchu dynasty. The names of forty residents of Peking who have criticised the Government have been presented to the Empress Dowager by the reactionary officials, with the recommendation that they be severely punished. Chang-Chi-Tung, ex-Viceroy of Nanking, who was formerly supposed to have liberal tendencies, is now one of the most violent of the reactionaries, and is in Peking in close touch with the Empress Dowager, who has appointed him to the Ministry of Education, in charge of the revision of the constitution of Peking university and the provincial examinations. At the examinations recently held

in Peking all those candidates were refused office who wrote on Governmental affairs instead of the usual classical topics. Chang-Chi-Tung is supposed to be responsible for the delay in the treaty negotiations with the United States, as he wants the mining and patent rights restricted and extra-territoriality and morphia trade abolished. It is reported that the Russian Government has notified Peking that it is impossible to open any Manchurian ports at present, but after six years the country will be opened to free commerce.

British Railways in China

Sir Ernest Satow is returning to China from England to press for more favorable terms for British railways. Meanwhile Mr. Townley, the British *Chargé d'Affaires*, has formally presented four proposals to Prince Ching and the Wai-wu-pu. They are:

(1) That China shall give the Government 5 per cent. guarantee for the Pekin Syndicate railway, already partially constructed from the Wei River, Ho-nan, to Tse-chau, the center of the South Shan-si coal measures, on the same terms as have been granted to the Russo-Chinese Bank for the Ching-ting-fu-Tai-yuen-fu Railway.

(2) That favorable running powers be granted to the Pekin Syndicate for the transport of minerals from their Shan-si mines over the Franco-Belgian Peking-Han-kau main line as far south as Yencheng, including the bridge over the Yellow River soon to be begun. From this it will be seen that the Pekin Syndicate have abandoned their original scheme of connecting their Shan-si mines by means of their own railway and their own bridge across the Yellow River to the Yang-tsze.

(3) That the British and Chinese Corporation and the Pekin Syndicate shall be granted conjointly a concession to build a railway from Yencheng aforesaid to Pu-kau, opposite Nanking, on the Yang-tsze.

(4) That China shall give an assurance that if she constructs a railway from Hu-peï to Sze-chuan and the assistance of foreign capital is required preference for such capital shall be given to the British as first in the field.

There is no reason why China should not grant all four of these proposals; but to the third France has offered strong opposition, alleging that a branch line from Yencheng to Pu-kau will divert traffic from the main line, in which they are interested. The French Minister has accordingly warned China that, if this concession is granted to the British, an adequate indemnity must be paid to the Franco-Belgian syndicate.

Future of the Korean Students in Japan

It has been a remarkable sign of progress in the Far East that in these five years Japan was receiving so many students from India, China, Siam and Korea. Ten years ago there was not a single foreign student in the Government schools in Tokyo, but now there are over two hundred in her various educational institutions. While Japan was sending her own young men and women to Europe and America to acquire the Western civilization, she has made herself now to be the "schoolmaster of Asia." The number of these foreign students is increasing rapidly every year, not only male but female students from China as well. It is, however, reported that the Korean students seem to be decreasing gradually, simply because the Japanese Government does not take care to find out positions for them after their graduation, as that of Russia does. So the students began to go to Russia instead of coming to Japan. Moreover, Li Yo T'ai, the Korean Minister to Japan, secretly ordered his Government students a few months ago to go back to Korea and not to stay any more in Japan. The half of them have obeyed the order, while the remainder were scarcely supported by the sympathy of the Japanese officers in the navy and army. But it is wondered how long such a condition will continue, for in Russian schools, unlike the Japanese schools, the Korean students will find it very burdensome to master the language before they can start to acquire knowledge. If the Japanese Government will undertake to provide for the future of the students there will be seen a more rapid increase in the number of the students than was ever seen before.

Religious Instruction in the Public Schools

By W. T. Harris, LL.D.

UNITED STATES COMMISSIONER OF EDUCATION

THE principle of religious instruction is authority; that of secular instruction is demonstration and verification. It is obvious that these two principles should not be brought into the same school, but separated as widely as possible. Religious truth is revealed in allegoric and symbolic form, and is to be apprehended not merely by the intellect but by the imagination and the heart. The analytic understanding is necessari-

WILLIAM T. HARRIS

ly hostile and skeptical in its attitude toward religious truth. The pupil is taught in mathematics to love demonstration and logical proof, and he is taught in history to verify the sources and to submit all tradition to probabilities of common experience. The facts of common experience dealing with the ordinary operations of causality are not sufficient to serve as symbols of what is spiritual. They are opaque facts and do not serve for symbols; symbols are facts

which serve as lenses with which to see divine things. On themes so elevated as religious faith deals with, the habit of thinking cultivated in secular instruction is out of place. Even the attitude of mind cultivated in secular instruction is unfitted for the approach to religious truth. Religious instruction should be surrounded with solemnity. It should be approached with ceremonial preparations so as to lift up the mind to the dignity of the lesson received. Christianity is indeed the religion of the revealed God, but there is no revelation possible to the mind immersed in trivialities and self-conceit. In religious lessons, wherein the divine is taught as revealed to the human race, it is right that the raw, immature intellect of youth shall not be called upon to exercise a critical judgment, for at his best he cannot grasp the rationality of the dogmas which contain the deepest insights of the religious consciousness of the race.

The advocate of the parochial school often urges by way of rejoinder his view that the secular branches ought to be taught in the same manner as the catechism, which teaches the dogmas of the Church by authority; and it is a fact in parochial schools that the influence of the dogmatic tone sometimes creeps into the secular recitations, and too much authority in secular studies prevents the pupil from getting at the vital points. He cultivates memory at the expense of thought and insight, for the best teaching of the secular branches requires the utmost exercise of alertness and critical acuteness of the intellect. The spirit of authority loves dogmatic assertion and the memorizing of the exact words of the text-book. It represses the investigating spirit and stifles independent thinking. Arithmetic, algebra and geometry cannot be learned by authority. It is, in fact, a nearer approach to the divine to have an insight into the necessity of mathematical proof than it is to take the results of demonstration on authority.

In view of these differences between

religious instruction and secular instruction, and in view of the contrast between the spirit of the school and the spirit of the Church, it is clear that the school cannot successfully undertake religious instruction; in fact, experience goes to show that the school fails to achieve success when intrusted with religious instruction, and it is certain that the Church becomes less efficient when it abates in any way the impressiveness of its ceremonial in its art and music and in its use of the language of the Bible in its ritual.

The doctrine of the divine human nature of the true God contains in it as a germ all of Christian civilization. All of the good things which form the power and the glory of civilization flow as a result from this doctrine—viz.: Science, the useful arts by which nature is conquered for the service of man; literature, history and philosophy—all these have a particular endowment derived from the religious doctrine of Christianity, and you cannot successfully teach them to a people that is bound to a heathen creed.

A mere nature religion does not admit of science, free thought and the control of matter and force by machinery, for these are the elements that the heathen mind worships, or dreads with a mortal fear as evil demons, and the savage man spends his whole life in trying to propitiate them with ceremonies and sacrifices.

With the doctrine of the transcendence of the human soul, its separation from nature even while in the body, and in its immortal individual and social life beyond the grave, man attains a free attitude toward nature and may explore it not only without fear but with a confidence that it ought to be made of service to man in every one of its processes. Human invention may freely discover combinations through which the elemental forces—wind, water, fire, electricity and gravitation—may be harnessed for the use of man, nay, even for his comfort and for his amusement; that is to say, for his bodily wants of food, clothing, shelter and recreation—for his bodily wants as well as for his spiritual wants, such as intercommunication of all men with all men, sharing in all experience of life; sharing in all discoveries

in science, in the use of all discoveries and inventions; sharing in all insights into the divine conduct of the world or into the ultimate ends of nature and man, participating in the great deeds that tend to benefit the race.

It took long centuries to arrive, under Christianity, at the stage of conviction and insight which dispossessed nature of its demons, and reached the doctrine of a divine reason acting through beneficial laws. The earlier view was that of a divine power which could manifest its transcendence over nature only by occasional arbitrary interventions that set aside those beneficent laws. The opposition to science on the part of the superstition which is inseparable from nature-religions took a new form in the Hebrew religion, the religion of the Old Testament. The great doctrine of God's transcendence, on which depend man's freedom and immortality, was revealed first in the form of miraculous interference with the course of nature. God in the Old Testament was seen not so much as a Providence creating and nurturing individuality into freedom and responsibility through nature, as a God manifesting his independence of the world and of its laws by interference for occasional reasons with the order of nature. Hence, too, death, and its causes through pestilence, famine, floods, storms, conflagrations, accidents by sea and land have been dwelt upon in the past by religious teachers with more emphasis as revelations of divine power than the far deeper revelation of the divine in nature as creative and nurturing power.

Even the bare enumeration of Christian doctrines in language partly secular is sufficient to show the impossibility of their introduction into the curriculum of schools supported by public taxes. Even the doctrine of the existence of God implies a specific conception of Him, and the conception of the divine varies from that of the finite deities of animism to the infinite deity of East Indian pantheism and the Holy Bible. It varies from the pantheistic Brahm, whose concept is that of negation of all attributes, to the Jehovah of the Bible who is self-determined and personal, but elevated entirely above nature. Mere deism is opposed to all of the creeds of Christendom. When we

come to teaching a live religion in the schools we see that it must take a denominational form, and moreover it must take on the form of authority and address itself to the religious sense and not to the mere intellect.

The Church has through long ages learned the proper method of religious instruction. It elevates sense-perception through solemn music addressed to the ear and works of art which represent to the eye the divine self-sacrifice for the salvation of man. It clothes its doctrine in the language of the Bible, a book sacredly kept apart from other literature, and held in such exceptional reverence that it is taken entirely out of the natural order of experience. The symbolic language of the psalms, the prophets and the Gospels has come to possess a maximum power of suggestiveness, powerful to induce what is called the religious frame of mind. The highest wisdom of the race is expounded before the people of the congregation in such language and such significant acts of worship as to touch the hearts of young and old with like effect.

We must conclude, therefore, that the prerogative of religious instruction is in the Church, and that it must remain in the Church, and that in the nature of things it cannot be farmed out to the secular school without degenerating into mere deism without a living Providence, or else changing the school into a parochial school and destroying the efficiency of secular instruction.

The Church ceremonial that is the most elaborate will suffer least injury from the disenchantment produced by the

higher criticism of the Scriptures and by the mechanical and atheistic interpretation of scientific discoveries. The great hymns of the Church, such as the "Dies Irae," the "Stabat Mater," and the galaxy of Latin hymns which express all the phases of Christian feeling and thought, when well rendered by a fitting music that is religious to the core, furnish a perennial vehicle for religious instruction. One is to remember that religious music of the highest order is in process of composition in our time, altho painting and sculpture have not discovered how to retain religion in the realistic forms of art. Music and poetry yield themselves to religion, and the highest poetry and music have done this for hundreds of years. The true esthetic is the vestibule and forecourt of religion. One feels sure that the Church must not relax whatever of strict theological teaching it has in operation, and its theological seminaries must recover from the blighting effect of Kant's Third Antinomy. And I for one must think that those denominations which have least ceremonial should consider carefully the use and function of ceremonial, such as it is and has existed, in reaching the spiritual sense through its transformation of imagination and sense perception. Above all, the Church management must not rest in security on the belief that the time is coming when it may safely rely on an unsectarian instruction in the elementary schools for the spread of true religion, nor rely upon the re-establishment of parochial schools in place of free schools under Government control and supported by public taxes.

Jacet Leo XIII

By Father John B. Tabb

"BEHOLD, the aged Lion, Lord,
I am,
Now come to lay me down
Beside the Lamb."

ELLICOTT CITY, MD.

Leo XIII's Physician

By James J. Walsh, M.D., Ph.D.

DURING all the anxious days while the world hung in suspense and expectation for the inevitable fatal news from the death bed of Pope Leo XIII, there was mingled with other feelings not a little of wonder that a frail nonagenarian should cling to life with such persistency, in spite of pathological developments that not infrequently take off without delay even the young and vigorous. The daily bulletins showed the reliance of the Papal physician upon his illustrious patient's vitality, which he evidently appreciated very fully, and more than a few of the daily readers must have been tempted to ask themselves whether this calm and judicious medical adviser did not have much to do with prolonging the old Pontiff's life in the midst of the many cares that in recent times particularly have been bearing down upon it.

There is, I think, a general consensus of opinion among physicians who have followed the details of the Pope's illness with any care that the medical treatment was all that could be expected from a great leader in modern clinical medicine, and not a few of them have been tempted to ask who this Doctor Lapponi is, of whom the world has heard so much, yet knows so little, since he is not set down among the world's reputably great medical clinicians. While at Rome during the jubilee year, 1900, shortly after the meeting of the International Medical Congress at Paris, I was struck by the Pope's frail appearance on the two or three occasions when I had the opportunity of seeing him welcome large pilgrimages in St. Peter's; yet I was still more impressed with the evident vigor of the delicate body, the excellent voice that could be heard at such a distance in the immense cathedral, and the look of reserve power that the strong face contained. So I sought and obtained an interview with the Papal physician, with the idea of getting at the secret if possible of the wonderful vitality and prolonged life of his patient.

I had no difficulty in having a few

words with Doctor Lapponi after one of his daily visits to the Pope at the Vatican, and found him perfectly willing to discuss medical matters with an American colleague. Later, in a modest apartment in the old fashionable quarter of Rome—that is, in the district mainly affected by the old Roman nobility who have remained faithful in their devotion to the Holy See—I had first to tell him what I considered was new in the transactions of the Thirteenth International Medical Congress at Paris, attendance at the sessions of which had been my main purpose in crossing the Atlantic. He was interested in every detail of medical advance, tho evidently little affected by reports of progress in surgery.

I was not a little surprised to find how familiar were many phases of American medicine to this Old World physician. He had Pepper's "System of Medicine" and many another volume by American medical writers on his shelves, and was very ready to tell how much he appreciated the work of such men as Loomis, Da Costa, Weir Mitchell, and, of course, Dr. John Billings. He said that the catalogue of the library of the Surgeon-General of the United States Army was his constant refuge when he wanted detailed information on any puzzling medical subject, and he did not hesitate to say that its compilation had been a very beneficent humanitarian work for our Government to have undertaken, and one worthy of a great republican people. It was very evident that the Pope's physician was quite as deeply sympathetic with Americans and American ideas as was the Pope himself. While he occasionally used certain English terms, however, he did not, as so many foreigners who think they know some English, insist on inflicting them on every possible occasion on English speaking visitors, who would ordinarily find his native Italian or his excellent French much more intelligible.

After a while Doctor Lapponi consented to tell something of the medical story of his illustrious patient. There was not much to tell. As to his longevity,

it was not surprising, since Leo's brother and a number of his relatives in the preceding generation had lived well beyond their eightieth year. As to Leo's continued good health, Doctor Lapponi considered that it must be attributed to the very abstemious life that he had always led. He had never been very strong, and had learned the lesson very early in life that certain warnings as to the limits of his strength and his capacity for food must be regarded. Doctor Lapponi did not hesitate even to generalize a little and say that as a rule the long lives are not so frequently those who have an excess of vitality, and so easily abuse their powers, as those who very early in life have to learn the precious lesson of moderation in all things if they are to have the health and strength for the work they would like to accomplish.

Only on one occasion did Doctor Lapponi find himself obliged to oppose the wishes of the Pope in a matter that he considered of serious importance for the Pontiff's health. It happened not long after Lapponi became Papal physician that Leo lost, with but a short interval between them, two of the best of his remaining teeth, and those on which, by habit, he mainly depended for the proper mastication of his food. He resolved, tho then over 80 years of age, to have a complete new set of artificial teeth made for himself, and he communicated his idea to his physician. Doctor Lapponi at once refused his consent, and when the Pope demanded his reason said that he felt sure that a new set of teeth would tempt an old man to eat things that would disagree with his old stomach, and that they would only serve, according to the old proverb, to dig his grave with. Leo saw the reasoning and gave up the idea of the new denture.

Under ordinary circumstances the old Pontiff made an excellent patient, Doctor Lapponi assured me, except for the fact that he would attempt to do too much work and would not take enough sleep. Even in these matters, when the doctor actually placed him under positive orders, he obeyed without murmur. As a rule Leo did not take more than five hours of sleep in the twenty-four, and six hours of rest was his invalid allowance or was taken under orders at trying times or when

convalescing from some passing ailment. Like many of the great men of the nineteenth century, who yet lived to good round old age, Leo had always been especially abstemious in the matter of sleep and had that faculty of finding rest by a change of occupation which is so characteristic of hard workers.

At the end of an interview one day I ventured to ask Doctor Lapponi the circumstances of his appointment as Papal physician. He said that it had come to him as an entire surprise. He was practicing in a little town not far from Ancona, on the eastern shore of Italy. As a matter of fact he was at the time what we would consider a village physician. His predecessor in the office of medical attendant to the Pope had been dead for some time, and there was question of his successor. Owing to the policy adopted by the Holy See since the invasion of Rome by the Italian Government, none of the professors at the University of Rome was eligible for the position, since they were considered to be allied with the hostile Government party which controlled the university. Accordingly it was resolved to choose the Papal physician from outside of Rome. In most of the Italian cities the same difficulty was at hand, since the universities were all under the Italian Government.

A Cardinal who was very close to Leo XIII in all his councils and who was still alive at the time when Doctor Lapponi was telling me the story (for he seemed careful not to mention his name) had met the doctor at Ancona some time before during an official residence in the district. He had been impressed by his medical skill, but much more by his practical common sense. Having been treated in a severe illness by Doctor Lapponi, he thought him eminently fitted for the care of the old Pope. Accordingly one day there came, without any warning, to the village physician a formal document asking him to go to Rome to accept the position of physician to the Pope.

Lapponi could not believe his eyes. For a moment he thought of the possibility of a practical joke, but the invitation came through official channels. He at once made his way to Rome. From the very beginning he won the confidence

and respect of the Pope and his household. Like many another village physician, he had in him possibilities that only needed the proper opportunity to develop in a striking manner. As the result of his formal connection with the Papal household many of the old nobility of Rome who were faithful to the Pope became his patients, and in a few years he assumed an important place in medical circles in the Italian capital. His change of circumstances did not turn his head, however, and he was always noted for his thorough-going conservatism and for practical common sense application of modern medicine in his practice.

During visits to the clinics and hospitals of Rome, I took occasion more than once to ask professional opinions of Laponi's attainments. All were agreed that he had assumed his position with

a proper sense of professional dignity and without any of the pretensions that in a smaller man might have easily proved very offensive to his new colleagues in Rome. He had not made any undue use of his position in the Papal household to extend his private practice, and as to his care of the Pope, there was no voice except that of praise for his thoroughly rational therapeutic methods. Tho only a country physician at the time of his appointment, he had in him all the possibilities for his high position, and filled it with honor.

Now that his work is done, there is no doubt in my mind that he accomplished it worthily and in a manner that could not have been bettered by any one of his generation. The office sought the man, and the man proved equal to a great opportunity.

NEW YORK CITY.

Mission Work and Education Reform in China

By His Excellency Sir Chentung Liang Cheng

ENVOY EXTRAORDINARY AND MINISTER PLENIPOTENTIARY OF CHINA TO THE UNITED STATES

[At our request the Chinese Minister gave our representative an interview on the above subject, from which the accompanying article was written.—EDITOR.]

A FACTOR that must always be taken into consideration when discussing any question in regard to the great country of China, but one that is often overlooked, is its almost immovable conservatism and the vast antiquity from which this conservatism springs.

The Empire of China antedates ancient Egypt. When the Pharaohs were building the pyramids China, with a high state of civilization, was moving onward under a firmly established government. While Europe was still a wilderness peopled with barbarians and the Western continent had no place on the map of the known world, China possessed a civilization that included letters, ethics, religions and politics. Long centuries before the other nations had wakened to its use, China had invented gunpowder; with the Mariners'

Compass, which they had devised, her sailors were exploring the waters of their outlying seas for cycles before those of other lands borrowed it from them. She discovered the use of type two hundred years before Gutenberg was born; while the rest of the human family still clothed itself in the coarse breech cloth, or made their garments from the skins of animals, China was manufacturing silk, and was producing the porcelain which is yet the admiration of art connoisseurs. Twenty-two centuries before the Man of Galilee trod its green hills the sages of the "heathen Chinese" were delving in alchemy, and were making astronomical observations among the stars of heaven. Ages preceding their introduction into Rome and Greece the arts and literature were familiar to the scholars of this far Eastern kingdom. For fifty continuous

centuries China has been making her history.

This antiquity has bred a conservatism which of itself militates against any innovations or reforms, so much so, indeed, that the Western world has listed China among the nations of the past, one that has long been dying from her own cumbrous weight. But a nation that has lived and flourished through all the vicissitudes which have assailed her in the five thousand years of her existence, and yet who in all of that time has kept intact her every essential characteristic cannot truthfully be classed beyond hope. She is a self-contained nation. For almost five millenniums she has lived entirely within herself. Her 1,300,000 square miles includes every climatic condition; her flora and fauna and agricultural products provided for the needs of her numerous millions, her mineral wealth and manufactories made her independent of the supplies from other countries. She was, in fact, a

CHENTUNG LIANG CHENG, K.C.M.S.

world unto herself, and it is not surprising that her people came to believe that there was nothing to be learned beyond her own colossal wall.

Her people are the natural products of her history. Unswerving reverence for the past permeates all classes of society and an inherent superstition binds them irrevocably to their customs and habits. They are not an impressionable people, but they are an industrious one. The average Chinaman has a passion for labor; the search for it is the one thing that will drive him out beyond his country's wall. No man of any race will work longer hours, or more willingly and conscientiously, than will the "little yellow man of the Orient." If he is a day laborer, he is always obedient, always patient, docile and unfailingly faithful to his superiors; if he belongs to the literati, or is a mandarin, he is capable of prodigious mental work, or performs an unlimited number of official duties. The Chinese are not one great nation welded by one language and one religion. China is a vast federation of many States and many dialects, where three distinct religious systems hold dominating sway.

It is to this ancient land and to this conservative people that the

Chinese Minister's Oldest Daughter, Little Miss Whan-Mi, and Oldest Son, Arlu

heralds of the Christian religion have come, and without a moment's hesitation it will be conceded that to them belongs the major part of the credit for opening China's closed doors. From the days of the Nestorian Christian in the third century, the priests of the Church of Rome in the thirteenth, or the coming of the Protestant adherents in the beginning of the eighteenth, the missionaries have penetrated far into the heart of the country, and have invariably been the frontiersmen for trade and

As has been said, the conservatism of the Chinese makes them slow in accepting any innovations, and it speaks volumes for the perseverance of the missionaries, as well as for the excellent results of their endeavors, that some twenty different Christian denominations are working successfully throughout the kingdom. Their mission stations, schools and hospitals are scattered, more or less sparsely, in all parts of the country. There are almost three thousand Protestant missionaries

The Andover Baseball Nine of 1881, Sir Chentung at Extreme Right

commerce. The unselfish devotion, perhaps in individual cases tintured with some bigotry of sect, but notwithstanding a most admirable, unselfish devotion, has characterized the labors of the missionaries in China. While in a state of progress the work must have seemed discouragingly slow, yet looking at it as a whole at this time, the zealous and philanthropic Boards in America and England which have sent out their representatives must see much reason for encouragement.

there, with double that number of Catholics. The Chinese as a nation are eager for instruction, and perhaps this fact underlies much of the success of these Christian missionaries, as almost every station conducts some kind of a school. Many of them are of a high standard and command universal respect. The Anglo-Chinese college of the Methodist Board at Shanghai, at the time of the Boxer trouble, had 350 pupils, Chinese boys, and since its establishment in 1888 it has had more

han 2,000 scholars. The colleges of the same Board at Nanking and Suchau are also flourishing. The mission college at Canton is the largest school of its kind in that part of the country. St. John's Episcopal School at Shanghai has 150 pupils, and the University at Peking, of which the distinguished Doctor Martin was so long the honored President, has had a wonderful history. Many students from this school have gone out to occupy important public positions. There are advanced schools and colleges belonging to the missions at Fuhchau, Hangchau, Nanking, Suchau and Tungchau, besides many intermediate ones for small boys and girls. There are some seventy training and theological schools, with several medical ones, including ten for the blind and one for deaf mutes.

In addition to these schools there are many philanthropic and charitable organizations, which are the outgrowth of the missions. The Young Men's Christian Association has two or three thousand adherents, with handsome buildings at Peking, Shanghai, Tientsin, Nanking and Hongkong, and there are a few branches of the Young Women's Christian Association. There are Christian Endeavor Societies, Coffee Houses, Free Reading Rooms and Book-Lending Societies for the sailors and others of the working classes. There are numerous temperance organizations and many anti-opium and anti-foot binding societies. Doubtless the Emperor's recent edict prohibiting the practice of foot-binding will be hailed with delight by this latter society. There are industrial institutions which are teaching the young people the domestic arts of the West, and innumerable classes for the acquirement of English.

But that which undoubtedly, above all else, has made the way for the missions are the medical missionaries and the hospitals which they have established. Every educated Chinese acknowledges that his country is behind in the science of medicine, and the American or European physician, whether he comes as a missionary or not, is most cordially welcomed. The gospel of healing is one that makes its own way into the hearts of the people, for suffer-

ing makes the whole world kin, and it can be said without controversy that the medical missionary can enter homes where none of his colleagues can. The Christian hospitals and dispensaries—there are approximately two hundred of them in the kingdom—are revolutionizing the natives' ideas of the treatment for the sick. Particularly is this true in regard to the women of China. Custom prohibits men physicians from any general practice among native ladies. The Christian missions have seized upon this unfortunate fact and have sent many skillful woman doctors, who have been angels of mercy not only at their hospitals but in the inner circles of the homes to which they have been invited. The Mission Hospital at Canton was the first one founded in the country by a mission station. The Government gave the ground upon which it was built, and it has always been supported by the foreign and native residents. Since it opened its doors some ten or more years ago many thousand cases have been treated. The Shanghai Hospital and Dispensary has taken care of more than a hundred thousand patients, and wherever these institutions are located they are crowded with patronage.

The highest class of people patronize these foreign hospitals. His Excellency, the late lamented Earl Li Hung Chang, was a firm friend of medical missions. Both he and Lady Li were treated by the missionary physicians, and from his own purse Earl Li Hung Chang supported the Isabella Fisher Hospital at Tientsin. In Kiu Kiang, Central China, the Elizabeth Skelton Danforth Hospital, the gift of a Chicago gentleman as a memorial to his wife, is almost entirely supported by wealthy Chinese ladies. Two Chinese young women, who were educated at Ann Arbor in this country, are the physicians in charge there, and last year they treated nearly ten thousand patients. The largest and best institution of this kind in Western China is the William Gamble Memorial, exclusively for women. There are ten leper asylums in charge of the missionaries, and several of them which are supported by the Government.

H. E. CHANG CHIH TUNG,
Ruler of Central China

That all of these forces which have been put into play by the Christian missionaries are having an effect on China, no one will deny, and were it not for two things this effect would be felt far more radically than is now the case. First, the vast population of the empire. It would need an army many times the size of that which is now at work to reach her teeming millions. Second, her own, in many respects, admirable educational system. In no other country in the world is there so profound a respect for letters—the inventor of letters in China is enrolled among the gods—and in no other is the education so universally made the test for all political preferment. For the past one thousand years educational competitive examinations have been held, from which, among the successful competitors, all political appointments have been made. The Civil Service of the United States can scarcely compare with this system, which has been in vogue so long. An absolute democracy prevails in regard to these examinations. They are open to every lad in China, with the exception of the sons

of the executioners, actors, butchers and barbers, and possibly one or two others. The lowliest born boy may become the highest mandarin through intellectual effort. Wen Hsing, one of the most brilliant prime ministers China ever had, was the son of a poor farmer.

In China every applicant for official position must be a graduate of the second or third degree of these competitive examinations, and briefly outlined they are conducted something as follows: A Chinese youth enters school to prepare for them at the age of seven or eight years, and it often happens that the old man of seventy is still competing when death overtakes him. For the first degree the boy spends from five to seven years in committing to memory certain canonical books of the Chinese classics and in learning to write the almost in-

H. E. YUAN SHIH KAI,
Metropolitan Viceroy of China and Commander-
in-Chief of China's Northern Troops

terminable Chinese written characters. The test examination for this class is held annually at the Public Examination Houses in the chief cities of the districts. About two million candidates take this examination, and only two or three per cent. pass—a suggestive straw of their severity. The successful

competitors are decorated with the degree, *Hsiu-ts'ai*, "Flower of Talent." The examinations for the second degree are only held triennially, and the competitor for it is examined in the translations of his text-books and in prose and poetical composition. This examination is conducted by two spe-

H. E. TUAN FONG,

Formerly Governor of Shensi, now Acting Viceroy of Hunan and Hupsi, and his two Sons

cial examiners for each province. They are usually members of the Hanlin, who come from Peking to the capital of the provinces, where the examinations take place. Each candidate is assigned to a little room to himself in the great hall, and the test consists of three sessions of three days each, making nine days of the hardest mental labor that can be conceived. Only one per cent. of the examinees receive the decoration, *Chu-jen*, "Promoted Scholar." The third examination occurs, in another three years, at Peking. Those who pass that certainly deserve their degree, *Chiu-shih*, "Fit for Office," but still they

H. E. TSEN CHUN HSUAN

do not become full fledged officials, entitled to the highest honors, until they have passed another examination which is conducted in the palace under the immediate supervision of the Emperor himself. They are then made members of the Imperial Academy at Peking, the Hanlin, and are eligible for many distinctions and the emoluments of civil office the remainder of their lives. But they have earned all that they have won. The severity of these examinations can hardly be comprehended by those who have never attended them.

Without doubt this system of edu-

cation has been in the past of incalculable benefit to China, but now that she is struggling to take her place as a competing force among the nations of the earth many reformatations in it will be necessary and are already being introduced. It is the knowledge of this which has given the mission schools much of their popularity, and has influenced the Government in the establishment in many parts of the empire of schools for the study of Western sciences and learning. The Imperial T'ung Wen College at Peking, of which the brilliant mission scholar, Dr. W. A. P. Martin, was the first President, is an example of this progressive movement in China. The Government gave a large piece of property, an immense estate of one of the Manchu dukes who died without sons, for the school, and has erected magnificent buildings, equipping them with every facility for modern study and research. The faculty is entirely made up of American and English professors. The Government has also issued edicts for the establishment of colleges for teaching Western learning in the capital cities of each of the eighteen provinces, and a movement is on foot to start public schools with like object in many of the larger towns.

All of this shows the trend of the times, but not more so than does that of the influence which the public press is constantly gaining. In the early history of the mission workers in China they made little attempt to reach any but the lowest classes of the people, and did but little along either educational or medical lines.

As has been shown, their physicians and hospitals have brought them in touch with many of the higher classes, and their printed publications are extending their influence far beyond the bounds of their personal work. The Society for the Diffusion of Christian and General Knowledge, one of the mission enterprises, has made itself felt throughout a widespread territory in the twelve or fourteen years of its existence. It has gained the ear of the intellectual classes, and has circulated hundreds of translations of European works on scientific, historical, religious and general subjects. Many of the mis-

sions have publishing houses of their own. The Bible Society of Scotland has sent out from its headquarters at Hankow four million volumes of the Bible, or parts of it. The Presbyterian Publishing House at Shanghai has gotten out more than three million pages in the last five years. The Methodists have a similar establishment at Fuchchau, and all of the other denominations are carrying on enterprises of like character. The Bible has been translated into twenty-six of the Chinese dialects.

That the influence of these things

and that the spirit of the times is very forcibly at work among the Chinese cannot be controverted. The daily paper is a growing power which will only take time to become as mighty an influence there as it is in the Western world. "The sleeping nation," if China ever deserved that title, is awakening. When she is thoroughly aroused and utilizes her great strength, when her boundless resources and her limitless needs are realized and appreciated by the other nations, she will, beyond a doubt, become the dominating Power of the Far East.

WASHINGTON, D. C.

The British House of Lords Waking Up

By Justin McCarthy

THE House of Lords has lately been astonishing the British public.

Of course, it must be allowed that the House of Lords has often astonished the British public before, but then the surprise it gave was of a very different order from that which it has lately conjured up. The House of Lords has often surprised us by its persistent failure to recognize the elementary conditions of civil liberty and equality, and by its failing to understand the pressing need of some reform which the whole untitled community had long since seen to be inevitable and beneficent. But the wonder to the public comes just now from the fact that the House of

Lords has suddenly become the one debating chamber of the British Parliament.

There are questions of the gravest moment just now stirring the mind of the whole British community, and on these particular subjects up to the present the House of Commons has been silent and the House of Lords has been eloquent. My American readers will readily understand that the questions to which I allude are those brought up by Mr. Chamberlain's proclamation of a new financial policy—an announcement of his intention to open up of his own motion a new political campaign. On this subject, of uttermost importance,

THE RIGHT HON. G. J. GOSCHEN

the House of Commons has said little or nothing, and the House of Lords has had several deeply interesting and instructive debates. We rub our eyes, and ask ourselves the meaning of this marvelous change in our political conditions. We have always been accustomed to regard the House of Lords as an assembly having no importance whatever in the life of the State, except for its occasional power to obstruct or to delay the passing of some useful and much-needed measure. The House of Lords very seldom had a long debate of any kind, and when the Peers did indulge themselves in such a debate the outer public hardly ever stopped to ask what the noble lords had been talking about or to glance at the reports in the newspapers next day. Now we suddenly find the House of Lords discussing again and again, with statesmanlike seriousness, the great questions which up to the present have hardly been mentioned in the House of Commons.

What, it may be asked by American readers, can be the reason for this sudden and extraordinary change? The principal reason is that the Prime Minister and most of his influential colleagues do not want to run the risk of breaking up the Government at the present moment, and they feel that there would be every likelihood of such a break up if Chamberlain's program were to be made the subject of a debate in the representative chamber. If such a debate were to take place it must be made apparent that some of the most important members of the Cabinet are totally opposed to the views of Mr. Chamberlain, and it would be impossible for any administration to hold together after such a display of irreconcilable opinions. Chamberlain would have to resign, and then he would stump the country against the Government, or an appeal would have to be made to the voters by a dissolution and a general election, and who can tell what under present conditions might come of such an appeal? The Prime Minister and most of his colleagues, and probably, too, Mr. Chamberlain himself, would rather put off the general election for the present, and they are therefore well disposed to avoid any debates in the House of Commons which might compel them to a prompt decision.

Mr. Balfour and the large majority

of his colleagues who side with him and not with Chamberlain can count for the present on the support of the Irish National party, while the Irish Land Bill is moving on its way, and they know that the Irish party will not force them to any course which might end in the delay of that great measure of reform. Therefore the Government have been doing all in their power to prevent anything from being said on the subject of Chamberlain's fiscal policy, and the Speaker has given them all the help in his power by the most rigorous application of the rules of debate in the Commons to prevent the discussions from ever wandering, even for a moment, to subjects not strictly belonging to the most limited interpretation of the immediate question actually before the House. The Peers, however, have no dread of a general election, seeing that they hold their seats with absolute independence of any popular vote, and therefore even those among them who are most devoted to Arthur Balfour's administration do not feel called upon to maintain a discreet or rather a subservient silence on questions which are talked about wherever British subjects talk about anything, except thus far in the House of Commons.

The result of all this has been that the Peers have had on many evenings vigorous argumentative and really stirring debates, and have drawn to themselves the full attention of the public. Lord Goschen, who during his many years of service in the House of Commons was one of its most influential and powerful debaters, and who since his removal to the House of Lords seemed for a long time to have sunk into utter quiescence, has roused and vivified the indolent House of Lords by speeches worthy of any statesman. Lord Rosebery has been heard at his very best, full of humor and sarcasm, vivid illustration and keen, convincing argument. In these speeches, too, unlike many of his recent public utterances, Lord Rosebery has seemed to see his way distinctly and to commit himself without reserve to the maintenance of a definite principle and policy. The Duke of Devonshire has shown himself for once really interested in the subject under discussion and roused to animation by the force of his own eloquence, and it may be remembered that the Duke

of Devonshire's especial peculiarity as a debater has hitherto, for the most part, seemed to consist in his heroic efforts to keep himself from falling asleep during the delivery of his own speech. Many other noble lords have spoken with an earnestness and an emotion which we hardly ever associate with the debates of the hereditary Chamber, and the general effect has been that we have all begun to ask ourselves what has come over the House of Lords, and what was the magical spell which has thus transformed it without a moment's notice into an assembly of live debate from the somnolent and idle House, which used to meet for half an hour or so of each Parliamentary day, and to mumble out a few brief conversations which the reporters in the Press Gallery could hardly hear and of which the general public took no notice whatever.

It would appear that the spirit-stirring example set by the House of Lords has aroused some leading men on the ministerial side of the House of Commons into a conviction that something must be done if the representative chamber is not to be set down as having retired from the business of debate altogether. Sir Michael Hicks-Beach, who was until lately Chancellor of the Exchequer in the Conservative Government, and resigned his place because he could not bring his colleagues to accept his sound and wholesome doctrines as to the economy of expenditure, has already done his best, altho ineffectually, to extort from the cautious and quiescent Government some opportunity for the full discussion of the whole financial question. "Thank God, we have a House of Lords!" was an exclamation which for many years became a subject of incessant ridicule. I am inclined to believe that there are many even among the more advanced and earnest Radicals of the present day who must feel tempted to declare that we owe some thanks to the constitutional destiny which has just at the present moment allowed us to enjoy the advantage of having a House of Lords. If the recent exploits of the hereditary Chamber should arouse the leaders of Opposition in the House of Commons into something like renewed energy, and should force them to find a definite policy and to act upon it, then we shall all be

compelled to admit, even those of us who are most resolutely democratic, that we have derived some advantage at last from the existence of the House of Lords. This in itself is so remarkable a phenomenon that I have felt compelled to accord to it my tribute of wonder.

We have lately had some literary productions which well deserve the attention of American readers. One of these is a book entitled "The Coronation of Edward Seventh: A Chapter of European and Imperial History." This book is issued by royal command, and is the work of Mr. J. E. C. Bodley, author of that history of "Political France After a Century of Revolution" which lately won so remarkable and so deserved a success in the United States as well as in England and all parts of Europe. I should say at once that Mr. Bodley's work on the Coronation of King Edward is not in any sense whatever a mere description of a court ceremonial. It is a masterly and complete narrative of the evolution of modern English history, and especially of what we may call the Victorian era. Mr. Bodley is one of the ablest students of history and of political life now living, and whenever he turns his attention to any subject he gives to it the fullest and most exhaustive study, and spares neither time nor trouble nor travel for accomplishment of his task. The book which he has just produced is a symmetrical survey of the whole political and constitutional development of England during all that period which followed what may be called the opening of the modern era in the life of Great Britain. At the same time it should be said that Mr. Bodley's work is not merely an exhaustive constitutional study, but is enlivened and made fascinating by many vivid and picturesque descriptions, and its style is everywhere lucid and attractive. The ordinary reader probably does not appreciate or indeed think much about the suddenness of the change which began in English political and constitutional systems after the reign of the Hanoverian dynasty came to an end. Something like a similar suddenness of development was seen in the work of practical science during the same period, and these two simultaneous developments, altho not directly dependent on each other, combine to make the reign

of Queen Victoria one of the most interesting and important passages in English history. Mr. Bodley's book will help every one to understand fully the process of the political and constitutional development, and ought to be welcome alike to the profound student of history and to the casual reader who has yet to be attracted toward a clear comprehension of the whole subject. It may, perhaps, interest American readers to know that Mr. Bodley has traveled much in the United States and written much in English reviews and magazines concerning his observations and his experiences in the realms of the American Republic.

Our novelists are, of course, always busy, and one novel at least has just come under my notice to which I feel much pleasure in directing the attention of American readers. It is called "In the Days of Goldsmith," a very attractive title in itself, and is the work of a countryman of mine, Mr. Matthew Bodkin, a successful Irish advocate and King's Counsel, as the phrase goes which distinguishes the members of the inner bar, and a brilliant journalist. Mr. Bodkin was for many years a member of the House of Commons, and belonged to that Irish National party with which I had so long the honor to be associated in Parliament. Altho busy as a lawyer and as a journalist Mr. Bodkin has found time to write some novels and many short stories, and this latest romance of his seems to me the most delightful that has as yet come from his pen. There is something like intrepidity in the mere construction of the story, for it must be owned that

it is a bold venture on the part of a modern writer to introduce such men as Goldsmith and Dr. Johnson and Burke into his story, and to make us believe that we are really listening to their talk. I must say that I think Mr. Bodkin has been marvelously successful in his attempt, and that the reader will find in this novel some living pictures of the great men whom it brings before us. I have studied the Johnsonian age rather closely myself, and I must say that I have been greatly impressed by the vividness and the general accuracy of Mr. Bodkin's portraitures. If I feel inclined to complain at all it is on behalf of good old Boswell, on whose weaknesses, defects and absurdities Mr. Bodkin seems to me much too severe, while he takes little account of dear old Bozzy's genuine capacity and his many manly qualities. My impression is that Mr. Bodkin has only shown us the comical side of Boswell, and, reversing the action of Phryne's advocate, has thrown a veil over all that was worthy of admiration in his subject. The picture of Goldsmith is, on the other hand, a genuine likeness, giving us the man just as he was, with his weaknesses and his nobleness, his fits of impulse, his impatience and his patience, his courage and his generosity, his odd humors and his loving heart. The whole story of the novel is admirably told, and becomes more and more interesting as the reader moves along with it. Mr. Bodkin's courage in attempting such a work has been well justified and well rewarded by the success of its accomplishment.

LONDON, ENGLAND.

Influence of Men and Women Teachers

By Sanford Bell, M.A.

PROFESSOR OF PEDAGOGY IN MT. HOLYOKE COLLEGE

RECENTLY 543 men and 488 women testified to me concerning the teacher who did them most good. These people received their schooling between the years 1870-1896, in a section of the Middle West where at that time the general distribution of teachers was approximately 41 men to 59 women. All of the men and all but two of the women

had had teachers of both sexes. On the whole, they had come under the influence of more women teachers than men teachers, thus giving the women the advantage in opportunities for doing good. Notwithstanding this, 81 per cent. of the men and 50 per cent. of the women testify in favor of men teachers. The kinds of influences named are such as the

moral uplift and inspiration, the stimulus to the intellectual awakening and the spur to scholarship, help in getting a clutch upon the great vital issues of life, personal kindness, special interest, encouragement at crises, sympathy when things seemed crushing, self-reliance, hints in social graces, etc.

Among the men who testified women teachers had led in none of these influences; among the women they had led only in personal kindness, self-reliance and social help. All through the thousand testimonies is abundant evidence, both in the form of explicit statement and implicit suggestion, that the influence which was felt to be the best was not the effect of subject-matter taught nor disciplinary drill, but the effect of the personality of the teacher. The following are typical expressions: He was my ideal, and I wanted to be like him; he laid the very foundation of my character; he was grand, understood people and could manage them; was masterful—he could do things; he was a noble, dignified leader among men; he was fearless of opinion in doing right; he saw the beauty in everything; he taught me the dignity of duty; he set me afire; I wanted to be the greatest and best man in the world; she inspired me to everything good; by her purity of life; she was so quiet, lady-like and controlled; gave me a taste for the higher, more refined and beautiful life; she was a pure, tender, noble, beautiful, sweet Christian.

With both sexes, the man teacher who had done most good was one who to a high degree was the incarnation of massive strength and masterfulness in relation to vitally significant things. Vigor, courage, independence, fearlessness, ability to do, ability to lead, are the aggressive manly virtues emphasized. Purity, refinement, beauty of spirit, self-control, tenderness, kindness, sweetness, patience are the passive feminine virtues admired in the favorite women teachers. Eighty per cent. of the thousand who testified received this most helpful influence during adolescence. The period of greatest susceptibility for good is at 14 in girls and 16 in boys. This taken, with the above facts, points in favor of men teachers for adolescents. We are not justified in making the general state-

ment that men are better teachers than woman for children of all ages. Up to the age of 9 the child needs mothering, and the tender, sympathetic patience so necessary in giving him his alphabets of life's useful habits. Women are better teachers than men for this period of life. From 9 to adolescence, during which period the individual is breaking away from childish interests and has not yet taken on adult interests, both sexes are equally good teachers. During adolescence the men seem to be the better teachers. During all periods the child needs the influence of both sexes.

The advantage of men teachers for adolescents lies in the fact that the adolescent needs powerful, masterful leaders, and thus far in racial advance men have been the leaders. He feels broadly and keenly the problems of life and his growing strength to meet them. It is the most rapidly formative period of life, when the influence of massive strength and the aggressive virtues are needed. The adolescent is a hero-worshiper for racial as well as for individual reasons. During childhood he learns the necessary automatic adjustments to the general conditions of existence. At adolescence he is inspired to an aggressive mastery over special conditions of existence leading to advance, growth, development, evolution. Twinborn at this time are the instincts to lead and to follow. All racial advance has been made by the leaders of men. He who by power, originality, courage, endurance or ability of any sort could hit upon a better way for himself and fellows survived. On the other hand, those who were able to follow such a leader survived, and others were cut off. These two instincts are not antagonistic, except in their very superficial relations. Both are very powerful in the adolescent. The tendency to follow in adolescents is very different from the tendency to follow in children. The latter is prompted by dependence and helplessness, the former by co-operation and helpfulness. Nearly all genuine racial advance has been made by adolescents. They are fundamentally original until made commonplace by conformity. By nature they are not ready for conformity; they are prophets, not priests. They love power, for

they feel its freshness and significance developing within them. They love the man of power, the man of ability, the masterful man. Such men they need for their teachers. Such men they will follow without artificial inducements. There is no allegiance so whole, so intense, so self-sacrificing, so loyal as adolescent allegiance. The man of power will be their teacher, whether in the schoolroom or out. Him alone will they follow. Him will they follow as long as he is their superior in masterfulness. After that they will be followed. Put such men in our schoolrooms, and in so far as the teacher is a factor our youth will storm doors and walls to get in. At present not enough such men are there. But if the adolescents of both sexes do need the massive strength of masterful men, the example and encouragement of the lead-

ers among men, the influence of the masculine aggressive virtues, they also need the less spectacular but none the less essential influence of the refining, inspiring, beautifying virtues of the leaders among women. Naturally, it seems to me, the more decisive, aggressive influences of men who command admiration and discipleship through genuine manly power should lead during the early adolescent years, and after it has effected the general rugged outline of the youth's character it should be toned and refined and beautified by the influence of noble womanhood.

In conclusion: The women teachers seem best for the period of childhood; both sexes equally right for the period from 9 to 13; men for adolescence. The influence of both is needed for all ages.

SOUTH HADLEY, MASS

Dr. Webb's Country Home

The American Country Estate

By William Frederick Dix

DURING the last few years a new and very significant phase of American social life has been developed. In fact, it is, perhaps, the most significant and important social change since the reconstruction period, and it is a matter of surprise, to any one who realizes its far-reaching influence, how little it has been commented upon and noted—this new love of country life and the consequent establishing of country homes by people who live, for the most of the year, in the city. During the last decade or so there have sprung up all

over the land a multitude of cozy summer homes, cottages and camps, but, more important still, there have been erected an astonishing number of great country estates, consisting of substantial mansions or manor houses, architecturally laid out gardens, specious barns, kennels, chicken houses, farmers' cottages and broad acres of meadows, grain fields and forest preserves for shooting and fishing. In fact, it is stated that there are ten thousand "gentlemen's estates" of ten acres or over east of the Mississippi!

For many years there was a general

tendency toward the cities, and the sons of country or village bred families, finding local life too narrow for their ambitions, fared forth to the cities, there to win fame and fortune in commerce, finance or the professions. They would marry and reside in the city and go back on periodical visits to the old home, which, as the older generation died, would often either be closed and neglected or sold to local tradesmen. Many of these city trained sons of country families, however, would retain their love for and pride in the old home, beautiful in its simple architecture, charmingly furnished in colonial mahogany and dear in associations of the past. Here the old portraits of revolutionary officers in buff and blue, or of stately, kerchiefed dames, would still hang; here the ancient library still exhaled its old-world atmosphere of culture, and here the old-fashioned gardens were still fragrant with iris and hollyhocks and four o'clocks. So, during the summer months, the city bred generation would gather here, tennis courts would be laid out, and the old home would glow again with life. One of the loveliest types of the ancestral village, still unspoiled by the modern spirit, where the substantial and graceful old homes are kept up by the present generation, the men of which have won success in city life, is Litchfield, Connecticut, where, every summer, the homes are filled with the descendants of their founders, and the giant elms nod their plumes over gay lawn parties and modern runabouts and carriages passing up and down the grass-bordered avenues.

This love for the old country home has been one of the influences which has brought about this new love for country life and the building of the new country home. Another is the fact that the boundless energy of the American business man is not yet exhausted when he has won his fortune. He seeks larger interests than his business, his city home, his club and his politics. Another is the result of foreign travel. He has learned to admire the superb country estates of England, France and Germany, and has caught alluring glimpses of the pleasures and dignities of the country squire. So his thoughts wander far from city places into the country, and he dreams of a place

of his own, with wide, cool lawns and blooded horses, fine dogs and a patch of woodland where the quail and pheasant abound.

The result of all this is that there has been a turn of the tide flowing so resistlessly cityward, and a general impulse back to the country. A new architecture has thus come into existence, a new interest in landscape gardening and gentleman farming, stock raising, the preservation of forests and trout streams, the breeding of blooded dogs and cattle, fine poultry, and the application of modern science and enlightenment to the art and pursuit of agriculture. This country quest is of two kinds; first, the quest of the family of moderate means for a cozy country home or mountain or seashore cottage, where, for a few summer weeks, it may lead a simple, healthful life, free from the formalities and mixed society

Some Prize Sheep on Estate of Seward Webb,

of the summer hotel; second, the quest of the family of great wealth for a permanent, substantial country estate, where a part of every year may be spent and where practical work in model farming, dairying, horse raising and cattle breeding may be done. It is with the second of these which this article has to do—with the influence of the great country estate.

The American country estate differs from those of the Old World because it is entirely modern. The country homes of our ancestors are, many of them, still in existence, but, save for Southern ones, such as Shirley, and Brandon, and West-

Beagle Hounds on Mr. W. C. Whitney's Country Estate in the Wheatly Hills, Long Island

over, in Virginia; Drayton Hall, with its famous magnolia gardens, in North Carolina, and so on, they are hardly to be classed as "estates," because, as a rule, they now have but little land. The American estate is, with few exceptions, a thing of modern growth, the result of great wealth on the part of the owner, who calls together his architects, landscape gardeners and engineers, and has it built to order. Such, for instance, is "Harbor Hill," the Long Island residence of Mr. and Mrs. Clarence Mackay, which is an object lesson of unusual import and an example of home building whose in-

the architecture of the chateau-like residence, its Normandy stables and trim farm buildings, mark it as an ideal of the American country home. There is a complete chicken raising establishment with incubator house, large kennels and pretty farmers' dwellings, and tho there are but one hundred and fifty acres of fields and forests, one has perfect seclusion and privacy here. The mansion stands on a hill, the highest point of Long Island, overlooking New York City, the Sound and the Atlantic, and it is a superb structure of Indiana limestone, in the architecture of Louis XIII. Approaching through a formal Italian garden, one passes up marble steps, between carved lions, to the balustraded terrace, upon which the house, nearly three hundred feet in length, stands. The entrance hall is eighty feet deep and forty-eight feet wide, and the ceiling is thirty-eight feet high. The walls are of dark paneled oak and hung with Gobelin tapestries once belonging to the Princess de Segan. The musicians' gallery is supported by columns of verd antique, and the ancient stone fire place was imported entire from a European castle. The *salon* is dainty in the cream and gold of Louis XV. style, the dining room is English Renaissance, with walls paneled from floor to ceiling in oak, and the furniture is of Genoese cherry brocade. The library is

also noble in its proportions, and on the second floor there are no less than six suites of guest rooms, each with two bedrooms separated by a bathroom, housekeeper's, valets' and ladies' maids' rooms, besides the sumptuous apartments of Mr. and Mrs. Mackay, consisting of anteroom, a sitting room, bedroom and bathroom for each. Upstairs are other guest rooms, nurseries, servants' rooms, cedar rooms for summer and winter clothes, and storerooms, and in the basement below the enormous kitchens, brilliant in white porcelain and plate glass, the wine cellars, refrigerators, electrical and heating apparatus.

The country estate which has, perhaps, had the strongest influence is Mr. George W. Vanderbilt's "Biltmore," near Asheville, N. C., which in ten years has reached a degree of development seen only in similar English establishments as the result of centuries' progress. Biltmore is the first great modern estate and comprises one hundred and twenty thousand acres, mostly of woodland. Surrounding the house are beautiful formal gardens and the park, through which are over thirty miles of macadam driveways. The roads are bordered by flowering plants, so arranged that there is brilliant color throughout the year. The house stands upon an esplanade, with fountains, marble walled

pools and formal gardens, and a matchless view is had of the country on all sides. At the left of the house is a broad paved terrace, with parapets and a pavilion, where Mr. Vanderbilt spends much of his time directing the management of the estate, which includes a dairy and chicken yard, truck garden and departments for the raising of fine hogs and sheep. There are conservatories where palms, ferns and flowers reach their highest development, a school of forestry for the culture and systematic preservation of trees and forests; and the little village of Biltmore, occupied by the employees is a model town, being laid out as a unit, with streets, squares and architecture harmoniously arranged, and an object lesson as to what a farming village should be. Biltmore House itself is a masterpiece of architecture. It is 700 feet in length, 190 in breadth and nearly 200 to the top of the highest roof, and it cost over three million dollars. Inside are banquet halls, dining and breakfast rooms, winter gardens, billiard rooms and *salons* filled with rare paint-

ings, tapestries, furniture and curios.

There are twenty-five bedrooms, each with its own bathroom, a gymnasium and a swimming pool fifty feet square.

Another country estate which is a most valuable object lesson to American farmers is "Briarcliff Manor," the Westchester, N. Y., residence of Mr. Walter W. Law. On his ten square miles of improved land he has established a school of practical agriculture and horticulture. He has a herd of over a thousand registered Jersey cattle, which are cared for with scientific cleanliness; flocks of sheep, thousands of chickens and a model dairy. The entire estate is managed with such thrift that it is more than self supporting, and it demonstrates not only what art can do in conjunction with nature in the way of beautiful gardens, parks and the laying out of lawns, flower beds and driveways, but what a master farmer can do for the comfort and happiness of those in his employ. Such an estate as this is the greatest possible inspiration to American farmers, who can learn the application of modern scientific

A Typical Adaptation of the Italian Formal Garden, Showing the Pergolas and Terraces

methods of agriculture and to make the farm not only a successful industry, but a place of beauty.

Similar in purpose and attainment is Mr. Whitelaw Reid's "Ophir Farm," on the Hudson, where his famous short horn cattle and chickens are raised. This is also in Westchester County, New York. Crowning an eminence in the heart of 720 acres of farm land, "Ophir Hall," with its gray battlemented tower, is the home where this distinguished American delights to devote months of each year to the pleasures of the country. Mr. Reid was one of the first gentleman farmers to import Kerry cattle, and the Ophir Farm herd is famous for the rich returns it gives in milk and butter in proportion to the food consumed. The stone dairy is lined with enameled tiles, and its churns and separators are run by electricity. There are three chicken houses, each 90 by 20 feet, where broods of white Leghorns and white Wyandottes are raised and where thousands of broilers are dressed for the market. The monthly consignment of eggs often reaches 240 dozen. Each brood occupies its own wire screened apartment and has its own screened yard for

exercise. Stately turkeys, ducks and pigeons have luxurious quarters, while flocks of snowy sheep roam the hillsides guarded by alert collies. Beside the farm buildings and farmers' dwellings are blacksmith and carpenter shops, electric power houses and tool houses, and the owner is familiar with every detail of the estate and is never so happy as when riding or walking about it.

On the Hudson, just below West Point, is a rambling, white clapboarded country house, with surrounding farming lands, and here Mr. J. Pierpont Morgan raises some of the finest collies in the world. The best trainers, the most scientific diet, a hospital and the most comfortable and sanitary quarters for these beautiful dogs are all found here at Cragston Kennels. Mr. Morgan's agents have paid fabulous prices for such prize winners as "Sefton Hero" and "Ormskirk Connie" and "Rufford Ormunde," and from the best stock of the Old World a finer class of these dogs is bred here to-day than can be found anywhere else in the world.

Mr. A. J. Cassatt's country estate is at Chesterbrook, Pa., and consists of 700 acres, through which are laid out several

An American Adaptation of the Italian Villa

A Colonial Country Home on the Hudson. The Residence of Mr. Ogden Mills, Staatsburg, N. Y.

miles of macadam roads. On these meadows, sown with Kentucky blue grass, roam fine herds of Guernsey cattle and hundreds of noble Shropshire sheep. The breeding of hackneys is Mr. Cassatt's chief hobby, and fifty foals is the average annual production from seventy brood mares. Among the famous race horses which are also bred here is "Gold Heels," the famous winner of many races, and these beautiful animals have had a strong influence in raising the grade of American horses.

The list of these great American country estates is a long one. Long Island, New York, New Jersey and New England are dotted with them. Dr. Seward Webb's sixteen thousand acre Shelburne Farm in Vermont is another striking example. Mr. William C. Whitney, Mr. Foxhall Keene, the Vanderbilts, Harrimans, Astors and many other American families of wealth are spending more and more time each year in their country

places. What a splendid token for the future this return to the country is! The country bred families are growing more and more in touch with the city's life and activity, and the city bred family growing vitally interested in the many phases of life in the country! The sons and daughters of the city man will learn to ride and hunt and roam the forests and to cultivate the acres of his country estate, and find that the best recreation does not mean idleness in some crowded resort hotel, but manly country sport and the study of scientific agriculture, horticulture and arborculture, the improvement of the domestic animals, with the intelligent application of modern science to farming, and grow healthier, broader and saner in consequence. Surely this development of the modern country estate idea is one of extraordinary value and promise to our country and our social life.

NEW YORK CITY

Educational Books : A Brief Survey

IN presenting this brief survey of some of the educational books published during the past year, we would remind the reader that the recommendation of a new book does not necessarily imply that it should supplant some other work already established in the field. It is a fact that perhaps the majority of school books coming from the press have no *raison d'être* except a commercial one, and this applies even to many books, good in themselves, which are yet not distinctly better than what they are intended to supersede. We have attempted in the following notices to call attention to the more deserving work turned out during the year by the teachers of the country and by the educational publishers.

ENGLISH

In the teaching of English it seems as tho what may be roughly called kindergarten methods were growing upon us more and more—as tho the discipline of severe and serious study were to be sacrificed to the pupil's amusement and the teacher's popularity. How much of our grandfathers' superiority in vigor of thought and expression was due to their acquiring a good part of their education through a classic or otherwise sinewy medium, it is impossible to say; but the contrast between such reading matter as they were exercised upon and reprints from the *Youth's Companion* is, be it said with all deference to that admirable periodical within its own sphere, at least a very striking and suggestive one. Under these circumstances it is fortunate that the firms which have already done so much for the promulgation of good literature should continue their services in spite of this momentary aberration. An edition of *THE LADY OF THE LAKE* by Edwin Ginn (Ginn & Co.) has an introductory note on "Classics for Children" with some excellent remarks on this general subject. And in the same spirit, it may be supposed, the Macmillan Company has augmented its Pocket Classics with Shakespeare's *HAMLET* and *AS YOU LIKE IT*, Macaulay's *LORD CLIVE*, Chaucer's *PROLOGUE*, and a selec-

tion of Wordsworth's *SHORTER POEMS*. To be sure all these things are in a sense works of supererogation; they merely do over what has been done already. But when we find a *SELECT POEMS OF COLERIDGE* ably edited by A. J. George (D. C. Heath & Co.), and at least three collections of English poetry, the outlook begins to brighten encouragingly.

Dr. Whiteford's *ANTHOLOGY OF ENGLISH POETRY FROM BEOWULF TO KIPLING* (Benjamin Sanborn & Co.) is a thorough-paced text-book and succeeds in focusing upon the poems quoted a number of cross lights which ought to be instructive to the student, however distracting they might be to another sort of reader. The book, in spite of its general excellence of choice, is a little impaired as a representative of literary continuity by including only a single and brief specimen of the whole period from 1066 to 1340, and as a reader by a trace of pedantry—just a suspicion of the philologist's madness of method and craze for origins. *ENGLISH POEMS FROM CHAUCER TO KIPLING*, edited by Professor Parrott, of Princeton, and A. W. Long (Ginn & Co.), strikes us as a first rate book for secondary schools, to which it directs itself. Without any pretension to completeness it contains a brief sketch of the history of English poetry, a careful selection of material, and a set of brief notes and comments conceived in the literary spirit. For any thorough study of poetry, however, Professor Alden's *ENGLISH VERSE* (Henry Holt & Co.) will be found hereafter well nigh indispensable. The volume is accurate, systematic, scholarly—scientific if one like the word—without being captious, pedantic or otherwise extravagant. It consists of four parts. The first contains specimens to exhibit the principles of English versification, arranged in order of topics; the second illustrates the development of the most prevalent forms of verse in chronological order. The examples are connected by a commentary in smaller type into an admirably concise, and at the same time thorough exposition of metrical theory. Part III includes a discussion of the Time-Element, while Part IV handles the subject of Meter in

extracts drawn from various critics from Aristotle to Professor Gummere. In short, Professor Alden is to be congratulated on having produced a book which is in almost every respect a model of professional scholarship.

When now one turns from these books to those that deal particularly with the teaching of the language, one cannot fail to be struck with evidences of the present ferment and uncertainty prevailing throughout this field of education in the curious mixture of pictures, literature in rather scant measure, and copious and emollient comment out of which many of these volumes are compounded. To this sort of debilitating emulsion *EVERYDAY ENGLISH FOR INTERMEDIATE GRADES*, by Jean Sherwood Rankin (Educational Publishing Company), is a welcome exception. The vehicle is much less flaccid, much more nervous than is by any means usual, and is moreover, we should suppose, really interesting and stimulating to those addressed. Even here, however, one might suggest that the maker of the book is doing a good deal of the teachers' and pupils' work for them. In this connection the attempt to teach grammar, and to some extent rhetoric, directly from literature, as in Manley and Hailman's *ENGLISH LANGUAGE* (C. C. Birchard & Co.) ought not to be passed over without a word of commendation in contrast with the injudicious efforts of the "laboratory" method to excite the student to feverish spasms of "creative" zeal.

Of "histories" and "literatures" the number is small. Among them should be noted especially Dr. McMurray's *SPECIAL METHOD IN THE READING OF ENGLISH CLASSICS* (the Macmillan Company), which advocates very strongly the reading of good literature and reading it entire in its original unabbreviated shape. Such reading, in place of fragments and short selections, might well do something to strengthen the failing sense of form and knit up the relaxing power of concentration which is becoming more of a menace to our civilization every day. The book is rather a discussion for teachers than a text-book proper, and in its recognition of certain slighted truths ought to do considerable good. It insists vigorously upon "the intangible excellence

of superior literature, which defies all exact measurement by the yardstick," and renders futile any substitution of "scientific" method for literary sense and enthusiasm on the teacher's part. And no less vigorously does it insist upon the need of seriousness, of something besides "dreamy, hammock-soothing vacation idling with pleasant stories." In words this may seem a small thing; and yet if even as much as is here suggested could be carried out, it would go near to work a revolution. A *STUDENT'S HISTORY OF ENGLISH LITERATURE*, by W. E. Simonds (Houghton, Mifflin & Co.), is possessed of some very obvious merits. It is lucid, orderly, consecutive, and of marked literary flavor in spite of an occasional latter day flippancy or impertinence, as to speak of "the unavoidable monotony of these unvarying stanzas" in reference to the "Fairie Queen." In a book of this kind there is, of course, no great room for first hand judgments or impressions; and it is no drawback to the work that many of the *sententiæ* are conventional, particularly as they gain an air of freshness in the presentation. But it is a grave defect, for instance, that one should look in vain for any account or even an enumeration of Dryden's substantial services to criticism and English prose. While in addition—and we speak of it the more readily because it is so general a failing—the whole book shows something of that inchoateness which results from trying to carry too many interests at once. Here, for example, are noticeable distinct traces of the historical, the critical, the bibliographical, the literary-pedagogical, so to call it, in questions and suggestions for study, as well as the biographical. This is to confuse things very badly. Why is it not possible, even in a school book, to consider the history of literature as the growth of a certain kind of thought—the kind of thought which results from the general contemplation of life, and to treat it in such a way as to show running through all its modifications and transitions the thread of a continuous development? Let us not, however, lose sight in all this of the positive fact that the book immediately before us belongs among the best of recent publications of its sort.

MODERN LANGUAGES

In modern languages it is easy to see an ever strengthening disposition to the use of current or very recent literature for reading in preference to the classics. In this respect the student of French is much better off than the student of German, for the French language has almost of itself a formative influence which even the German classics seldom possess, while it might farther be contended of Germany that she has produced of late years very little literature indeed worthy of place in school or college curriculum. But, to waive the question which of these two sorts of writing, current or classic, is more agreeable with the aims of education, one of the best German texts of the former sort appears to be Fulda's *DER TALISMAN*, edited with an interesting introduction by E. S. Meyer (Henry Holt & Co.). This little *märchen-drama*, which is a relief from the *plattheit* and *grobheit* of contemporary German realism, is of some significance as having inspired in a general way Hauptmann's "*Versunkene Glocke*" and Sudermann's "*Drei Reihherfedern*" and as partially determinant of the new tendency toward symbolism. But it is even more significant in showing some sort of apprehension of the life of the state, for there can hardly be a worst symptom than a total indifference on the part of literature to public affairs. In this way below its apparent lightness the play contains a ground of seriousness which makes it worthy in so far of the student's attention. The editor, who also does Ludwig's *ZWISCHEN HIMMEL UND ERDE* (D. C. Heath & Co.), has a sense for literary values and influences, and is, perhaps, the best of the year in this field.

Among German classics is to be noted an addition to the numerous editions of Goethe's *EGMONT*, by R. W. Deering (Henry Holt & Co.), with temperate notes and a discriminating introduction, and of *WALLENSTEIN'S TOD* (D. C. Heath & Co.), with an extensive and careful introduction historical and appreciative by C. A. Eggert. Of a rather different character is Lessing's *NATHAN DER WEISE*, by T. J. C. Diekhoff (American Book Company). The book is in-

tended for advanced students, and is equipped with an elaborate and scholarly introduction, which contains in particular an able discussion of Lessing's religious attitude in its bearing upon the drama. The remarks on *Nathan* as a work of art are only less satisfactory, not so much because they differ in several respects with stock-criticism as because of their rather narrow and semi-technical scope. The volume contains a German appendix of illustrative matter. Altogether, the edition is an unusually exemplary one. Another good piece of work is Schiller's *MARIA STUART*, by C. E. Eggert (Scott, Foresman & Co.). It is intended by the publishers to make this the first of a series, which besides supplying the classroom with a number of reading texts, will also through the medium of the several introductions, taken as a whole, furnish a systematic and connected account of the course of modern German literature. In this work Dr. Eggert takes the lead with a very intelligible account of the forces at operation from Klopstock to Schiller. A genesis and criticism of the drama are included, and a small number of judicious notes.

Tho there is nowhere any single piece of work equal to Professor Babbitt's edition of Renan's *Souvenirs*, which appeared last year, it is remarkable that while the general average of workmanship expended upon German texts seems to be rising, the entire output of French this year is very scanty and offers little opportunity for selection. There are among others editions of Augier and Sandeau's *LE GENDRE DE M. POIRIER*, by E. C. Roedder (American Book Company); Cherbuliez's *LE ROI APÉRI*, by Albert Schintz (Jenkins), and perhaps most commendable of all Corneille's *CINNA*, by J. E. Matzke (D. C. Heath & Co.).

In comparison with this meager and rather indifferent issuance of literary texts the increasing supply of commercial grammars and the like practical *hülfsmittel* may be regarded as another sign of the times. *COMMERCIAL GERMAN*, by Adolf Kutner (American Book Company), aims to introduce the student to a knowledge of German by means of a more or less exclusive business vocabulary, and at the same time to afford

through the medium of the readings and other exercises some familiarity with affairs as conducted in that language. FRENCH COMMERCIAL CORRESPONDENCE, by Charles Glauser, arranged and adapted by W. M. Poole (E. P. Dutton & Co.), is a much more elaborate book intended for advanced pupils. Indeed, it is less a gateway to French than a treatise in French on its particular subject graduated to the needs of the English reader. It contains, besides general directions together with the explanation of a few phrases and terms in English, a great number of forms and *fac-similes* of money orders and the like. In a word, it offers, as far as that may be done through the medium of a book, a thorough course of business correspondence in French.

Of Spanish publications the number is much smaller than one would be likely to suppose in view of our present Spanish relations. The lack of a thoroughly good compact practical grammar is still felt. This need of an introduction to the language of life rather than to that of books it is to be feared that Mr. Zägel's translation of Schilling's SPANISH GRAMMAR (Henry Holt & Co.), the only one on our list, will hardly supply—nor, indeed, does it pretend to do so. It is made up in the usual way; and, as it has been very successful in the original and the French translation, it will probably prove useful in its present form to the more methodical literary class of students. For reading texts Galdo's is the favorite author. His MARIANELLA is creditably edited by Professors Geddes and Josselyn (D. C. Heath and Co.), with a biographical sketch, notes and vocabulary; his ELECTRA, which is rather more indicative of his vein, by O. G. Bunnell (American Book Company), with a vocabulary and a few notes at the bottom of the page.

CLASSICS

The volumes of the Twentieth Century Text-Books (Appleton) that have come under our notice are models of what the school edition of a classic should be. The excellence of the paper, typography and material execution generally not only make these books a pleasure to the eyes, but the editors exhibit a thorough acquaintance with modern scholarship in its latest developments,

combined with the gift of being able to present results in such a way as to arouse the interest of the ordinary student.

Professor Westcott's edition of Cæsar's Commentaries (Appleton) contains nothing which is not easily within the comprehension of a boy of fourteen, and yet he has succeeded in keeping the fact in view that the text is something more than a mere exercise in Latin, that it is a historical narrative of great events. The introduction is admirable, bringing into relief the human element in Cæsar's many-sided character, and emphasizing his immense significance as the principal founder of modern civilization. The information supplied with regard to the Roman military organization is given with the utmost simplicity and clearness, and is amply sufficient to render the narrative intelligible to the plainest capacity. The notes furnish just the amount of help the student needs, and do not serve, as in many classical textbooks, as a vehicle for the display of the editor's erudition.

Although there is no royal road to the acquisition of a knowledge of Greek grammar, the road the student has to travel is sometimes rendered unnecessarily difficult by the number of technical terms, consecrated by tradition, he has to encounter on the journey, and by the puzzling confusion of dialectic forms—Attic, Epic, Ionic, etc. In the present work Professor Goodell (Appleton) has been wonderfully successful in the simplification of grammatical statements. He has thrown overboard a number of terms that were not only not descriptive, but actually misleading. He classifies sentences by form instead of by function, and this system undoubtedly renders the Greek sentence more intelligible to young students. Professor Goodell's classification of subordinate clauses—the hardest, perhaps, of all Greek forms to interpret—is at once novel, scientific and easily understood. The chapter on word-formation also merits high praise for its simplicity, thoroughness and lucidity. In short, while the book is elementary, it supplies all that is needed for the study of the dramas and works in Attic prose which are read in the first two years of the college course.

What the general reader, as well as

the student, requires in the history of a particular literature is some definite assistance in comprehending its leading authors and appreciating their works. Doctor Fowler's *History of Latin Literature* (Appleton) satisfies this demand fully. He follows closely the lives of the great Roman writers, and his analyses of their works are, in all cases, able, clear and suggestive, and in certain cases masterly. His estimates of Lucretius, Catullus, Tacitus, Pliny the younger and some others show that he possesses considerable critical acumen. The introduction might, perhaps, have been fuller, and more space might have been given to the explanation of the reasons for the hold Latin literature has on the modern world, notwithstanding its lack of personal initiative and real national character. Doctor Fowler brings his history down to the sixth century, ending with Boethius, whom he regards as the last writer belonging to the old civilization. Indeed, we are not aware of any work on the subject that is so comprehensive as the present one. It is written in a very attractive style, and altho in every way suited to the class-room, it can be read with interest and profit by all who are interested in the great literature it describes. An excellent bibliography completes the volume.

In his work on the *Life of the Ancient Greeks* (Appleton) Doctor Gulick shows that he has profited by the labors of modern archeologists. Important and controverted questions are fully discussed, and the author's conclusions are, in general, acceptable. On the whole he gives us a clear and harmonious picture of Hellenic civilization in its domestic features, altho we fancy the conditions of slave life at Athens are a little idealized. The state of slavery and the relations between husbands and wives, which are very fully detailed by Doctor Gulick, furnish evidence of the contradiction which existed in Hellenic civilization between the ideals of art and literature on the one hand and the cruel realities of life on the other. A book like this is sure to render valuable services to Greek studies. It answers in a very interesting fashion the questions which pupils are so apt to ask. "Who were the Greeks, any way? How did they

live? What did they eat? What were their houses like?"

Doctor Price's edition of the *Laelius* (American Book Company) will be welcomed by students and teachers of Latin. The analysis and summary of the charming little work, which follow the introduction, will prepare the reader admirably for the intelligent study of the text. The editor supplies in the notes all the information needed for the clear understanding of points of grammar, history, biography and those ancient customs to which the author makes reference. The attention of the student is frequently and properly called to the literary character of the essay. The edition will be found excellently adapted for use in the best preparatory schools or during the first year in college.

This edition of Horace's lyrical poems (American Book Company) is unusually helpful and scholarly. It is preceded by an introduction treating of the poet's life and writings, of the meters employed and the special points of syntax. A notable feature in it is the account of the Horatian codices, ordinarily a dry subject, but which Doctor Moore succeeds in making quite interesting. Altho this edition has no scientific pretension, the editor shows himself at home in the labors of modern criticism. The notes are very instructive, and nowhere too much developed for class-room work. The quotations from the poet's Greek models and from his other works will aid the student in appreciating the art and charm of the great lyricist.

The *Æneid* of the late Doctor Frieze has always taken high rank as a textbook, and it is hardly necessary to say more of the present revised edition (American Book Company) than that the changes have been such as the demands of modern scholarship require. However, many important additions have been supplied. The introduction is fuller, and the text has been made to conform to the readings that have become established. The illustrations are, for the most part, new, and have evidently been selected with great care.

There are two features that mark Professor von Minckwitz's edition of these *Ten Orations of Cicero* (Macmillan) for which both student and teacher ought

to feel grateful. The rhetorical emphasis is indicated by the use of italic type for words made emphatic by position or antithesis, and the word-groups are so admirably arranged under their several roots that in the hands of a competent master they must prove an excellent means of enlarging the pupil's vocabulary and of increasing his knowledge of Latin etymology. The first feature is, we fancy, a happy innovation, at least in text-books published in this country. The introduction has a pleasant and well-written account of Cicero's life and personality, and a luminous presentation of the salient points in the Roman constitution. The illustrations, which in most school editions of the classics are necessary, but monotonous, repetitions of familiar sculpture and vase paintings, are here sometimes new and occasionally unusual. The scene in the Senate, with the desperate figure of Cataline cowering in a corner while the Senators shrink from his side and Cicero delivers his immortal invective, will be worth pages of description to a boy of any imagination. The notes are capital, suggestive rather than direct, and compel the student to think for himself. Altogether a fine edition.

The appearance of a new selection from the writings of Ovid (Macmillan) is in answer to a growing demand among teachers for some easier poetry than Virgil's in the earlier years of Latin training. Professor Bain's edition consists of about three thousand annotated verses and one thousand for rapid reading, with brief notes at the bottom of the page. The larger portion of the book is taken from the *Metamorphoses*, and in this the editor has acted judiciously, for their brightness and simplicity are calculated to hold the attention of the young. We notice with approval the arrangement of the word-groups, a very excellent characteristic of the Macmillan Latin series. The notes are clear and apposite, and this edition entirely fulfils the purpose for which it was designed.

Dr. Louis Bevier's little treatise (American Book Company) is not intended to take the place of the more extensive Greek grammars already in use. It aims at giving the student a clear and precise grasp of those fundamental prin-

ciples without which the knowledge of Greek syntax must be vague and general rather than definite and precise. It is a summary of essentials, and will economize the time of the student and also be found useful for purposes of review. *Selections from Latin Prose Authors for Sight Reading* (American Book Company) is also a little book whose value is not commensurate with its size. The passages selected seem well fitted to test and increase by exercise a young student's power to read Latin.

The topics discussed in Professor Johnston's volume (Chicago: Scott, Foresman & Co.) have to do with the everyday life of the Roman people. We have a very full and informing account of the family, of marriage and the position of women, of slaves and clients, and of many other characteristic features which are of interest in themselves and serve in some degree to explain the potency of the influence exerted by that wonderful people on the world. The author says little or nothing about their religious customs, and as religion entered into every detail of their lives, this is rather to be regretted. It is also somewhat strange, for Pauly-Wissowa figures among his authorities, and if Wissowa is anything, he is an infallible authority on the ancient Roman religion. But for all who need a brief, simple and luminous description of domestic life in Rome, we know of no better work on the subject than the present one. It is copiously illustrated, the illustrations are just the sort that do really illustrate, and it makes very pleasant reading. A feature which deserves notice is the references to the standard secondary authorities in English and German. These references will often be found helpful. The author might have indicated the French sources also. They are at least as numerous and perhaps as valuable as the German.

Professor Bonner's work on Greek composition (Chicago: Scott, Foresman & Co.) is divided into two parts, in the first of which the rules of syntax are presented in a concise form. These rules are illustrated by simple examples taken from the more familiar books of the *Anabasis*, examples that can be easily understood by the beginner, which is not always the case in the larger grammars.

The supplementary exercises that follow the exercises based on the Anabasis consist of entrance examination papers of the leading American and Canadian universities, and are liberally annotated. One of the many praiseworthy characteristics of this school-book is the lists of the chief words and phrases in the Anabasis, classified under thirty-nine heads. Every teacher knows the paucity of the average student's English-Greek vocabulary. The effort of Professor Bonner, then, to facilitate the process of memorizing by the association of similar expressions deserves great credit and adds very much to the value of his work.

MATHEMATICS AND PHYSICS

Arithmetic Without a Pencil. By Edith M. Joy. (D. C. Heath & Co.). Good old "Colburn" come again! Well printed, well ordered, well expressed. The weakest part of the little book is the "Foreword." "Foreword" is rather an affectation; "preface" is good English. Affected simplicity is as bad as any other affectation. The statements of the "Foreword" sound well; they might properly preface any good text-book. It is a little startling if one recalls the title of the book to find on page 6 this injunction to the teacher: "Problems should be given whose solution requires the use of the pencil." But the text is excellent. The writer, while not *absolutely* first in attempting "logical, easily progressive, purposeful arrangement," is reasonably successful. The definitions are sometimes vague. "Ratio means relation" (p. 105), does not define ratio mathematically or in any way. A little more would give a clear notion of the term.

The Beginner's Algebra. By Claribel Gerrish and Webster Wells. (D. C. Heath & Co.). This little book completes a full score of titles in Wells's Mathematical Series. These texts are all efforts to meet school demands; many of them are good books. This text seems an acknowledgment that some others in the score have not succeeded. Algebraic processes permeate all advanced mathematics. A discussion of these processes with such practice in their use as will give facility forms elementary algebra. In many cases the line between the ele-

mentary and advanced discussion is either loosely drawn or wholly ignored. The text before us, well arranged, clearly expressed, is nearly adequate as an elementary book. An expansion of Chapter XI to include radical equations and cube root would give a text adequate for ordinary college entrance. The use of "number" instead of "quantity" throughout the work seems objectionable. Algebraic quantities are not always numbers; the larger concept may well be introduced at once in passing from arithmetic to algebra.

Differential and Integral Calculus. By Virgil Snyder and John I. Hutchinson. (American Book Company.) This adds another to the list of "The Modern Mathematical Series," under the general editorial charge of Professor Wait, of Cornell. The high character and ability of Professor Wait as well as the reputation of the authors assure superior excellence. The separate volume on "Differential Calculus" and "Integral Calculus," previously issued in the series, are too extensive for use in ordinary college classes. This text presents the two branches of the calculus more succinctly, and in better form for general class use. The two branches are considered separately. Some recent text-books introduce "integration" prior to the applications of differentials to geometry. There are some advantages in this arrangement. The reverse processes of integration are brought nearer those of differentiation. There are also some students not intending to specialize further in mathematics who wish to gain some knowledge of the simpler processes of differentiation and integration if it can be done without too much sacrifice of time. However, the time given usually in college courses should suffice for the mastery of this text and make a beginning for further work.

The American Standard Bookkeeping, High School Edition. By C. C. Curtis. (American Book Company.) The author of this book has been for many years a successful teacher; the text is an admirable result of this experience. Basic rules of orderly statement are made clear. The illustrations are so put that they cannot be misunderstood. It is made evident that a definite

notion of relations must underlie all formal statements. The distinctions between various books statedly in business are well given. It seems doubtful, however, whether journalizing should be defined as "*the* MENTAL PROCESS of analyzing business transactions and determining the debits and credits thereof."

Elements of Physics—Light and Sound. By Edward L. Nichols and William S. Franklin. (The Macmillan Company.) This Volume III of "Elements of Physics," by Professors Nichols and Franklin, is a new edition carefully revised and enriched by an additional chapter on architectural acoustics as well as by new problems. The subjects with which it deals have been of great interest from the very beginning of physical research. This volume is an exceedingly clear and most attractive discussion of the subject, sufficiently so to be interesting even to one not familiar with the mathematical processes involved. Wherever diverse theories exist the authors seem perfectly fair while expressing preference plainly. The mechanical presentation of the book is most praiseworthy; the diagrams are of adequate size and in every way the work is attractive.

Elements of Physics. By Amos T. Fisher, B.S., and Melvin J. Patterson, B.S. (D. C. Heath & Co.) This little book (180 pp.) does admirably what its writers state of its purpose. It is intended for students having knowledge of elementary algebra and geometry, and its statements are easily within reach of such pupils. Indeed, now and then, oversimplicity appears. The second paragraph of Chapter I in defining "extension" uses, "which occupies space or takes up room;" the alternative is hardly needed. The discussions throughout are admirable. So much physics at least every high school boy or girl ought to know.

GEOGRAPHY

A Teacher's Manual of Geography. By Charles McMurry, Ph.D. (The Macmillan Company.) The Tarr and McMurry Series of Geographies is excellent. This manual, prepared with reference to that series, will largely enhance its value for all teachers who use the manual. Much time and effort are

wasted in the study of geography; pupils are crammed with mere names; details are forced upon the memory with no regard for relations. The methods suggested in this manual should put an end to this waste. They make work for the teacher. But the results will bring ample reward. Geography is one of the "eyes of history" only when the life of history permeates the geography.

A Geography of Commerce. By John N. Tilden, M.A., M.D., and Albert Clarke, M.A. (Benjamin H. Sanborn & Co.) Elementary Commercial Geography. By Cyrus C. Adams. (D. Appleton & Co.) These texts are in response to the demands of our commercial age. While we of this country have pressed to the front in fact, this has been due to individual keenness and energy. We are now begining to prepare systematically for the contest which is so plainly about us. We are doing what has long been done elsewhere. The Department of Commerce at Washington is a response of the general Government. Schools of business everywhere are widening into schools of commerce. Leading universities are realizing that there is matter for thought and teaching in the commercial relations of the world. The two books under consideration are excellent discussions of the productive resources of the world, the routes for transportation and the present condition of trade. Statistics are placed in order for comparison and many charts illustrate the text. The Geography of Commerce has maps of special value showing in colors the areas of various products. It is barely one-half the size of the Elementary Commercial Geography, and has no illustrations merely as pictures, yet seems preferable as a text-bok.

BOTANY AND ZOOLOGY

Introduction to Botany. By William C. Stevens. (D. C. Heath & Co.) The universities of our American West are more and more pressing to the front in contributions to scientific results and in aids to scientific work. Professor Stevens, of the University of Kansas, is one of a group of enthusiastic workers, and his enthusiasm goes beyond his immediate pupils in this Introduction to Botany. A full year's work is provided,

and in this a good foundation is laid for further pursuit of botanic science. The text is in full accord with the notion that to learn how to work is the prime necessity.

Plant Physiology. By George James Peirce, Ph.D. (Henry Holt & Co.) The placing in book form of the lectures of Professor Peirce at Leland Stanford, Junior, University, is a distinct gain for thorough nature study. There is fascination in searching of science toward the ultimate in *life* of whatever form. The position of science is put with great clearness by Dr. Peirce; there is a steadfast distinction held between facts ascertained and theories drawn from them. The treatment, not claiming to be exhaustive, is sufficiently full for the student. Each phase is amply discussed, the questions arise whose answer is beyond the bounds of the work. There is a firm basis for future work; the individual may choose the lines of pursuit.

Studies in Zoology. By James A. Merrill. (American Book Company.) **Laboratory Guide in Zoology.** By Clarence M. Weed and Ralph W. Crossman. (D. C. Heath & Co.) These guides for the study of animal life are clearly the work of good teachers. They do not undertake too much, and the matter given is well presented. Book work, while not decried, is held of little use without laboratory practice, and even laboratory practice is deemed insufficient without a searching in the very home of the life examined. It is recognized that the burden is largely on the teacher, not for knowledge merely, but for direction and enthusiasm. The Guide of Weed and Crossman seems to demand a somewhat more elaborate outfit than that of Merrill, and its arrangement is governed by scientific classification. It presupposes a strong interest in the subjects, and might, unless with an unusual teacher, fail to arouse enthusiasm.

Zoology, Descriptive and Practical. By Buel P. Colton. (D. C. Heath & Co.) There is no lack of aids in book form to nature study. The fancy in this direction, which ran wild for a time, has become subdued, and the study of nature is taking a proper place in school work. Its value in disciplining the power of observation and its use in awakening an

interest in the human environment may be recognized without displacing other matters of importance. Things alive about us arouse more interest than things inert or of the past. Botany and zoology are thus two of the best openings into the workings of nature. Professor Colton's book is a well ordered introduction to the study of animal life. The descriptions are clear and sufficiently full; the practical parts are *practical*. In the use of the book the sequence of topics must be determined by the teacher. The descriptions will excite interest in the laboratory work, and the practical efforts will give point to the descriptions. Only a few of the pupils may continue the work beyond the school stage, but all will have an eye opening glimpse of the workings of life.

Elementary Studies of Insect Life. By Samuel J. Hunter. (Crane & Co., Topeka.) A very handsome book, elegantly printed, profusely illustrated, comes out of Kansas. Perhaps the plagues of that fertile region have stimulated the study of insects. Be that as it may. Professor Hunter, of the University of Kansas, has put forth a most admirable account of insect life, with a clear, practical guide to the work of its study. Such life is everywhere so abundant; its forms are so varied, attractive now by ephemeral beauty and grace, now by very grotesque ugliness, that the young may readily be interested in learning about them. They are also so often persistent foes of human industry that knowledge of their growth and habits becomes of great value.

CHEMISTRY

Elementary Chemistry. By Robert H. Bradbury, Ph.D. (D. Appleton & Co.) **Descriptive Chemistry.** By Lyman C. Newell, Ph.D. (D. C. Heath & Co.) These are two admirable texts; the results of successful experience in teaching, following the same general lines. With the widening of the field of science there has come no lessening of interest in chemistry or of appreciation of the value. Indeed, this branch of science becomes constantly more immediately practical. The chemist is a business man; the chemical laboratories are attached to mines and mills and fac-

tories and warehouses and chemical appliances are found even where laboratories are not. Academies and high schools as well as colleges have well equipped departments, and insist upon teachers especially prepared for this work. The new chemistry must be taught experimentally as well as descriptively, and there is demand for such guides as the texts of Dr. Bradbury and Dr. Newell. They are admirable books. Each brings history to add to the interest of the study. The portraits of eminent chemists enhance the general realm of the books.

Qualitative Chemical Analysis. By John B. Garvin, B.S. (D. C. Heath & Co.) The pupils of the Denver High School have been well taught in chemistry, and Mr. Garvin's little book proves it. It is clear in its directions, the specific problems are well chosen, and the blank pages for results should ward off careless work; errors put down in the book would be shameful; then the work is complete, one-half the book would be the scholar's own. Other teachers may readily follow Mr. Garvin's ways.

Electro-Chemical Analysis. By Edgar F. Smith. (P. Blakiston's Son & Co.) Electricity has become so important as a chemical agent that the methods of its use and their results properly demand distinct treatment. The present text of Professor Smith's work is a third edition of the text issued in 1890. It contains the results of recent experiment, and has been largely rewritten. The general discussion is brief, controversial matters being neglected. The special part giving the processes for determining the different metals comprises nearly three-fourths of the book. The work will facilitate much the teaching and the use of the electro analysis.

Organic Chemistry. By William A. Noyes. (Henry Holt & Co.) Of the mysteries of chemical science the greatest to the ordinary thought are those of the thousands of compounds based upon molecules of carbon and hydrogen and involved in organic chemistry. Even to the chemist their number and diversities are bewildering. Yet they are of vast importance in the arts, and in their formation give ground for many most curious theories. This excellent work of

Professor Noyes gives clear guidance for those who would enter the field.

HISTORY

It is impossible not to be struck by the high average of excellence maintained by the historical text-books issued by American publishers. There are, perhaps, too many of them, but each of them is marked by some distinctive characteristic which would seem to justify its *raison d'être*.

The *History of the United States*, by the late Dr. Kendall Adams and Professor Frent (Allyn and Bacon), certainly needs no apology. It has many features that render it unique, among others the fullness and impartiality with which it presents the Southern point of view in the controversies that threatened the Union, and the attention given to the importance of the West as a factor in the national development. The British aspect of the question in the disputes that led to the Revolution is treated in an impartial and even sympathetic spirit. The American student, however, will hardly be inclined to accept the contention that English statesmen considered the Colonies to be represented because an English member of Parliament was regarded as the representative of the English nation rather than of the county or borough that returned him. Such a broad conception of the English constitution might find room in the brain of a philosophic statesman like Burke, but would have been derided by North and by the great majority of both parties. This work is a witness to the widening of the scope of historical research, that is increasing more and more. The evolution of political institutions and government, and a knowledge of the principles that underlie our national life are given greater prominence than details of battles or anecdotes of public men.

As the *Political History of the United States* (Henry Holt & Co.) has now become a standard work on the subject, it is unnecessary to do more than call attention to certain changes in the present edition. The first issue has been thoroughly revised, and to a considerable extent recast. Dr. Gordy now believes that the dangerous position of the nation at the close of the War of 1812 was mainly

the result of unwise financial legislation, and holds opinions with regard to the treatment of the negro in the North prior to 1830 which a New Englander would find it easier to denounce than refute. Thoroughness in research, sound judgment, entire absence of political and sectional bias, and a simple but vivid and engaging style, explain the favor with which the learned and unlearned have received the work.

Bémont and Monod's *Medieval Europe* (Henry Holt & Co.) takes a very high rank among the text-books used in the French *lycées*. It deserves its reputation; it is a safe guide for teachers and scholars, and will be found deeply interesting by all those who can enjoy, even in a purely educational work, the charms of a work of art. The great ideas and directive tendencies which determined the historical evolution of the Middle Ages, the formation of the feudal system, the strife of Christian and Mussulman, the struggle between the Empire and the Papacy, and the causes that led to the formation of strong monarchies in England and France, are all set forth with wonderful lucidity and force, and bear the impress of that intellectual vivacity which is essentially Gallic. The translator has done her work skillfully, and the notes added by Mr. Adams, who has rewritten most of the sections dealing with literature, enhance the value of the book.

Dr. Robinson's *History of Western Europe* (Ginn & Co.) is primarily occupied with the development of European culture. He has been guided by his conception of the relative importance of past events and institutions, and so his sense of proportion has induced him to leave out a number of personages, episodes and conflicts which are usually found in historical text-books. The space saved by these omissions is devoted to a fuller presentation than usual of the institutions under which Europe lived for centuries and of the lifework of those men who have towered above others in the various fields of human endeavor: Gregory the Great, Charlemagne, Luther, Napoleon, etc. The economic, intellectual and artistic achievements are given even greater prominence than purely political events. The conflicting forces involved in the historical development of

new states out of the ruins of the Roman Empire are summarized in a very effective and masterly style. The chapters on the Medieval Church, the People in Country and Town, the Culture of the Middle Ages, Europe at the Opening of the Sixteenth Century, the Expansion of England, and several others, show that the author, while capable of treating exhaustively and lucidly the more radical problems of society, has also a very vivid perception of its picturesque elements. Of course, many of his conclusions will arouse strong hostility. His contemptuous treatment of Gregory of Tours, for instance, would create a feeling of resentment in any French scholar, no matter to what school he belonged; but, on the whole, Mr. Robinson has succeeded in being judicious and impartial, and, in any case, he is never dull.

The *Essentials of Ancient History* (Wolpon), the first volume of a series prepared under the supervision of Dr. A. B. Hart, claims to give simply an outline of ancient history, bringing out whatever is vital and significant, and omitting all events and personalities that had no definite effect on the movement of the world. The present volume is admirably adapted to attain the end in view. The two series of questions at the end of each chapter, the first of which may be answered from the text or from ordinary compendiums and the second providing for the modern method of research into a wider range of authorities, form an excellent pedagogic apparatus. The summary at the end of each chapter also is a succinct statement of the ground covered by the text, and will train the pupil to think about facts. The book is rich in maps and illustrations, and will form a valuable addition to the text-books used in secondary schools.

General History Way-Marks (Lippincott) is designed to be used with larger texts, such as Meyers, Duruy, etc. The little book is a compact epitome of world-history, and may be found useful. But its utility is marred by some rather queer mistakes. Where did Dr. Boyer discover that Thomas Cromwell was a cardinal? The philosophy of the book is more akin to metaphysics than to history, and there is a surplusage of pseudo-scientific terminology, a fault to

which too many teachers are addicted.

Mr. Mowry's work on the *Territorial Growth of the United States* (Silver, Burdett & Co.) is an extremely valuable contribution to American history, and ought to find many appreciative readers. It is a comprehensive survey of our phenomenal development from 1783 down to the acquisition of the Philippines. The author has availed himself of all the authorities within his reach, and has shown care and scholarship in the use he has made of his sources. The chapters on the Louisiana Purchase and the acquisition of Oregon are crowded with a sort of information which is not generally obtainable, and exhibit a shrewd perception of the underlying causes at the root of these momentous transactions. Mr. Mowry has a graphic faculty of no mean order, and his style is very clear, natural and forcible.

Recent European History (B. A. Sanborn) is concerned rather with the movement toward constitutional government during the nineteenth century than with details of wars and battles. It deals with facts which should be known to every one claiming to be educated, and, as it gives in a compact form an immense mass of information, rather difficult to procure without long researches, it will be especially useful to those whose time is limited. For such a small book it contains quite a number of original and suggestive views, which may or may not meet the reader's assent, but will act as a spur on his intellectual curiosity. It will be found a valuable addition to the text-books of history used in secondary schools.

Instead of introducing the student directly to existing institutions and explaining their mechanism, the authors of *Government* (Silver, Burdett & Co.) begin with an exposition of the general principles upon which all governments are based, and then of the source and growth of free institutions in England and the United States. Abstract principles are defined and made clear by appropriate illustrations, and the development of civil liberty is traced historically from its Anglo-Saxon origin to its completion in the Constitution of the United States. A critical and analytical study of the Federal Constitution follows, and those

clauses which present any difficulty are commented on in the light of the most recent judicial decisions, official interpretations and opinions of leading jurists. The closing chapters are devoted to a comprehensive and lucid survey of the principles of international and municipal law. A student who has made himself master of this little volume will not only be supplied with all the facts and principles needed for the intelligent discharge of his functions as a citizen, but is likely to be impressed by the grave responsibility which the honest performance of his public duties involves.

Bardeen's *Civics* (Bardeen) is intended primarily for New York schools, and therefore the State Constitution naturally receives very full and very minute consideration. The history of the New York Legislature, whose origin may be traced to the attempt of Governor Kieft's Council to form a burgher government in 1642) down to the adoption of the State constitution of 1777, and of its various modifications since that period, is of the highest interest. The book also covers the entire ground indicated by the regents' questions in civics from 1891 to 1901. The numerous cross-references, which actually force the student to have resource to such works of reference as are easily within his reach, are another marked and valuable feature of the volume. The author has made abundant use of Bryce's *American Commonwealth*, and this not only enhances the literary interest of the book, but has enabled him to show that a good many of the features in which the English writer found American institutions defective have been remedied in New York. The book can be cordially recommended as an instrument of political education. It also contains a vast amount of supplementary and very valuable information not usually found in works of the kind, and it is so admirably indexed by headlines that one may turn in an instant to any subject he desires to find.

Professor Webster's *General History of Commerce* (Ginn & Co.) is an attempt to interpret the history of civilization from a commercial point of view. It is a scholarly and practical manual, and fills adequately a vacant space in a very important field of study. The material

available for such a history is of the very highest human interest, and the author has proved his capacity for handling the dramatic elements of his subject artistically as well as judiciously. He shows a keen historic sense, and the order and lucidity displayed in the arrangement of his facts result in the production of finished pictures of the most important factor in human progress in its several stages and phases. The author exhibits entire familiarity with the vast literature which owes its origin to commerce. Every chapter is accompanied by a bibliography of sources; this is of particular value because such a work as the one be-

fore us stimulates the curiosity of the reader, and is sure to lead him to read other narratives dealing with the commerce of particular nations.

The series of *Source-Readers in American History* prepared under the supervision of Professor Hart (Macmillan) will appeal to children of every age and to their elders as well. Some of the narratives are charming and naïve descriptions of the manners and customs of our ancestors by persons who would have been astonished if they had been told that they were writing literature; others are accounts of momentous events by the actors in them.

The King's Friend

By W. H. Woods

KING SOLOMON was old—
The cares of his kingdom weighed on him,
The sins of his children preyed on him,
And his new queen's fancies played on him,
When Solomon was old—
Grown old and sick and sad.

But on a day it fell
That the sick king roused him suddenly
And said to his servants, "Put on me
My crown and my royal robes; and see
That all the heralds tell
The king holds court to-day."

Then feet ran to and fro,
And in the palace was wild dismay;
But none might the royal word gainsay—
They put on him all his rich array,
And, wond'ring, watched him go
Up to his iv'ry throne.

He sat him down, and straight
The old light dawned in the old eyes dim,
The old flush glowed in the old face grim,
And strength and beauty a while to him
Returned. He spake elate,
"Bring to me my best friend!"

"Let the king's will be done!"
They said, but with starts and stares between,
Till a courtier whispered, "Tell the queen;
Mayhap she knoweth what this may mean."
Smiling, the queen said, "Run,
Bring my lord word I come."

She came, with maidens fair,
Whose beauty to hers was leaf to rose,
Or lashes to eyes on which they close,
Or drifting foam to the drifted snows;
But the king, smiling there,
Waved the bright band aside.

They brought his children then,
And many a bearded princeling tall
And wide-eyed, wondering damsel small
Came thronging into the royal hall,
Only to pass again—
Their sire would none of them.

Some hero then they sought;
They hunted for wise men through the town,
For poets, counselors, up and down,
And only to meet the king's slow frown;
Until at last, distraught,
They stood with folded hands.

Then Solomon uprose
And stood on the last stair, eager-eyed,
"Give place, for the king's friend comes!" he
cried;

All turned; on the great hall's further side
Untouched, the gates unclose,
And, with a shivering wind,

A shadowy figure came,
(Some after swore no figure was there—
Some spake of his moonlit eyes, his hair—
And some dreamed long of his kingly air—)
And a thin wisp of flame
Flashed from the king to him.

So on the marble cold
'Neath the ivory throne—the story saith—
The weary monarch resigned his breath
To his last and longed-for friend, King Death—
For Solomon was old—
Grown old and sick and sad.

EDITORIALS

Our Landed Aristocracy

It was once the prevailing opinion that conditions on this continent were so peculiar and its people so unique that the form of society developed here would be entirely different from that which exists in the Old World. This belief, we must now realize, was to a large extent visionary, and, as wealth accumulates and society becomes more settled, we find many features of European life reappearing spontaneously, tho often under new names and incognito. We once thought that our rich men were a new species; hard-headed business men, spending not less than eight hours a day in the office, and furtively figuring on the back of envelopes whenever they were forced to attend fashionable gatherings. Such men, whether we thought them useful members of society or not, certainly could not be regarded as belonging to the leisure class, the patrons of art and science, the conservators of culture and the cultivators of those manners and graces which the less fortunate populace waste their energies in unsuccessfully imitating. It was thought that wealth was meteoric, and that in the absence of laws of entail the incompetent son of the soldier of fortune would necessarily scatter what his father had accumulated, and his grandson be forced to take off his coat and begin at the foot of the ladder.

But we now find that our millionaires are not meteors, but fixed stars, already grouped in constellations. The genius for business seems to be as often hereditary as the genius for art, and we have now an aristocracy apparently not less firmly established than that of Europe, and very similar to it in form. In fact, many of our fashionable families have been in a position of affluence and influence longer than the majority of the English peerage, two-thirds of which have been created since 1820. It was, then, to be expected that they would in time develop in the same way, and the

metamorphosis of the office drudge into the country gentleman, as described by Mr. Dix in this issue, is indicative of this change.

To be sure, the estate of the country gentleman is no new thing in America. On the contrary, except in New England it was prominent among the earliest forms of land tenure. In the region controlled by France the seigneur established his feudal court. In Dutch New York the patroon held sway, having even the right of entail. In the Southwest, leagues of land, measured by the distance a galloping horse could travel in a certain number of hours, were lavished with a royal hand on Spanish dons. To Virginia the Englishman transported his manor and its appanages and here, with the abundance of slave servants and farm-hands, the system resisted the democratic movement, which in other parts of the United States was irresistible and produced the epoch of the homesteader and the squatter-sovereign.

Now it appears the tide is turning the other way, and large farms, either in the hands of single owners or syndicates, with a permanent tenantry, are appearing in many parts of the country. The advantages of the large farm in the greater use of machinery, efficient management and control of the market give it almost the same superiority that the factory has over the home industry, so this tendency toward aggregation of land is powerful from commercial reasons alone, while since it is now being reinforced by the desire of the city millionaire to play the part of country gentleman, it can be expected to prevail more largely in the future over the desire, which some people would have us believe is as instinctive and universal as the desire for food, to be sole lord and master of some little plot of ground.

The destruction of numerous small farms to make lawns, forests and game preserves for the private delectation of the lord of the manor and his friends, in-

volving as it must the closing of roads and various other restrictions on the people in the vicinity, will not be without opponents, both among the believers in greater equality of condition and those whose rights or feelings suffer from the change. Already we see the papers taking up the quarrel of the man whose outlet in one direction was cut off by the encroachment of the Rockefeller estate. The settlers in some parts of the Rocky Mountain region are protesting against the establishment of forest reserves, even by the Government and in the interest of the people, with almost the same vehemence that their Saxon ancestors opposed the opening of the New Forest. Once upon a time five and twenty barons went to their king with arms in their hands to demand that he relinquish his right of afforestation, and since we, too, live under the shelter of the Great Charter then obtained, and have shown ourselves quite ready enough to add any new articles necessary to bring it down to date, there is no sufficient ground at present for anxiety lest the independent farmer be crowded completely out.

On the contrary, since much of this land so far taken up for game and timber preserves in the mountains is unsuited to agriculture, and it is necessary to keep such districts in forests on account of their beneficial influence on the climate and water supply, we may regard these large land owners as doing a public service, which should have been undertaken long ago by the State.

The work done by these estates in stock-breeding and the cultivation of new varieties of plants forms a valuable supplement to the investigations of the agricultural experiment stations which are supported in each State by Government funds. The influence of the great Biltmore herbarium has been felt by plant collectors all over the world. Since in the development of the bicycle, the yacht and the automobile the fads of the rich are often a stimulus to the practical applications of science, so the cultivation of a large farm, considered merely as a form of amusement, is much more profitable to the owner and other people than other pastimes which used to absorb his attention.

The System and the Individual

AMONG a score of profound changes which have revolutionized educational theory and practice within a generation none is more far-reaching in its consequences than the complex organization of the school, college and university system which is now being effected. The primary and secondary schools have been brought into close relations, so have the secondary schools and the colleges, and soon the colleges and the universities will have their respective spheres defined and recognized. The public schools and State universities are looked after by State boards of education, and, in a more general way, by the National Department of Education. Great organizations bring together teachers, principals and superintendents, professors and presidents for discussion and for activity in influencing private practice and State legislation. Altogether it is a vast and intricate affair.

Such organization has its good and its evil side. The number of children and youth to be educated has become very large, and is year by year increasing. Without an expenditure of money in salaries, which the public is not ready for, it would be impossible to handle the multitude of pupils that throng the public schools, and of more advanced students that find their way to the colleges, without an extensive scheme of grading and classification. The number of interests also that clamor for recognition is continually increasing, and some decision must be arrived at as to what ones shall find a place in the scheme of studies; how much time shall be given to them, and by what methods they shall be presented. This fact, taken in connection with the necessity for grading and classification and with the practice of preparing students for many colleges in each school, as well as for one college in many schools, obliges the institutions to "get together" in their decisions and make practically one scheme for all.

The necessity for a complex system, then, is economic and administrative. No one, we think, has ever shown that it is educational. No two minds are quite so nearly alike that the same studies and the same kind and amount of

teaching are equally good for both. The elective system has been faithfully tried at Harvard and elsewhere as a means of overcoming the evils of too much uniformity, but it has its own inherent defects. Few boys of college age can make the wisest combinations of studies without personal guidance, and it is the latter which is of nearly prohibitive costliness.

We continue to hear of the splendid educational results that were achieved by the district school and the country college of two or three generations ago, and much that is said in their praise is entirely true. Their excellence, however, did not consist in the scientific or critical quality of the information imparted. It consisted in a happy combination of discipline and freedom which fostered mental self-reliance. There were classes then as now, but made up irregularly and with much flexibility. The boy kept up or dropped behind, or "entered in advance" very much according to his own abilities. If there had been an effort to impart as much information as nowadays is thought desirable, the plan would have broken down because of the great number of small classes or unclassifiable individuals then recognized. But there was practically no lecture work in those days, and not overmuch explanation by the teacher. The boy was given a book and a place to sit, and told to "get" his lesson. And he got it, if at all, by his own intellectual acuteness or dogged persistence. Such text-book work has its serious faults, and it will not do at all in the higher grades of university study. But it did have this crowning excellence: it left on the pupil's mind the impression that what he obtained in his years of education he owed to his own hard work. He did not leave school with the idea that knowledge could be poured into him by a lecturer or forced into him by a clever cram tutor.

Nowhere is the difference between the method of acquisition and that of absorption more clearly seen in its results than in what used to be called the common branches. Reading and writing, spelling, grammar, arithmetic and geography—these used to be the staples, and boys who claimed to be educated at all were proficient in them. To acquire a clear

and shapely handwriting was regarded as only a decency. The boy who was not fairly good at figures was not in good intellectual standing. The great failure of our complex educational system to-day, as all will admit, is in these common branches. Every summer the newspapers make merry with their paragraphs of English as it is written in college entrance examination papers and doctors' dissertations. The proportion of otherwise highly educated men who are weak also in arithmetical operations is notoriously large, and the late President Francis A. Walker regarded it as the signal disgrace of the present educational era.

Is it not possible to combine in the modern educational plan more of freedom under wise guidance by associating it, as the older schooling did, with habits of acquisition rather than of absorption. Let us release half or more of our professors and teachers from the duty of "imparting" knowledge; break up the too large classes into smaller groups, under the care of the men and women whose time would be saved from the out-giving task. Let the make up of each group be determined not merely by the character of the subject matter studied, but also by the character and mental power of the pupils studying. Let the choice of subjects be as free as is consistent with wise guidance. Let students go from one to another as they are qualified, and the school and college course be long or short for each, as his own make-up and his circumstances may determine. By such changes possibly the advantages of system and of freedom might be secured, with a relatively small proportion of their evils.

Celibate Female Teachers

THE recent decision of Justice Madox in the Supreme Court in Brooklyn that a woman has a right to get married without thereby forfeiting her position as a teacher is a slight check to the prevailing tendency in all parts of the United States to place the education of the young entirely in the hands of unmarried women. But the theory that it is improper for any but maiden ladies to be teachers has become one of the fixed ideas in the

American mind, embodied in the school regulations of many cities and incorporated in the unwritten laws of most of the school boards, so that it will be a long time before it will be rooted out. In the mean time all that can be done is to watch the effects of this curious experiment, according to which the cultivation of the intellect is held to be the peculiar duty of the sex which has been the less distinguished in intellectual achievement, and the training of young men and women for the practical work of life is to be done chiefly by the most immature and inexperienced portion of that sex. Celibate femininity has been the object of reverence, and even worship, among various nations from the remotest antiquity, but no nation before has intrusted to it a practical monopoly of the most powerful instrument for molding the life of future generations.

This custom is doubtless one of the many things which our modern schools have inherited from the medieval church, but we have modified and extended the theory, for now virginity is considered not so much as a state of superior sanctity, but as a pedagogical prerequisite. We have adopted into our public schools the Catholic idea of celibate teachers, but whereas in the parochial schools the instruction of the boys by the sisters is confined to the lower grades, in the public schools few men are found, except in the high schools. It would be interesting to know why women teachers are forbidden to marry, while, except in the case of scholars and fellows in Oxford and some of our Eastern colleges, the men teachers are permitted to marry. One would think that if there were any rights common to both sexes, the right to marry would be one of them.

The Roman Catholic Church forbids its priests to marry. The Greek Church requires them to marry. Which of the two is the better policy to adopt for our public school teachers, if, as seems to be the case, we cannot bring ourselves to consider this a private affair, and not a matter requiring to be regulated by the state? There would be much to say in favor of the Greek in preference to the Roman plan, for an unmarried woman or man is to some extent undeveloped

and rarely possesses that well-rounded and stably poised individuality so necessary in a leader of youth and which is more often attained by those who have lived fuller and wider lives. There is a certain very undesirable attitude of mind which is called "old-maidish," and is with reason so named, notwithstanding that it often survives in married women, and is found in some men, whatever their matrimonial status. Since pupils get much more from a teacher than from what she teaches, it will be interesting to see if our predominately feministic education produces in time any noticeable effects on our national characteristics. Those who have read Professor Münsterburg's interesting essay comparing the German and American school system will remember the emphasis with which he states his opinion that one cause of the superiority of German schools is that the teachers there are mostly men. To be sure others say that the two or three years' gain of the German schools over ours is due to the metric system and phonetic spelling, by which the greater part of compound numbers and spelling, which is such a terror to our children, is made unnecessary; but we must consider all these alleged advantages if we would make our schools as perfect as possible. School teachers are not hired out of charity, and whether a teacher is working to get money to buy chocolate creams, to go to Europe, to get a trousseau or to support an idle husband is none of our business. We must have the best teachers for our children, and if it is proved that celibate females are superior to all others, let us carry out our present policy.

There are, of course, certain very disagreeable occurrences inevitable to this policy. Some teachers hide their marriage certificates in their trunks and continue teaching under their maiden names until, worn in body and shattered in nerves, they are ready to proclaim their change of state. Others continue in the harness until, worn in body and shattered in nerves, they are no longer fit for matrimony. A few, remarkably few, when we think how many thousands of school and Government employees are under this *régime* of compulsory celibacy, fall victims to the temptations incident to the

unnatural conditions under which they are forced to live.

"Down to the pit, or up to the throne, He travels the fastest who travels alone," is the way Kipling expresses the tendency of the times. There is no doubt about the first phrase of the couplet, but the second phrase we still regard as unproved, notwithstanding the traditional belief in the sanctity of celibacy. But, if we disregard the destination, the last line may be true. The army, the navy, the church, the college, the railroads, demand single men in at least some departments of their work. Married women are being shut out more and more from useful employment, and children are not allowed in city flats. It is no wonder if the young man, who is entering on the race of life, decides to discard all such incumbrances as wife and children, which might hinder him from making his best speed toward the prizes he sees before him.

In almost all parts of the United States the tendency is to hire a larger proportion of women teachers for all grades. As a result our normal schools are becoming female seminaries, and people are already coming to look upon teaching, at least of children, as an undignified and improper occupation for a man. Not long since a young man was arrested for wearing woman's clothes. He had been employed as a woman in teaching in the public schools and was doing good work. He was a thoroughly competent teacher, but he had found that it was impossible for him to get the position for which he had qualified himself and do the work he liked, except in disguise as a woman. Now this really is putting our young men who desire to be teachers to a great inconvenience. A woman's dress is neither hygienic nor comfortable, and the bills for shaving must constitute a serious expense. Professor Bell, in an article on another page, shows that during some periods of life a man teacher exerts a more beneficial influence on both young men and young women than a woman teacher. This is interesting, but since it is so difficult for men to get such positions, it cannot be regarded as a practical subject. The teaching profession is apparently to become in the near future a monopoly of female celibates.

The Newly Married

RECENTLY we had something to say on marriages in June, and now that the young people are returning from their nuptial flights to the serious business of beginning upon the honeycomb of their home making, some reflections and suggestions from the old married world will not come amiss. For, if we are not so happy in the age of our adventure, we have more wisdom to support our commonplace content than they have reasons for their honeymoon illusions.

The bridegroom is the only secular man in this world who enjoys a sense of absolute perfection. In a sudden excess of happiness he assumes all the virtues and graces there are and thus establishes a purely romantic relation to Heaven. He is a passing prodigy of himself, a walking beatitude of joy and satisfaction. In short, a person to be profoundly distrusted, not because he is insincere or dishonest, but because he is the lineal descendant of mortal man, not of gods, and is therefore the inevitable heir of a thousand shortcomings. And every bride should be on her guard against accepting this *édition de luxe* of human frailties as scriptural. He is simply passing through a Song of Solomon phase, and may develop into a Jeremiah or become the author of her matrimonial Ecclesiastes before she has done with him. But the shrewdest deception ever practiced is self-deception; and as a rule the bridegroom is so entirely self-deceived as to be absolutely convincing to the bride, who is herself in a frame of heavenly minded credulity, so that his very confessions of faults seem to her the noble prevarications of an over conscientious nature. But really this is his instinctive masculine way of hoodwinking her. For there is no surer way of winning a woman's confidence than for a man to confess himself unworthy of it. His humility magnifies all his virtues and at the same time challenges her credulous generosity to match them with the dove's wings of her maternal tenderness and compassion. It is a characteristic and beautiful way she has of proving her own superiority. For if it is unseemly that she should be the honest and humbly confessed sinner that it is his nature to be, it is her peculiar privilege to show forth

the altogether lovely feminine grace of forgiveness.

But it is one thing to indicate her pretty moral distinction by absolving a new and interesting bridegroom of his bachelor sins, and quite another to bear with the faults of a tried and proved husband. For, once he has worn out the honeymoon hexameter of life, no man is more of the earth earthy, both in his faults and virtues, than the husband. And he can come nearer practicing the commonplace from year's end to year's end than any other creature living. He has long passed the sentimentality of confessing his own frailties, but his wife has no difficulty in detecting them for herself. That is the pity of it. Having settled upon the idealism and spirituality of love, there is a sort of grossness from her point of view in the way he gives up his pretensions to godlikeness. Also, feeling that originally she constituted a large part of the poetry in the situation, she resents the silence of his gallant chorus to her charms. In truth it would be easier to forgive him a sin than this apostacy from the altar place of love. He began with the advantage of admitting his own imperfections and proclaiming her perfections, so that she was indiscreetly led to assume the guardian angel pedestal, only to find that he did not feel the need of a guardian angel often enough to give her much dignity in the office.

Meanwhile the bridegroom has troubles of his own. Being just masculine and nothing more, he lacks the intuition and imagination to comprehend the eccentricities of the female character. He finds difficulty in accepting the paradox that a woman is more intelligent than rational. There is an eternal chasm between her and her mind which even she cannot span. An astute logician often on abstract subjects, she cannot focus her mind analytically upon the riddle of her own nature. And so when it comes to the difficulties of her personal relation with him, what she can be made to think has nothing to do with the matter, but what she feels has everything to do with it! For a woman's feelings are always infallible, so far as she is concerned.

The truth is, when we consider the temperamental differences with which

married people begin, the increasing strength and beauty of the bond as they grow older is altogether admirable. And in view of this fact, newly married people may take courage and understand that their perplexities with one another are not so tragic as they seem.

The solution of the whole matter, so far as it can be stated in general terms, is for the wife to abstain as much as possible from letting her husband know that she has discovered his real imperfections, not the peccadilloes he nobly confessed to, but those perversities of personality which make it so difficult for her to manage him—since nothing so tempts a man to sulk back to the brute level as for his wife to intimate that she suspects his disposition in that direction. On the other hand, the best any husband can do is to interpret his wife according to the symptoms she shows without asking for an explanation that she is incapable of giving. Indeed, his most convenient defense, if he only knew it, is to confess the truth frequently that he does not understand her. When he does that she is bound to forgive him, not because he thus casts the responsibility of mystery upon her shoulders, but she is complimented with the implication that so world-wise a creature as man fails to fathom the depths of her nature and meaning. Few women catch the subtle accusation that they really lack definition.

A careful consideration of the philosophical principles herein set forth as a contribution to the psychology of marriage will, we are confident, do much toward oiling the troubled waters of the matrimonial sea.

An American Park System

ONE of the most wholesome features of that "civic betterment" which is now becoming so popular a topic in the United States is the effort to construct an American Park System. This idea, when fully wrought out, means a series of National Parks, so distributed around the whole country that they shall in some sense be associated; and together shall express what we may term the physical United States. That is, a foreigner might be able to go from park to park, and when he had finished the round he would know very largely

what peculiar as well as what beautiful features make up the American Continent. It is a grand idea to set apart forever such wonderful thoughts of nature as the Yosemite Valley, the Yellowstone region, the Mount Ranier section, as well as those which express calmer moods in the Middle and the Eastern States. John Muir thinks that each one of the Reserves is fitted to different conditions and moods of humanity. But there is one Reserve that nature has retained for herself alone—this includes the Tundras of Alaska—"Undespoilable gardens of the continent. This is nature's own reservation; and every lover of wilderness will rejoice with me that, by kindly frost, it is so well defended."

There are now 5 National Parks and 38 National Reservations—a magnificent realm of woods; unspoiled by man, of whom Muir says:

"This most influential half animal, half angel, is covering the seas and the lakes with ships; the land with huts, hotels, cathedrals and clustered city shops and homes, so that very soon, but for our Parks, we should have to go further than Nansen to find a good, sound solitude."

Most of the wild plant wealth of the East and the West alike has vanished—gone into dusty history. The total area of the present National Reservations is about equal to New York and Pennsylvania combined. The proposed Appalachian Reservation will add largely to this area, and will be of especial value because of the size of the forests rather than because of the novel features and characteristics of our Western Parks.

State Reservations are quite as important as national; but so far anything like systematic work has not been accomplished. In New York we have the Niagara Reservation and the Adirondack Park System; while other pieces of property are held by legislative enactment for patriotic or esthetic reasons. Minnesota and Wisconsin have created a magnificent interstate Park of the beautiful Dalles of St. Croix. New Jersey is preparing to defend the Palisades from injury, and Massachusetts has a Board of Trustees

constituted for the preservation of beautiful and historic places. Minnesota has been authorized by Congress to make a Reserve of the lands held by the Chippeway Indians; on which the Indians themselves should be trained as rangers to protect from devastation the superb forests of white and Norway pine that surround small lakes of unsurpassed beauty. Maine proposes to set apart as Reservations the townships that contain the five Rangeley Lakes, the ten townships that contain Moosehead Lake, with the adjacent mountains, and the twelve townships that hold Mount Katahdin and the beautiful West Branch Lake. No State has a better chance for a system of parks, unless it be California. In Tennessee, in New Hampshire and in Nebraska there are Park Associations which aim to preserve forests, protect scenery and to create parks by tree planting. Connecticut and Michigan have also their Reserves, which are used as experimental fields for forestry commissions. Pennsylvania is perhaps doing more than any other State at present, under the direction and advice of that genius of forestry, Dr. J. T. Rothrock. The State now holds five hundred thousand acres of land under the control of the Department of Forestry. The lands reserved comprise large tracts at the head waters of the main streams, varying from a few thousand acres up to one hundred thousand. The object is to regulate the spread of water; to prevent freshets in spring and droughts in summer.

After the State Reserve, but no less significant, should be the parks and resorts belonging to counties and to towns. Here and there throughout the country are small spots, groves or glens, or brooks, with their adjacent shrubberies, ferneries and rockeries, which should constitute delightful places for public resorts. No county or town in the United States should be without these homes of the people. Most of us know, in our immediate neighborhood, of glorious groves that have been destroyed; and glens turned into guttered wastes, apparently without any cause whatever. The tree cutter is allowed to go ahead of civilized

refinement, until it is impossible for us to restore what his vandalism has destroyed. Instead of the primeval forest, with its wholesomeness, its sweetness and its peace, there remain horrible gulfs, filled with death and shame.

The City Park, or as it soon will be, the city park system, completes our schedule. Of these saving features of city life we do not propose to speak at length. The very best thoughts of the best equipped minds are already turned to the aeration and sanitation and beautifying of our close-built towns. The modern city has few features left of the ancient and medieval towns or tuns—the narrow streets and overhanging houses, as well as surrounding walls and moats, have given way to avenues and trees. We have still to increase the breathing places where traffic becomes a secondary affair, and the shady nooks and rests, until the suburbanized city is only a nucleus of country life.

The park system which we have outlined needs only to be everywhere united by shaded and well kept avenues or public highways to create of America the land of perpetual and universal beauty. The value of the public park and reservation is not as a resort for the sightseer, but as an educator of the people. We are told that Professor Rothrock has so many applications from young men who desire to become foresters that he intends to open a Forest School. Botanical studies and entomological, as well as geological, are quickened from the association of the people with these wild homes of nature. THE INDEPENDENT has heretofore called attention to the very large amount of use of public parks and public gardens that may be made by school children with their teachers. President Eliot says of them that, properly used, nothing can contribute more to public morality and to a high standard of family life. "The pleasures that men share with their wives and children are safer than those they take by themselves. They cultivate considerateness, gentleness and tenderness toward the young and the feeble." The appropriate pleasures associated with the

park system are soothing and uplifting; they separate people from the squalor of the city ant hill, and bring them face to face with things calm, lovely, grand and enduring. Their highest utility is to create a nobler type of American citizenship.

Two Blunders

If the bookbinders' union in Washington had taken wise counsel before proceeding against one of its members who happened to be assistant foreman in the Government's bindery, we are inclined to think that he would not have been expelled. It was expected that Miller's expulsion would be followed by his discharge from the bindery, all the work of which was in the hands of the union. He was removed, it is true, but he has been restored to his place by order of the President of the United States. The result of the union's action is unsatisfactory to the union for several reasons: first, because the President's order virtually makes the bindery and the entire Printing Office an "open shop;" second, because if the members of the union should go on strike they could regain their places only by means of certificates from the Civil Service Commission; third, because this affair, partly on account of Miller's statement and the union's charges against him, has so drawn attention to labor conditions in the Government Printing Office (the largest institution of its kind in the world) that an investigation cannot be avoided. Miller asserts that the union expelled him because he objected to the union's arbitrary restriction of labor output, a restriction which made the cost of binding unreasonably high. The union's formal charges against him confirm this assertion. Investigation will show that from this great Printing Office typesetting machines and other labor-saving devices have been excluded by the influence of unions which have been dominant there. If the unions desired that such conditions should be preserved, they should have prevented a public exposure of them by avoiding such blunders as the expulsion of Miller. The intemperate address of Mr. David M. Parry (President of the National Association of Man-

ufacturers) at the recent convention of the Furniture Association was a blunder of organized capital. In his sweeping denunciation of unions and unionism Mr. Parry showed no discrimination and recognized no merit in the organization of labor. Such attacks are not only unjust, but also unwise. They tend to excite sharp antagonism where conciliation, sympathetic acquaintance and peaceful adjustment of relations should be sought. Nothing can be gained for the cause of the associated manufacturers or for society by the policy which is indicated in Mr. Parry's address.

**A Rejected
Pass**

Mr. Baker, Representative in Congress from one of the Brooklyn districts, has declined an annual pass sent to him by the Baltimore and Ohio Railroad Company. He has taken the right course, altho critical persons have found in the long letter of declination and indignation which he gave to the press some evidence of an excessive desire for publicity. He says to the company that it "has done that which, if not resented, would lay my actions in all matters affecting railroad legislation open to the suspicion of having been corruptly influenced," and that those who have heretofore regarded this railroad corporation "as possibly a victim must now revise their opinion and regard it as an instigator of official misconduct." Commenting upon this, a prominent officer of the company remarks that the offer of a pass to a Congressman is merely "a compliment to the position the man occupies." One very good reason for the rejection of such a pass was not mentioned by Mr. Baker. This reason is that the use of such a pass for free transportation on a road which crosses State boundaries, and possibly the offer of it, is a violation of a law of Congress. This in itself should be enough to restrain a company from offering the pass, or to prevent the acceptance of it by a Congressman. As the offer appears to have been made to many Representatives, probably by other companies as well as by the Baltimore and Ohio, and as this is the only rejection to which publicity has been given, we suggest that the bearing of the Fed-

eral statutes upon this matter should not be overlooked by legislators and railway companies.

**A Vacancy
Should Be Made**

Certain journals representing here what is called in England the Opposition complain because no legal proceedings were begun by the postal service investigators before August 1st against former officers of the Department with respect to whom the Statute of Limitations became effective on that date. They assert that recent disclosures have pointed to irregularities for which Mr. Perry S. Heath, who retired from the office of First Assistant Postmaster-General three years ago, appears to have been responsible. We shall not undertake to defend Mr. Heath, for we find much in his course that we emphatically disapprove; but we are not aware that he has been shown to be guilty of an indictable offense. If there was no evidence against him which was sufficient to engage the attention of a grand jury—and we understand that such evidence has not been found—how could an indictment be reasonably expected? But Mr. Heath should not continue to hold the office of Secretary of the Republican National Committee. If he does not retire by resignation, a vacancy in that office should be created, even if a special meeting of the Committee be required for such action. Mr. Heath is a light and agile person, but in a political sense he is a heavy load for the Republican party to carry.

**The Cause of
Kishineff**

The massacre of the Jews at Kishineff startled the world because it seemed so completely without reason or provocation, and it was difficult for us to understand what led to such a passionate outbreak. To show what forces were secretly at work to arouse the ignorant Russian people we publish below a complete and literal translation, which has just appeared in the *London Times*, of a leaflet distributed among the Christian inhabitants of Kishineff before the massacre. It is such an exceedingly skillful appeal to commercial, race, political and

religious prejudices that it is worth preserving as an example of the way in which the mob spirit can be roused:

"Christians! the great feast of Christ's Resurrection is at hand. Many, many years ago our Savior, who was put to death by the Jews, redeemed by his blood our sins and the sins of the whole world; he shed his sacred blood in his compassion for all the people existing on the earth, for us Christians and for all the men of other creeds; but the infamous Jews, not being satisfied with the blood of the Savior who was crucified by them, who suffered for them, shed the blood of innocent Christians. They take his blood and use it in their ceremonies. Have you not heard that they crucified a Christian boy at Dubosary and took his blood? Yes, this is true, it is known to the authorities, but they have not divulged it in order not to excite us against the infamous drinkers of blood, who ought to have been expelled from Russia long, long ago. The authorities have unwillingly declared that it was not so. The like happened in Kieff a few days ago, where the Jews took the blood of an innocent child and then threw the child out on to the street. Even while we are preparing ourselves for Christ's Passion they drink our Christian blood. Yes, brethren, when one considers how many innocent Christian souls they have caused to perish (eternally) one is filled with horror. In this way this infamous race pours its contempt upon us Russians. Think also of the damage they are doing to our Russia; they wish to take possession of it. They print many proclamations to the people in order to incite them against the authorities, even against our father the Czar, who knows what an infamous, malicious, avaricious race they are, and therefore does not allow them liberty (of action). But under cover of the troubles (caused by them) among the people they seek to gain greater license. Had the Jews a free hand they would soon rule over our Holy Russia, they would take everything, so that it would be no longer Russia but Judea. Therefore, brethren, in the name of our Savior, who shed his blood for us, in the the name of our most pious father the Czar, who cares for his people, who issues manifestoes giving them relief, let us cry on our great festival:—Down with the Jews, kill these infamous degenerates, these drinkers of blood, who even become drunken with our Russian blood. Let them remember the sacking of Odessa (the Anti-Semitic riots of about 20 years back); then even the military helped the people, and they will help us again, as our Christ-loving soldiers have not yet become Jews. Help us, brethren! Kill them, these infamous Jews! We are already many.—The Party of True Christian Workmen." To some

copies of the leaflet was appended the following notice to publicans:—"Give this to your customers to read, or we will destroy your house. We shall know, some of us attend your house."

The Country for Five Dollars

Up in the quiet valleys of Maine the writer recently came on one of the illustrations of "Country Week." "Rosemary" is the name of a large building in the town of Eliot, where mothers and children are allowed an outing from their tenement homes in Boston. Jacob Riis speaks of it as "an introduction to robins and dandelions." Each party is allowed two weeks of this escape from the horror of city life and communication with nature in all her voluminousness of summer expression. It is hardly possible for us to think of children of ten or fifteen years of age who have never seen a meadow, or a bit of woodland, or a brook. Yet it is a fact that thousands of our city children know nothing of these things, except what they learn in school books. A Boston teacher tells us that one of her pupils asked her to describe a brook. She had no better illustration, within the range of the child's knowledge, than a gutter during a shower. Of course, two weeks seems to us a very brief interlude of refreshment, but it will go very far into all the thinking, planning and purposing of the future. Teachers tell us that it has an amazing effect on the studies and intellectual unfolding of the children. They go back with a new furnishing of knowledge, and a possession of facts that will bias all their moral and intellectual unfolding. Too much of this work cannot go on, looking toward that hoped for future when the city will be dissolved into a rational suburbanism. Boston has already created sixty-three retreats or summer homes, besides the reception of many children and mothers by generous hosts who can afford to throw open their homes for a short period. Around New York and Philadelphia these receiving houses for country week are multiplying every year. Five dollars will send to the country a mother with her babe, or a boy or girl. It is a benevolence that should appeal to every man and woman of wealth.

INSURANCE

An Every Day Tragedy

CLARENCE MONTGOMERY HASKELL was spending his well earned vacation at Atlantic City with his wife and two children. He was a small tradesman, who had held his own against even department store competition and had triumphed. He was by no means rich in the sense of the word as now used in Wall Street, but he had a fairly good business, some investments that were considered safe, and his life was insured for \$30,000 in a first-class company. As Mr. Haskell wandered along the famous board walk in the cool of the evening he was at peace with himself and all the world. He looked musingly back upon his early business experience and struggles with a kind of pardonable pride, because he had succeeded where failure is the common lot. He hummed a popular little air in unison with the dull roar that came from the breakers as they dashed high upon the long stretch of sandy beach.

His wife was frugal. His children stood well at school and were well behaved. His business was fairly good, so that as he looked out upon the ocean his cup of contentment was full to overflowing. He saw the moon rise and glint upon the restless water with a mellow light, and he said within himself, "Is not this great Babylon that I have built? Go to, croakers, that would be successful but are not, the fault lies within yourselves. The opportunities of to-day are as many and as great as they ever were. The hand that is not outstretched gathers nothing." Then he took passage in a rolling chair for an hour, and was lulled into a soothing half slumber as the rubber-tired vehicle was gently propelled by the Ethiopian in charge.

The days came and went swiftly, as they always do when they are vacation days. Two weeks at the shore passed only too quickly and Atlantic City became a memory. Mr. Haskell found himself engrossed once more with the details of his business. He strove to buy in the cheapest market and sell in the dearest, according to Adam Smith. He took his business with him in the morning when he went down town, and he

brought it back with him when he came home at night. He lived under its constant shadow.

The tide of his prosperity began to turn through some accommodation indorsements of his; he was unexpectedly obliged to pay the notes of other men which were protested. He began to show signs of wear and tear. He bought some goods about this time that proved to be slow sellers, and in consequence he lost some of his old time boldness. The profits that belong to the merchant whose vision is clear and whose foresight is unerring were lost to him. Little by little his trade that had been his joy and pride began to fall off. New rivals came into the field and competition became knife-like in its keenness. His wife noticed his preoccupation and presently understood the cause. She bravely nursed him. But he was finally overborne by the contest and broke down, and then lost courage and died a victim of nervous prostration.

Mrs. Haskell knew something of her husband's business, as well as how and why it had fallen away. She had been an interested but powerless observer of the contest in which her husband had finally been defeated. She had encouraged and aided him as much as she could. She had counseled him so far as she was able and in so far as the power lay within her she had sustained him in his business transactions. It must be said, however, that she had secretly relied upon the insurance he carried as a support in case of emergency. If this be counted as mercenary, then Mrs. Haskell was mercenary.

* * * * *

The undertaker had performed his melancholy office. The solemn-toned words of the minister had consigned "dust to dust, ashes to ashes." Grief for the husband and father that had been, but was no more, had followed naturally. The widow in her sorrow was yet obliged to take up the burdens of life as best she could at the point where her husband had laid them down. An examination into Mr. Haskell's business revealed complications on every hand, but in her financial difficulties she looked with sustaining

(Concluded on page 1890.)

FINANCIAL

Currency Legislation

IN the early days of the approaching session of Congress the law which prevents the deposit of customs revenue in the banks should be repealed, and with it the statute which restricts the retirement of the banks' bond-secured circulation to \$3,000,000 per month. Differences of opinion and long discussion as to the merits of asset security for circulating notes should not be allowed to delay the action required for the release of customs money when it is sorely needed in the channels of trade. The acceptance of first-class State or municipal bonds as security for deposits should be authorized. These provisions might profitably be placed in a brief bill by themselves, and thus be separated from other projects of currency legislation which may excite formidable opposition and be the subject of long debate.

Imports and Output of Iron

IMPORTS of iron and steel in the last fiscal year were \$51,617,312. Since 1901 the value of such imports has almost been multiplied by three. But this increase has taken place in the face of a remarkable growth of our own output of iron. While the world has wondered at the enormous and increasing product of our iron furnaces, many of our manufacturers have been forced to buy supplies of iron abroad. Thus, altho our output rose from 17,012,315 tons in 1902 (fiscal year) to 18,720,100 tons in 1903, our imports of pig were increased in the same years from 158,000 to 956,000 tons, and the increase of the imports of steel in crude forms exceeded 400,000 tons. The figures for five years past make an interesting table:

	Output of pig iron in tons.	Value of imports of iron and steel.
1903.....	18,720,100	\$51,617,312
1902.....	17,012,315	27,180,247
1901.....	13,821,286	17,874,789
1900.....	14,974,105	20,478,728
1899.....	12,193,398	12,100,440

In only seven years of the last half century were the imports of 1903 exceeded. But in those years our output of iron was small—8,500,000 tons in 1891, about 4,000,000 in 1880-'83, and 2,500,000 in 1872 and 1873. Last year's increase over

the imports of 1902 was mainly in raw or partly manufactured material, pig iron and steel ingots or billets showing an addition of nearly \$20,000,000. The consumption of iron here was, of course, far beyond all precedent. Adding the imports of pig iron and of steel in various forms to the domestic output, we have a total of at least 20,400,000 tons. It should not be overlooked that the rate of production in this country was higher at the end of the year (July 1st) than ever before, and that neither consumption nor imports were declining.

DEPOSITS in the savings banks of the State of New York on July 1st were \$1,112,418,552, showing an increase of \$35,034,000 in six months, and of \$60,729,000 in a year.

....Dividends announced:

Rome, Watertown & Ogdensburg Div., 1¼ per cent., payable August 15th.

Lincoln Nat'l Bank, 3 per cent., payable August 1st.

Southern Pac. Co., various coupons, payable August 1st.

City Trust Co., 4 per cent., payable August 1st.

(Continued from page 1889.)

confidence upon her husband's life insurance policy.

Her troubles came not singly, but as it were in troops and legions. The investments and the estate melted away like snow after her husband's death. She ultimately took the insurance policy from its compartment in the safe and read it, when lo, she found that it, too, was after all only a broken reed that she had so confidently leaned upon, for during her husband's last illness, through the non-payment of premium, the insurance had been suffered to lapse, and under the specific terms of this particular policy nothing remained. Here, therefore, was an every-day tragedy, formerly more common than is the case to-day under the new policy forms now prevailing.

The case of Clarence Montgomery Haskell is, however, by no means unique even in our day, and it contains a great moral lesson as to the mutability of prosperity, and the consequent necessity of keeping the premiums on an insurance policy paid, according to the contract made with the company.

The Independent

VOL. LV

NEW YORK, THURSDAY, AUGUST 13, 1903

No. 2854

Survey of the World

Politics and National Topics

Mr. Bryan has recently been denouncing with more than his customary bitterness those Democratic leaders who are not in agreement with him. At Urbana, O., last week, he said to a large audience composed of the Urbana Chautauqua Assembly and the Democrats of Champaign County:

"The Democrats in 1892 played a confidence game on the people and put a bunko steerer at the head of the party. I want to say to you, my friends, that the disreputable man who stands on the street curbing and leads the unwary traveler into a game where he loses his money is respectable compared with the man who accepts the suffrages of five millions of people and then leads them into Wall Street to be betrayed. Don't be deceived when they tell you it was the silver question that drove people out of the party. Those who left the Democratic party are divided into two classes—those who left because they understood the issue in the campaign and those who left because they were deceived in the issue of the campaign. Those who understood the issue and left because they understood it can never return to the party until they repent and show that their hearts and sympathies are changed. The fight will continue in this country, until one side or the other is triumphant."

Among the other speakers was Mayor Tom L. Johnson, of Cleveland, who remarked that this was no time for "dead issues." He is a candidate for the office of Governor. Two days later, in Kokomo, Ind., Mr. Bryan attacked Messrs. Cleveland, Gorman, Hill and Olney. Senator Gorman, he said, was willing to concede that the Republicans alone could solve the financial problem. Judge Parker had no opinions, or at least had

publicly expressed none. He was confident that Mr. Cleveland would never be nominated again, "but," he added, "there is a fear that some cold blooded fishy creature, standing for nothing but Wall Street, will be forced upon us." The recent decision of the leaders of the two Populist parties to stand apart from the Democratic party is sharply disapproved by Mr. Bryan.—Senator Platt, of New York, remarks that "if it is true, which it is not, that President Roosevelt has no friends in Wall Street, he had better liquidate at once." The Senator sees no necessity for currency legislation.—Congressman Baker, representing a Brooklyn district, who recently published a long letter in connection with his rejection of a pass offered by the Baltimore and Ohio Railroad Company, has declined to avail himself of his privilege to appoint a cadet from his district for the Naval Academy at Annapolis, because he disapproves of anything which savors of preparation for war. He says:

"I most emphatically differ with those who maintain that war is unavoidable. To my mind, it is as morally cowardly for a nation to make such a plea as its excuse for training men to the art of murder as it is for individuals to contend that their honor requires that almost any affront, however trivial, should be wiped out in blood by a duel."

Senator Tillman, of South Carolina, is not one of those legislators who have rejected railway passes. His pocket was picked in Kansas last week, and immediately thereafter notices were posted to the effect that his annual pass on the Burlington road, together with other passes, had been stolen. "How can I help accepting them?" he says. "They

stick them at me until naturally I just have to take them." The Senator has occasionally in his public utterances spoken with much apparent hostility of those who control the railroads.—At the Democratic primary election in Mississippi, Senator Hernando De Soto Money was nominated for re-election. Mr. Money, whose opponent was Governor Longino, had made the race question prominent in his campaign addresses. Education, he holds, cannot make the negro fit for citizenship. James K. Vardaman, who appears to have been nominated for Governor, spoke for a division of the school money between the races upon the basis of the taxes paid by each.—It is reported from Bogota that certain Senators heretofore known as opponents of the Canal treaty are now in favor of it. The consequences of a rejection of the treaty, or of the amendment of it, have been set forth clearly, it is said, in dispatches from Secretary Hay to the American Minister in Colombia. A Panama newspaper has been suspended for six months by the Government for advocating the independence of the isthmus.—A report having been published widely that the Navy Department had decided to prevent the enlistment of negroes for naval service, Acting Secretary Darling disposes of it in the following words:

"The Department does not contemplate excluding the negro from the service. The question has never been proposed nor considered. The Department would not favor taking such a step, and it is difficult to understand how a person otherwise qualified could be denied enlistment on color ground alone."

By promotion a negro became entitled last week to a seat at the petty officers' mess on the receiving ship at the Brooklyn Navy Yard. When he took his seat the eight white petty officers left the table and they have since declined to sit with him.

Mr. Roosevelt's Letter on Lynching

President Roosevelt has addressed to Governor Durbin, of Indiana, a long letter about lynching. Having thanked the Governor for "the admirable way" in which he recently "vindicated the majesty of the law" at Evansville, the President says:

"All thoughtful men must feel the gravest alarm over the growth of lynching in this country, and especially over the peculiarly hideous forms so often taken by mob violence when colored men are the victims—on which occasions the mob seems to lay most weight not on the crime but on the color of the criminal. In a certain proportion of these cases the man lynched has been guilty of a crime horrible beyond description; a crime so horrible that as far as he himself is concerned he has forfeited the right to any kind of sympathy whatsoever. The feeling of all good citizens that such a hideous crime shall not be hideously punished by mob violence is due not in the least to sympathy for the criminal, but to a very lively sense of the train of dreadful consequences which follow the course taken by the mob in exciting inhuman vengeance for an inhuman wrong. In such cases, moreover, it is well to remember that the criminal not merely sins against humanity in inexpiable and unpardonable fashion, but sins particularly against his own race, and does them a wrong far greater than any white man can possibly do them. Therefore, in such cases the colored people throughout the land should in every possible way show their belief that they, more than all others in the community, are horrified at the commission of such a crime, and are peculiarly concerned in taking every possible measure to prevent its recurrence, and to bring the criminal to immediate justice. The slightest lack of vigor, either in denunciation of the crime or in bringing the criminal to justice, is itself unpardonable. Moreover, every effort should be made under the law to expedite the proceedings of justice in the case of such an awful crime."

While no citizen should be deprived of his right to have a fair trial, he continues, men guilty of rape or murder should be visited with swift and certain punishment, and justice should not be delayed or thwarted by mere technicalities. He points out that the community suffers degradation by reason of lynching, especially when the execution is accompanied by torture. "The spirit of lawlessness grows with what it feeds on, and when mobs with impunity lynch criminals for one crime, they are certain to begin to lynch real or alleged criminals for other causes."

"The Nation, like the individual, cannot commit a crime with impunity. If we are guilty of lawlessness and brutal violence, whether our guilt consists in active participation therein or in mere connivance and encouragement, we shall assuredly suffer later

on because of what we have done. The cornerstone of this Republic, as of all free governments, is respect for and obedience to the law. Where we permit the law to be defied or evaded, whether by rich man or poor man, by black man or white, we are by just so much weakening the bonds of our civilization and increasing the chances of its overthrow, and of the substitution therefor of a system in which there shall be violent alternations of anarchy and tyranny."

**Mob
Violence**

In all parts of the North the press is denouncing vigorously and with great earnestness the crime of lynching. Only two lynch law murders of men who had been placed in jail were reported last week. The first of these was committed in Asotin, Wash. Mabel Richards, eleven years old, the daughter of the Sheriff of Asotin County, while on her way to Sunday school on the 2d inst., was assaulted, murdered and mutilated by a young farmer named William Hamilton, who was arrested on the following day and taken to the jail at Asotin. There he confessed; and when this became known, preparations for lynching him were made. On the night of the 5th, a thousand men, some of them from distant parts of the county, assembled in front of the jail. The sheriff had sworn in twenty-five deputies to protect the prisoner, but these appear to have offered very little resistance. Led by men in masks, the mob entered the jail, broke down the door of Hamilton's cell, and marched him to a place where a wire crossed the street from one electric light pole to another. There he confessed again, and then was hanged, with a black hood covering his head. The verdict of the coroner's jury was that he died by the hands of "masked men unknown."—In Hattiesburg, Miss., a mob broke into the jail, took out Amos Jones (a negro who had shot the jailer), dragged him in the street until he died, and then hanged the corpse.—A negro named Garrett, who had been brandishing a razor and threatening several persons with death, in Dublin, Ind., was driven out of town by an armed mob, on the 3d, and into a river, where he was drowned.—On the same day a band of white-cap ruffians attacked a negro preacher named John Millikin, in his house, at

Lewisburg, Tenn., killed him and mortally wounded his son-in-law. For these murders the reports assign no cause.—The Grand Jury at Danville, Ill., has indicted twelve of the men who recently attacked the jail in that place. They are to be tried for defacing and injuring the jail, a penitentiary offense; others will be indicted for rioting and assault with intent to kill. Bessie Armstrong, the woman who urged the mob to kill Sheriff Whitlock, has been arrested. Wilson, the negro whom Sheriff Whitlock so bravely defended with his shotgun, inflicting wounds upon more than thirty persons, and who was held for assault upon a farmer's wife, has pleaded guilty and been sentenced to a long term in prison.—Sheriff Summers, of Iredell County, N. C., has saved from a lynching mob a negro named Roseboro, defending him and placing him in Charlotte jail, where he is held for assault upon, and the murder of, a white woman.—Some one who seeks to defend the good name of Alabama asserts that ten negroes have been executed legally in that State since January 1st, for murder or other capital offenses, while only one lynching has taken place there in the same time. Mob violence is said to have been prevented by prompt trials.—At Henderson, Texas, on Saturday last, two negroes were tried for assaults upon white women. In each case the sentence was 99 years.—On the same day, a mob broke into the jail at Hillsboro, Ohio, intending to lynch a negro named Maynard, accused of assault upon a white child. But the sheriff had taken Maynard to Chillicothe.

**Retirement of
Gen. Miles**

Lieutenant-General Miles, Commanding General of the Army, was retired for age at noon on the 8th, and his retirement was announced by the following brief order of the Secretary, signed by Adjutant-General Corbin:

"The retirement from active service by the President, August 8th, 1903, of Lieutenant-General Nelson A. Miles, U. S. A., by operation of law, under the provisions of the act of Congress approved June 30th, 1882, is announced. Lieutenant-General Miles will proceed to his home. The travel enjoined is necessary for the public service."

Major-Gen. S. B. M. Young was pro-

moted to be Lieutenant-General and assigned by the President to the command of the army until the 15th inst., when he will become Chief of Staff. General Miles had been in active service forty-two years, beginning as a volunteer in the Civil War. The press commented upon the failure of the President to issue an order or letter of commendation, and republished the order in which President Cleveland gave high praise to Lieutenant-General Schofield upon that officer's retirement for age in 1895. The hour of General Miles's retirement was noon, and at 10:30 A.M. he held a reception at his office. He did not cease to be Lieutenant-General until noon, but General Young, who had taken the oath for that rank at 10 A.M., appeared at the reception before 11 o'clock wearing the uniform and insignia of a Lieutenant-General. The date when the General Staff act should go into effect was fixed by Congress at August 15th, in order that the new law should not displace or disturb General Miles, as it was known, of course, that he was to retire on August 8th. It is said in Washington that the Committees on Military Affairs expected that General Miles would be the last Commanding General of the Army, and that no one would be assigned to the command for the seven days intervening before the beginning of the office of Chief of Staff. Therefore the prompt assignment of General Young and his somewhat premature use of the uniform of a Lieutenant-General caused remark. General Miles issued to the army an address which has been generally approved. The 8th was also the date of the retirement of another prominent officer, Rear-Admiral Melville, for sixteen years past the Engineer in Chief of the Navy, and before that term of service well known in connection with Arctic expeditions.

The Case of Mr. Littauer

The evidence relating to the contracts in which it was alleged that Congressman Littauer had an unlawful interest was submitted to Judge-Advocate-General Davis, who reported that "a case falling within the prohibition of the statute is clearly shown in the testimony." This opinion was based upon the agree-

ment between Littauer Brothers and the contractor, Lyon, for an even division of the profits on a contract for gloves, awarded to Lyon on December 7th, 1898. General Davis recommended that the Department, as required by law, should demand from Littauer Brothers a repayment of the sums paid under that contract, but should first obtain the opinion of the Attorney-General. Commenting upon General Davis's report, Secretary Root says:

"There appears to be no evidence that in the manufacture of gloves by the Messrs. Littauer Brothers to be used in filling Government contracts made by Lyon and others there was any violation of the statute except in one case, the contract of December 7th, 1898. . . . I think the indications of an interest by the manufacturer in the jobber's contract with the Government are sufficient to require me to proceed upon the theory that there is a *prima facie* case of violation of the statute. . . . No influences and no motives except a desire to attain the best interests of the Government appear to have operated upon the officers of the army in the transactions."

The question of legal proceedings has been referred to the Department of Justice, and Inspector-General Garlington has been directed to continue the investigation in order that the testimony of certain persons who were not found may be procured. The testimony submitted by Colonel Garlington includes letters written in November, 1901, and July, 1902, to the President by William T. Keck, a glove manufacturer of Johnstown, N. Y., who virtually asserted that Mr. Littauer—"who claims," said Mr. Keck, "to be your closest adviser in Government affairs"—was unlawfully interested in glove contracts. Keck asserted that Mr. Littauer expressed a desire to control his bids, for a consideration, in order that awards should be made to others. It is shown that a glove contract with Daniel Hayes & Co. was canceled in June last because the bondsman for it was Mr. Littauer. The latter publishes a statement in which he expresses surprise at Mr. Root's "decision that there may exist even a *prima facie* case of violation of the statute," and adds: "I can ask no more sweeping and complete vindication of my

honor and business integrity than the findings of the Secretary."

Our Pacific Islands

The capital of the Moro Province, over which Gen. Leonard Wood will rule, is to be at Zamboanga (island of Mindanao), and four of the five districts of the province are on that island. The fifth includes the islands of the Sulu group. Under the new law Governor Taft appoints the Civil Governor (who may also be the Commanding General of the Department of Mindanao and Sulu), an attorney, a secretary, a treasurer, a superintendent of schools and an engineer. The Provincial Governor may suspend any district officer for misconduct or incompetency, and he is to appoint all the subordinate officers and employees under the provisions of the Civil Service law, except such employees as are paid from special appropriations for public works. These are to be appointed and employed as the Legislative Council may direct, but in no manner inconsistent with the Civil Service statute. This Council, consisting of the six appointed officers mentioned above, will make laws for the Moro country. The Governor's salary is to be \$6,000, with an allowance of 20 per cent. of his yearly pay as an officer of the army and the actual and necessary expenses incurred while he is absent from his station in the performance of civil duties.—The Philippine Commission has temporarily disposed of the opium problem by appointing a commission—composed of Surgeon B. C. Carter (Commissioner of Public Health), Bishop Brent, and Dr. Albert—to study opium conditions in Japan, China, Singapore, and Burmah, and to report within four months.—In Hawaii the political hostility of the natives toward the whites is clearly shown. Their leaders say that the natives will hereafter stand together in opposition to the whites. They object to appropriations recently made for good roads, saying that neither hard roads nor sidewalks are wanted. It is said that the Federal Grand Jury will inquire concerning the expenditures of the House during the recent session. The Committee on Expenses, composed wholly of natives, declined to make a report, a resolution calling for a public statement of the

expenses was voted down, and the vouchers were not, as the law requires them to be, deposited with the Territorial Secretary.

The Cuban Army's Large Claim

Gen. Maximo Gomez, chairman of the commission that has just completed a list of the revolutionary soldiers entitled to pay, says that the proposed loan of \$35,000,000 will not cover more than half of the claims. The number of soldiers on the list is about 53,000, and it was estimated, as we said last week, that the sum required for these would be \$45,000,000. But no civil employees were included, and the revising commission has power to add the names of soldiers, but not to take any away. Some surprise has been expressed in this country because the Gomez commission allowed to the soldier in the ranks the high rate of \$1 per day during his period of service, which in a majority of cases is fixed at two years and a half. The sum due, therefore, to a private is in most cases about \$900. Officers are to be paid at much higher rates, and General Gomez himself is to receive \$20,000. He remarks that the total much exceeds the commission's expectations, but adds that the claims were carefully examined and that the allowances are undoubtedly just. The Cuban Congress, he thinks, after using the proceeds of the loan, will provide for paying the remaining sums still due by notes bearing interest and payable some years hence. Others say that the soldiers will be satisfied with the proceeds of the loan and will not insist upon subjecting the republic to the burden of an additional debt. No steps have yet been taken for the negotiation of the loan of \$35,000,000. The work of borrowing the money may be made more difficult by the statement that \$20,000,000, or more, in addition will be needed to pay in full the claims of the soldiers and civil employees.

The New Pope

After being in session for four days the conclave of cardinals unanimously elected Giuseppe (Joseph) Sarto, Patriarch of Venice, to be Pope in succession to Leo XIII. During the earlier ballots Cardinal Rampolla led, but the partisans of Cardinal

Vannutelli and others were strong enough to prevent his obtaining the necessary two-thirds majority. It is said, on what seems to be good authority, that the Emperor of Austria by a direct telegram exercised his right of veto at a crucial moment when it looked as if Rampolla would gain the required votes. As it became apparent, however, from the successive ballots that neither of the prominent candidates could win, the vote for Cardinal Sarto grew constantly larger. On the sixth ballot he received thirty-seven votes, the whole number needed being forty-three. At this the cardinals crowded about him and compelled him to declare positively whether he would undertake the charge, and with reluctance, which was no doubt genuine, he replied, "I accept." At the next vote, which was cast about an hour before the noon of Tuesday, he was finally elected. He announced his name, Pius X, immediately, before he was taken to the sacristy to be vested with the pontifical robes. About three-quarters of an hour after the ballot Cardinal Macchi appeared at the great window of St. Peter's facing the piazza and announced the election in the ancient formula:

"Annuntio vobis gaudium magnum. Habemus papam eminentissimum ac reverendissimum dominum cardinalem, Joseph Sarto, qui sibi imposuit nomen Pium X."

Whereupon the bells of St. Peter's sounded out and the other bells of Rome answered the tidings. So it happens that Cardinal Sarto, who left home with such little expectation of becoming Pope that, as he said, he purchased a return ticket to Venice, remains for the rest of his life a voluntary prisoner in the Vatican.—On Sunday, August 9th, the new Pope was crowned in St. Peter's, which has not been the scene of such a ceremony since 1846. No tribunes had been erected, and the vast crowd of people had to stand for many hours waiting for the appearance of the Pontiff. The ceremony was impressive, but accompanied by so much noise from the onlookers that the Pope was visibly distressed. Part of the proceedings were very quaint. Thus at one time the master of ceremonies knelt three times before the Pontiff, lighting a handful of hemp and then extinguishing the flame with the solemn words (in Latin):

"Holy Father, thus passeth the glory of the world!" At the shrine of St. Peter, while the whole Sacred College chanted Palestrina's "*Corona Aurea Super Caput Ejus*," Cardinal Segna raised the Pontiff's mitre and Cardinal Macchi placed the triple crown on the head of the new sovereign of the Church.

The Insurrection in Macedonia It seems the long anticipated rising in the Balkans has at last taken place, altho its power and extent cannot yet be determined. The Macedonian committee from their headquarters at Sofia have issued the following statement of their purposes:

"The object of the rising is to win reforms which will assure to the Christian population of Macedonia security for their lives and property and the right to take part in the administration of the country. The present revolutionary organization came into existence nine years ago, when the persecution of the Bulgarian population of Macedonia became flagrant. To-day all Macedonia is embraced in the movement, and tho it was not intended to strike so soon, because the preparations for the uprising were not sufficiently completed, the recent outrages of the Turks, the massacre of innocent persons, the filling of the prisons with the peaceful rural population, the pillaging of entire villages and the extorting of heavy fines from others, under various pretexts, so exasperated all that the insurrection was decided upon, no matter what might be the outcome. The fighting area is widening, and will gradually embrace every vilayet in Macedonia, until the autonomy of the country has been gained by force of arms or by the intervention of those great Powers which desire peace. Not until then will we lay down our arms. Nothing can end the present revolution in Macedonia until our national aspirations are satisfied or those fighting to attain them are exterminated."

Numerous predatory bands of Bulgarians and Macedonian insurgents are burning the Mussulman villages, dynamiting bridges and telegraph offices, destroying crops and murdering peasants, while the Ottoman troops are authorized by the Porte to use the severest measures to suppress the threatened rebellion. The Turkish soldiers, many of them reserves and regulars who have not been paid for five months, are deserting in large numbers and selling their arms to the revolutionists. So far the Bashi-Bazouks and

Albanian irregulars have not been employed, doubtless for fear of interference by the Powers in case of the terrible outrages on the Christian population which would almost inevitably result. The town of Krushevo, twenty-three miles north of Monastir, was captured by the insurgents and held for two days. The Governor's palace and other buildings were blown up. The town was recaptured by the Turks after severe fighting. Near Sorovitch 1,200 revolutionists were routed by five battalions of Turkish troops with artillery. The country around Kastoria is dominated by insurgents said to number 10,000, and the same number are reported around Monastir. A perplexing factor in the situation is the ability and willingness of King Ferdinand to restrain the Bulgarians from taking an active part in the insurrection and so bringing on a war with Turkey which might set all Europe on fire. A large number of the officers of the Bulgarian army are Macedonian immigrants and most of the people are giving sympathy and support to the Macedonian movement. The murder of the Russian consul, M. Rostkowsky, at Monastir, by a Turkish sentinel, will complicate matters since it follows only a few months after M. Stchesbina, the Russian Consul at Mitrovitz, was also murdered by a Turkish soldier.

Russian Labor War

The Russian papers have been allowed to publish only a few insignificant items on the strikes and riots occurring in many parts of the Empire, but from the fragmentary reports through various channels it is transpiring that the disorder has assumed serious proportions. It is estimated that 200 strikers have been killed and 2,000 wounded in the past month. Kieff and Odessa are yet under martial law, and railroads and street car lines are only kept open by Cossack patrols. The damage by fire due mostly to incendiaries in twenty-four of the largest towns in Russia during last month amounted to some \$30,000,000 or \$35,000,000. Owing to the interference with transportation provisions have failed in several cities, and attacks have been made by the mobs on the bakeries and the Governmental spirit shops. At Nikolaieff, in

a riot of factory hands, the Governor was wounded in the head, but declined to permit the troops to fire and succeeded in restoring order without further bloodshed. Twelve had been killed and 200 wounded on the previous day. A settlement by compromises on both sides is reported to have been made at Odessa. The strike in the petroleum region of Baku began on July 15th by demands for increase of wages, an eight-hour day, the abolition of the system of fines and stricter enforcement of the factory regulations. There were some 45,000 strikers and only 600 troops. The oil wells were set on fire, the city deprived of light and water, and for ten days the trains were stopped and no newspapers were published. Soldiers to the number of 6,000 have now been brought in, the tumult is quelled and numerous arrests made. Religious and race prejudice have here as elsewhere in Russia aggravated the feeling, since much of the oil property is owned by Jews.

Hungarian Premier Resigns

Count Khuen Hedervary has offered his resignation, and it is reported the Emperor has accepted it and has asked M. de Szell to resume his former position and form a cabinet. This completes the triumph of the Obstructionists, who since the exposure of the attempt to bribe one of their number in the interests, altho possibly without the knowledge, of Count Hedervary, have been joined in steadily increasing numbers by the members of the more moderate wing of the Independent party under Franz Kossuth, who was willing to accept the concessions offered by the Government.

Religious Census in Germany

The German Government has just published the full report of the religious census taken some time ago. According to this the Protestants number 35,231,104, or 62.5 per cent. of the total; the Roman Catholics 20,327,913, or 36.1 per cent. of all the inhabitants. In addition there are 203,793 "other Christians"—*i. e.*, Methodists, Baptists, Irvingites, etc., and 586,833 Jews, the latter constituting 1 per cent. of the population. Thus near-

ly two-thirds of all Germany is Protestant and a little more than one-third Roman Catholic. It is particularly interesting to note that, notwithstanding the fact that educated Germany has again and again been declared to have broken with Christianity, there were, outside of the Jewish contingent, only 5,938 persons in the whole Empire who declared that they were not Christians. Altho Social Democracy is determined in its opposition to the Church and to Christianity, it has not been able to induce its adherents to break with the State Churches, altho naturally hundreds of thousands who have enrolled themselves as Protestants or Roman Catholics are only nominally adherents of these churches. Neither of the two great churches has made material gains or suffered serious losses since 1871, when the Protestants had 62.3 per cent. and the Catholics 36.2 per cent. of the population. In 1880 the figures were 62.2 per cent. and 35.9 per cent.; in 1885 they were 62.7 per cent. and 35.8 per cent.; in 1890 they were 62.5 per cent. and 36.1 per cent. The Jewish contingent has gone back from 1.3 per cent. in 1870 to 1 per cent. now. North Germany is the stronghold of Protestantism, in many places the percentage being 98 and 99, while South Germany, the Rhine districts, and especially Alsace-Lorraine, are predominantly Roman Catholic. The most Catholic country is the little province of Hohenzollern, with 94 per cent. of its population members of that church.

Anti-Woman Crusade in European Universities

There can be no doubt or debate that a decided movement not only against granting women further privileges at the universities of Central Europe, but even in favor of curtailing the rights they have enjoyed in this respect, is becoming general. A number of institutions have taken drastic measures in this matter and the result is seen in the small enrollment of this contingent reported for the present semester. Only about eighteen months ago the number of women in the twenty-two German universities was

about 1,400; last semester it had been cut down to 1,271, and the present summer term reports give a total of only 850. The cause of this decrease is chiefly the fact that the authorities of the Prussian universities, notably those of Berlin, have made the conditions for the entrance of women more stringent, resulting in Berlin losing almost one-half of its contingent, the decrease being from 560 to 293 in the single half year. This anti-woman crusade did not originate in the universities but in the Polytechnic schools, and has been pushed rather by the student body than by the teaching corps. It is directed chiefly against insufficiently prepared women from Russia, notably Jewesses, and the majority of German universities have decided to admit no candidates who have only a certificate of graduation from a Russian Women's Gymnasium. No other state has shown the slightest inclination to imitate the example of Baden in admitting women to matriculation and examination in the two territorial universities of Heidelberg and Freiburg. Rather singularly the number of women at these institutions is small, only 92 in the former and 22 in the latter; but these two are the only universities in the country that have an increase of women to report for the summer term, except Kiel, which now has 17 as compared with 14 last term. In the three most orthodox universities, the Lutheran Rostock, the Evangelical Greifswald and the Catholic Münster, there are now no longer any women, and in all other universities there is a decreased attendance, a total of some 900 in the nine Prussian universities having been reduced to 529. Breslau has gone back from 114 to 61; Königsberg, which now excludes women from the medical faculty, from 59 to 33; Marburg, from 20 to 9. As matters now stand the governments do nothing at all in the question, each university being permitted to work out its own salvation in this regard. All these facts and data indicate a reaction that is even more pronounced in the Polytechnic institutes than in the universities, and has crowded out the foreigner more successfully in these younger institutions than the conservative university authorities have done.

Pope Pius X

By the Reverend P. J. Hayes

PRIVATE SECRETARY TO ARCHBISHOP JOHN M. FARLEY OF NEW YORK

[Archbishop Farley would not consent to be quoted at this time, because of the presence in this country of a superior, the Apostolic Delegate, who has not yet spoken. However, his mind is expressed in the following interview, given to a representative of *THE INDEPENDENT*.—EDITOR.]

ARCHBISHOP FARLEY'S acquaintance with Cardinal Patriarch Sarto—who has become his Holiness Pius X—was made in November, 1901, when the Archbishop called upon him in his Venetian palace and had a half hour's interview.

The impression that he then made on the Archbishop was that of a very likable, human man, fond of his fellow-creatures and understanding them. He made his American guest at home with him in an instant and they fell to discussing those things that were nearest their hearts.

The Archbishop told the Cardinal Patriarch all about our wonderful ideal Catholic parish, St. Gabriel's, of which the Archbishop was then the rector. He was greatly interested in the St. Gabriel's parish schools, which educate 1700 children a year; the parish, with 13,000 communicants, and the entire scheme of work.

In return Patriarch Sarto informed the Archbishop about the St. Vincent de Paul Society of Venice and the work it was doing to improve the lot of the poor in that city. He knew all about it. It was a matter in which he personally labored, and with the details of which he was perfectly familiar. This struck his visitor as uncommon, because there is a strong tendency in men of such exalted rank to lose sense of the importance of the human unit. Not so with Cardinal Patriarch Sarto. Tho the large affairs had come to him to be done, he still had tenderness and interest for the little things and the little people. In other words, he is a true democrat, and tho this may seem natural enough in view of his origin, yet, nevertheless, humble birth does not always keep men in sympathy with the masses of humanity when they themselves have attained high station.

Another thing which is full of good augury was the relations between the Cardinal Patriarch and the Municipal Government of Venice. They were so friendly that the religious processions were allowed in the streets. Cardinal Sarto, in dealing with the authorities, always showed tact and diplomacy, and the power of winning and retaining friendship.

By some it is supposed that the Cardinal's attitude toward the Municipal Government of Venice and his acquaintance with the King and Queen of Italy afford evidence that the old quarrel of Vatican and Quirinal will be buried. But that is pure assumption. The ban of the Church does not forbid people from participating in municipal elections, but only affects the national elections of Italy. No one knows what the policy of the new Pope will be, and much that the papers have so volubly gossiped has been nonsense.

Cardinal Gibbons has been one of the victims of an admiring but not always discreet press, for we find him represented as banding certain Cardinals together and campaigning with them so successfully against certain others that the election of the Cardinal Patriarch of Venice was virtually a victory for him and therefore for "Americanism in the Church" (whatever that may mean). We may be certain that Cardinal Gibbons is not responsible for any such utterances. He had no influence on the result except thro his vote.

Catholics generally have been touched and gratified by the sympathy coming from outside the Church on the occasion of the illness and death of the late Pope; and the widespread interest that non-Catholics evince in his successor must be regarded as a hopeful sign of the times, yet there are some manifestations and some expectations that can hardly

fail to provoke a smile among churchmen.

Many of those who talk about "Americanism" in the Church seem to think that America has certain burning questions to press for settlement—something in the nature of revolution—like the readjustment of the College of Cardinals, so that Cardinals may be apportioned according to Catholic population. There is no sign in the American Church of any movement having such an object, and there is no sign of a movement for securing to this country a greater representation in the College of Cardinals than it now has.

We have only one Cardinal, and it would be a great honor to have others here; nevertheless, we are content to wait. The great majority of the Cardinals must reside in Rome. Their duties compel that, and American Cardinals, therefore, would not be of much assistance to the Holy Father in Church government.

Some of those whom recent events

have stirred up to discuss our Church affairs are filled with the idea that American Catholics are suffering and humiliated because this country is still on a mission basis and in charge of the Propaganda. They imagine that the Church here will now put forth a great effort to have its status changed.

Such an idea is not well founded. There are, to us, certain advantages in being on a missionary basis, such as the greater freedom of our bishops.

In fact, the Church in America has no burning questions and no grievances for the Vatican to settle.

It seems clear that to the late Pope—who was admired and beloved by all the world—has succeeded one of democratic antecedents and sympathies; one who knows men and likes them, and who can lead and mould them; one who has tact, wisdom, patience, experience and very high intelligence.

All churchmen here are pleased with the choice of the conclave.

NEW YORK.

Three Kisses

By Olive Montagu Kindersley

A VIOLET kissed my love to-day,
And then turned white;
And some one passing by, called out,
"How strange! Last night
I saw this flower, and it was blue!"
Dear Heart, within the eyes of you
The blue is flashing bright.

A red rose kissed my love to-day,
Then fell apart;
And Cupid, coming afterward,
Found there his dart.
And on your cheeks I saw confessed
The crimson drops the rose had pressed
From out its bleeding heart.

I kissed my love myself, to-day,
And found a tear.
I would not kiss her lips in case
Thieves should appear.
But where the wind some time had played,
I raised the curls, and undismayed
I hid the kiss, my dear.

LONDON, ENGLAND,

Pius X, the Vatican and the Quirinal

By * * *

THESE is this essential difference between a conclave of the Roman Catholic Church and a national convention for the nomination of an American Presidential candidate, that the action of a conclave is final. The Cardinal who receives two-thirds of the votes, if willing to accept the dignity, becomes Pope instantaneously, while a candidate for the Presidency has still a long road to travel and may never reach the end of his journey. But in one particular the analogy between the two bodies is rather striking. The brilliant statesman who enters an American convention, apparently supported by an overwhelming majority of his party, is very often foiled in the end, and the prize which a Webster or a Clay failed to grasp falls to the share of some "dark horse" whose name is hardly known beyond the limits of his State. So, too, in the case of a Roman conclave, the ecclesiastic whom the opinion of the Catholic world elects to the papal throne is rarely successful in climbing it; as the Italian proverb has it: "He goes into the conclave a Pope and comes out a Cardinal."

In the late conclave there were three Cardinals, representing different currents of Church policy, one of whom, it was generally believed, stood a pretty good chance of being Leo XIII's successor. All who thought that the best interests of the Church would be safe in the hands of a great statesman Pope, a "political Pope," who combined a strong sympathy for France, in spite of her aberrations, with an implacable hostility toward official Italy, saw their ideal in Cardinal Mariano Rampolla. To those who felt that a sterner attitude with respect to France and a good understanding with the Triple Alliance should form the true policy of a "political Pope" in the actual crisis, Cardinal Serafino Vanutelli seemed the coming vicar. There is a very large section of the Catholic Church, however, which considers that a Pope should be pious, humble, charita-

ble, altogether unworldly, holding himself aloof from diplomacy and political intrigue of every sort, well versed in theology and in the Scriptures, for he must defend the dogmas of the Church, but aiming at the conversion and redemption of mankind by apostolic methods solely. Those who held that the great need of the Church was a Pope of this "pious and charitable" type saw the realization of their hopes in the elevation of Cardinal Girolamo Maria Gotti to the pontificate. From all that can be yet learned of the inner secrets of the conclave the early ballots indicated that these expectations might possibly turn out justifiable. At the first scrutiny Rampolla had 24 votes and Gotti 17. As to the votes given to Vanutelli reports vary; but the fourth ballot added only six votes to Rampolla's 24. Then it became evident that a majority of the conclave, or, at least, a minority large enough to control the election, were in favor of a purely religious and non-political Pope, and Cardinal Satolli, former delegate to the United States, suggested Cardinal Sarto as a compromise candidate. He received 27 votes on the first ballot, taken on Monday morning, 37 on the ballot taken in the evening of the same day, and on Tuesday, August 4, he was elected unanimously.

Giuseppe Sarto (now Pope Pius X) was born in the little village of Riese, in the province of Treviso, on the 2nd of June, 1835. Although he is now sixty-eight—the exact number of years of his predecessor on ascending the papal throne—he is said to have all the vigor and activity of a man of fifty. He comes of a family of poor peasants, but a family noted for the industry and sturdy independence of its members. His brother, a small storekeeper and postmaster of his village at a salary of eighty dollars a year, when urged to avail himself of the influence of so near and powerful a relation, is reported to have answered proudly: "I want nothing except

POPE PIUS X

Alley in Vatican Gardens, with Coffee House at End, Where Afternoon Coffee is Served in Summer

to be what I can make myself." One of the new Pope's sisters is a dressmaker, another is married to a peddler, and another to the proprietor of a small wine-shop. The three unmarried sisters have kept house for him in Venice, but the mother could not be persuaded to live in the episcopal palace. She was so much

Fountain of the Sacrament in the Vatican Gardens

State Carriage, Vatican

awed by the sight of his very modest establishment that she hurried back at once to her little cottage.

Giuseppe owed his early education to Dom Bosco, the founder of the Salesian order. His precocious intellect and his serious turn of mind—his teachers used to say of him that he could never have been a child—won him admission to the college of Castelfranco. Then, after a career of high distinction in the ecclesiastical seminary at Padua, he was ordained a priest at the age of twenty-three. He rose, contrary to what seems to be a general impression, slowly but steadily through the different grades of his profession, until, in 1884, he was nominated to the important see of Mantua, where the energy and ability of his administration, as well as the self-denial and austerity of his life, marked him out for still higher promotion.

He was appointed Cardinal in June, 1893, and was sent, soon after, as patriarch, to Venice. It is a mistake—a mistake repeated in all the journals—to say that Cardinal Sarto was the choice of Pope Leo for the Venetian patriarchate. The candidate at first selected by the Vatican for the post was the General of one of the religious orders. As he was

not an Italian, however, the Italian Government declared that no *exequatur* should be granted to him under any condition. Another name was substituted by the Pope, but the new nominee met with no favor, either from the people or from the Government. Then recourse was had to Sarto, who had given proof of great tact, politic temper and *savoir faire* generally at Mantua, especially in his intercourse with members of the royal family, who possessed an estate close to the city.

There was no opposition at the outset on the part of the Government. But an important question arose as to the right of patronage. The King claimed that, as heir to the Republic of Venice, he was privileged to nominate a candidate to the Holy See. The Pope insisted that this right had lapsed when Venice lost its independence. Commissions were sent to Vienna to investigate the archives, but the question was never solved. It was a pretty quarrel, altho the matter had no real importance, as the royal patronage had by this time been reduced to a mere fiction over nearly all Italy. Cardinal Sarto got his *exequatur*, and the storm that set the quiet waters around the Lido raging for a while is now chiefly remarkable because it brought him for the first time into prominent notice at Rome. He showed immense ability and energy in safeguarding the rights of the Holy See and repelling the assaults of the Italian Ministry. He proved also that he could be as independent of the Vatican as of the Quirinal with respect to questions which had to be decided by his own conscience as the ultimate tribunal. When it was known that King Humbert was about to visit Venice, Pope Leo inti-

mated to him forcibly that he should absent himself from his episcopal city on the occasion. The Venetian Patriarch, though comprehending fully the delicacy of the situation, determined not to obey. He took the first opportunity to pay a formal visit to the Italian monarch, and explained his position frankly and the instructions he had received. Some portions of the dialog between prince and prelate leaked out and were much discussed. The Vatican was discontented, and Sarto went to Rome to justify himself. His vindication of his loyalty as a churchman must have been eminently satisfactory to Leo, for it is believed that after that interview the late Pope first entertained the conviction that Cardinal Sarto would be his successor. The present King of Italy seems to have inherited his father's esteem and affection for the Patriarch of Venice. On his visits to the city he has issued orders that, no matter to whom he was giving audience, Cardinal Sarto should be at once ushered into his presence on his arrival. But the Cardinal, with equal good sense and good taste, has always

disregarded the entreaties of the court ushers, and remained in the anteroom until the King's visitor had taken his leave; a mere affair of deportment, but perhaps supplying the key to a character whose elemental basis is simplicity and veracity. His dislike to display of every sort was exhibited immediately on his accession. He refused flatly to be carried to the Sistine Chapel in the *sedia gestatoria*, a breach of ancient custom so portentous that to some venerable chamberlains of the Vatican it must have foreshadowed the downfall of the Papacy or the coming of the Last Judgment. He took his first walk in the Vatican Gardens entirely alone and unattended, creating, it is reported, a feeling almost of consternation in the gardeners and workmen, accustomed to see the Pontiff accompanied by a long file of attendants, Swiss Guards and Noble Guards, a *cortège*, one must fancy, better adapted to the state than to the comfort of the central figure. Evidently a democratic Pope, not only in sentiment, but in every turn and twist of his mind, and, above all, in his habits. From some an-

The Vatican Gardens, with St. Peter's in the Distance

ecdotes recorded of him he would seem, like his namesake, to possess the saving grace of humor, a priceless gift to every one, but especially so to one who will of necessity have to meet a great many wearisome people.

We have said little of his administration in Venice, but all acquainted with it appear to agree in regarding it as faultless. "He has made Venice the rose-garden of the Church," says one Cardinal. He found the city a seething hotbed of anarchy and anti-clericalism; before his patriarchate had lasted a year the bridges and quays would be covered with cheering crowds whenever he appeared in his gondola. The liberals were

ple; but the destruction by his orders of several dubious relics did not shake his popularity in the least.

With all his amenity of manner and perfect goodness of heart, it has already become evident that Pius X will be as intractable on questions of principle as either of his two predecessors. The refusal to give the blessing *urbi et orbi* from the Loggia of Raphael, the refusal to notify the Quirinal of his accession, and the consequent refusal of the Italian Government to allow its officials to take any part in celebrating the Pontiff's accession, all foreshadow the attitude of the Vatican, at least for some time to come. Quirinal and Vatican will still

The Cardinals who were the leading candidates for the Pontificate on the first ballots.

as enthusiastic in his favor as the blackest of the blacks, proving perhaps that whatever irreligion there is in Italy is but skin-deep, and due to the faults of many of the upper clergy in the past rather than to the people. It would take pages to enumerate all the changes he introduced into the organizations for the care of the poor and for the education of the people. The modern and progressive spirit he infused into the numerous institutions of his own creation was at first rather startling to the worshipers of routine; even they had in the end, however, to acknowledge its beneficial results. A more daring adventure of Cardinal Sarto was his interference with some of the pet superstitions of his peo-

ple; but the destruction by his orders of several dubious relics did not shake his popularity in the least. Both have got into an *impasse* from which there seems to be no issue for either. A change of personality on the throne of Italy or on the chair of Peter may result in an armistice, a temporary accommodation, but will not produce a reconciliation. The successors of Humbert and of Leo, in spite of all their goodwill and personal affection, cannot forget the quarrels of their predecessors, cannot even find the terms of a compromise acceptable to both the hostile forces. Between Church and State there would seem to be only one possible *modus vivendi*: respect for religious liberty on the part of the State, and a tacit

acceptance of facts, which Providence, for some dark and inscrutable purpose, has allowed to be accomplished, on the part of the Church. The Pontificate of Leo certainly demonstrated how very easily the Vatican can accommodate itself to accomplish facts and derive the utmost possible advantage from them, while at the same time resisting them violently and protesting with horror at their unspeakable iniquity.

The new Pontiff, then, will protest against the loss of the temporal Papacy. Such protests have now become traditional, and may continue down through the century. But the Vatican's relations with Italy will continue to be endurable. There will be no open rupture, and there will be no ostensible reconciliation. The essential point of the situation is that there will be a sort of acceptance, a recognition, of mutual independence. Pius X will have fewer entanglements to fetter his action than had Leo XIII. He can lend himself more easily to a *combinazione*, one of those very practical combinations always so dear to the subtle heart of the Italian diplomat, and which can create

order, or something that looks like order which does quite as well, out of the most chaotic of political chaos.

Yet it cannot but be unfortunate that this interminable duel should go on forever between Pontiff and King. As long as Rome continues to be the centralized brain of a world-wide moral power, there must exist between it and the Papacy the very closest community of interests, materially as well as morally, for the amount of money drawn yearly from the coffers of pilgrims and travelers to the Vatican is incalculable. It is particularly unfortunate for the House of Savoy, exposed to attacks from many different quarters and especially from the rising tide of socialism. It may well fear to be replaced in a not very distant future, legally or brutally, as the case may be, by some more radical form of government. The stability of the French Republic for a period of over thirty-two years points, if it continue to grow firmer and firmer, toward the creation, or attempts at the creation, of a republic in other European countries.

WASHINGTON, D. C.

The Signature and Coat-of-Arms of Pope Pius X as a Cardinal

Flower and Soul

By Clinton Scollard

THUS saith the flower:
 "I wait the perfect hour;
 Then will I wake,
 And into blossom break,
 Bright-wooded and won
 By my deliverer, sun!"

My soul saith: "Like the flower.
 I wait the perfect hour;
 Then out of gloom
 Into ecstatic bloom
 I shall be straightway won
 By Faith's bright sun!"

CLINTON, N. Y.

Industrial Arbitration in New Zealand

By Edward Tregear

[A short while ago a surprising number of papers throughout the country announced the forthcoming failure of compulsory arbitration in New Zealand, owing to the growing dissatisfaction with it both by the employers and employed. These gloomy reports, which appeared to emanate from New Zealand itself, were published even more widely in England than here. Although we said at the time that we believed the charges were false, we wrote to Mr. Tregear, who as New Zealand Commissioner of Labor ought to know more about the situation than any one else, to tell just what the feeling was in New Zealand in regard to compulsory arbitration. We are glad that our previously expressed belief turns out to be true.—EDITOR.]

IT appears at first difficult to ascertain the true position of industrial affairs in New Zealand on account of the widely differing statements sent forth by writers within the colony. This difficulty, of course, only occurs to those people abroad who endeavor to gauge the situation by comparing such contradictory reports; within the colony itself there is no possibility of doubting on the subject so far as the public opinion goes. On one side there is an enormous majority of the people in favor of the legislation which has had, in their eyes, such potency for good; on the other side a minority exists, in the main part composed of those whose abodes in districts far removed from centers of economic activity and whose pursuit of agricultural or pastoral avocations render them careless of the influences which affect industrial movements. To the minority, however, belongs also a smaller body of active opponents of all labor legislation, the extreme individualists who insist upon the right of every man "to run his business as he likes," and this division of the population has some very indefatigable and not very scrupulous penmen in its service. To their efforts it is owing that the difficulty arises in the minds of investigators at a distance as to the true position, and it is due entirely to the unpatriotic and misleading attitude assumed by such writers that an article like the present has to be issued.

Before descending to detail, it may be as well to briefly review the general position of the colony in industrial matters. Ten years ago it was loudly asserted that "Capital will be driven away" and general commercial ruin follow if effect should be given to the proposed labor legislation. Since that time measures

exceeding the wildest flights then projected have been passed through Parliament and found their way to the statute book. Yet the career of the colony has been one of advancing and exceeding prosperity. The act considered as by far the most experimental and dangerous of the whole brood, the Industrial Conciliation and Arbitration Act, has infinitely justified the hopes of its promoters. Under its ægis we have seen the number of factory workers expand from 29,000 in 1895 to 59,000 in 1903. In five years the annual wages paid in factories increased from \$9,537,960 to \$15,472,805. Our exports last year rose 25 per cent. on those of the previous year, advancing from \$60,790,130 to \$75,873,695 in the twelve months. So the detractors of labor legislation shift their ground. We are to be terrified no more by the cry, "Capital will be driven away." That poor bogey of escaping capital has been exposed to the light of day in too effective a manner. Now the bode is changed to "The good times have come in spite of you; and your legislation (especially the Arbitration Act), which is successful in fine weather, will never survive the day of industrial storm."

It is only fair argument to adduce reasons for considering that the good times did not evolve from "a fortuitous concourse of atoms," but resulted from a wise and far-seeing policy. The Land for Settlement Act broke up the large estates and partitioned them among producers. The Advances to Settlers Act gave the struggling farmer cheap money borrowed abroad by the Government, allowed him to free his neck from smothering mortgages at high rates of interest, and brought prosperity to thousands of

homes. Markets were sought for; wool, flax, butter, frozen mutton and other products were graded or in some way assisted; lines of steamers were subsidized, and all this by the Ministry on behalf of the people, output being stimulated and commerce encouraged by every thinkable device. If the colony has responded to the efforts of its leaders, and if the large increase in exports, in manufactures and in revenue has become undeniable even by our bitterest opponents, can it be truly said that this has arrived by chance and in spite of "advanced legislation"?

As to the bulk of the statutes grouped under the name of Labor Laws, most of them have reached an impregnable position. The acts dealing with Factories, Shops and Offices, Truck, Workmen's Compensation for Accident, Old Age Pensions, Mining, Shipping and Seamen, Domestic Servants Registry, Shearers' Accommodation, etc., have been accepted in their principle universally among us. It is only an outlying section or two of such measures which at times invite a stray shot from the shapshooters of the enemy. The Industrial Conciliation and Arbitration Act, however, is still considered as the key-position of the industrial conflict, and against its front is poured all the ammunition the opponents of liberal legislation have to spare. But this ammunition has to be used at very long range; indeed, most of it is fired at us from magazines and newspapers in England and the United States; with the curious result that it does much damage in the place where the gun is discharged, while the missile is harmless when it reaches the colony at which it is aimed.

The Arbitration Act has now been in force about nine years. During the two or three years succeeding its initiation little use was made of it, except that the workers slowly formed themselves into industrial unions, while the employers stood aside in haughty immobility. The position has long since changed. It was soon found by employers that the advantage given to labor by organization under the act was too great to be met by individual effort or collective disdain. The forces of labor now encounter opposition from associations of employers

as thoroughly disciplined and as well officered as their own. There are at present registered in New Zealand 97 Industrial Unions of Employers and 274 Industrial Unions of Workers. No trade of any consequence exists in the colony which is not working either under an Industrial Agreement or under an Award of the Arbitration Court. The general effect of the act has been to promote stability of business and confidence in undertaking contracts, to raise wages, to shorten working hours and prevent unnecessary overtime, to eliminate the "sweater," and encourage legitimate, honest competition in trade. That such effects have been wrought is no doubt a subject of congratulation to those who regard the welfare of the greatest number as the most desirable of advantages, but it can be easily understood that such results have not been reached except through a storm of calumny and misrepresentation from those whose determination to have their own way with their men and with their competitors, without regard for others, makes them impatient of control or direction.

The duties of the Arbitration Court are not confined to making awards in cases of industrial disputes. Much of the time of the court is occupied hearing applications alleging breaches of award, and a lesser portion of time is spent in deciding cases under "The Workers' Compensation for Accident Act." Three volumes containing the texts of recommendations of Conciliation Boards, Awards, Decisions, etc., of the Arbitration Court have been published by the Department of Labor, and form the work of reference necessary to the investigator engaged in the study of the operations of the act. That the act has again and again had to be amended in detail is the subject of frequent taunts from its opponents; but it will be admitted by impartial critics that in the nature of things such amendment must be necessary in regard to a measure finding no precedent in legislation, and having to meet new points of difficulty as they appear in the rise and fall of industrial and economic tides.

The main object of the act was, as is well known, to prevent the loss and disaster to the whole community formerly

caused by strikes and lock-outs; so far this has been successfully achieved. In spite of the studied and systematic efforts to misrepresent abroad the results of the act, there has been no attempt at a strike or lock-out in New Zealand during the last nine years that has not instantly been suppressed by the operations of the act. If I have quoted figures showing the direct advance in wages and in business generally, who shall count the enormous indirect gain to the whole community through the cessation of the strike, and of the trade paralysis which is an inevitable effect of active industrial warfare? Who shall reckon the moral advantages accruing from the abolition of constant recrimination and dispute between employer and worker as to wages, hours, holidays, etc., the loss of temper, the irritation caused by instability of income, the antagonistic class feeling developed by incessant demand and rejection? These mental gains may be regarded by the superficial as mere incidentals, as sentimental fancies foreign to the conduct of real business, because their value cannot be appraised in terms of dollars and cents; but to the thinker they will appear as actual, if intangible, advantages tending to that tranquil peace of mind which not only makes for effectiveness and prosperity, but is in itself the most valuable asset that success can bring to the victor. "The rest is all but leather and prunello."

Much has been made of a so-called lock-out in the Auckland furniture trade in March last. Doubtless the readers of THE INDEPENDENT have heard it alluded to and explained until weary of reference to this minnow posing as a whale. Suffice it to say that when the dispute was referred to the Arbitration Court it was decided after a long and patient examination that there had been no lock-out, that the employers had been within their rights and had not broken the court's award in discharging a small minority of their men who could not

earn the new minimum wage decreed by the court. The right of an individual master to discharge an individual workman if unsuitable, or the right of a workman to change his employer, were two issues not brought into question. The sole point on which the decision of the court was asked was whether the employers had acted in combination in discharge of their men, and, if they had, to declare the action a breach of award. The court held that according to the evidence adduced there had been no agreement or combination to discharge men, and therefore the case was dismissed. The men found other employers (of course at the increased minimum wage rate); the dispute, such as it was, faded away before the search-light of judicial investigation, and a trouble which might perhaps, under the old system, through sympathy, have entangled in its evil meshes every trade union and every branch of business in the colony, came to a peaceful end. The dispute disclosed anew the beneficent workings of the so-called "compulsory arbitration," and those who prematurely rejoiced over the failure of advanced legislation have had to confess that rifles, boycotts, injunctions, armed pickets and the starvation of families could scarcely have produced a more satisfactory termination.

This, then, is the state of affairs in the colony. For an outlay of some \$10,000 a year—less than the cost of one day's loss and destruction to the community over a single strike—we have industrial peace and commercial security. Here trade disputes assume no more importance in the public mind than do the ordinary civil law cases reported in the morning newspaper. The people of the colony generally can afford to smile when they see reflected from foreign lands the distorted image of their industrial position as it appears in the valuable letters of "Our Own Correspondent" to the conservative press.

WELLINGTON, NEW ZEALAND.

The Face in the Creek

A STORY OF A KENTUCKY FEUD

By Eva Elizabeth Luke

THE old man was "cooning" for fish.

With his cotton shirt open at the neck, the sleeves turned back above the elbows, revealing arms sun-burned and sinewy, and an old straw "Jimmy," its brim torn and hanging, crowning his grizzled head, he stood knee deep in the waters of Panther Creek, and with a long sharp-pointed stick probed into the crevices of the great rocks, catching with his naked hand the shining fish as they darted out. Further up the stream a tow-headed boy was similarly engaged.

The spot was romantically beautiful. The creek, deep and dark, flowed slowly and noiselessly between banks which, rising abruptly from the water's edge, reached a height of sixty, seventy and in some places one hundred feet; great shelving precipices of rock and slate, in the crevices of which ferns, wild flowers of delicate hue, tangled vines and small trees found lodgment. It was early morning, but scarcely a ray of sunlight penetrated the deep ravine, and not a ripple flicked the surface of the placid stream, so placid that it reflected the outlines of the graceful ferns and the arch of blue sky far overhead.

There was no sound save the calls of the birds, the drones of insects and the splash of a kingfisher, who industriously plied his vocation from the limb of an overhanging dogwood, which every now and then showered down a mass of snowy petals. Some little distance below where the old man stood a brook emptied itself into the creek. Its way had, hundreds of years ago, been cut through the solid rock, which now rose high on either side, its surface white with the blossoms of a clambering vine.

Along the bed of this stream a snipe was lazily wading, diving its long bill down in search of his morning meal, the only sign of life in sight until a man peered cautiously around a bend a little way up the brook and then crept stealthily down its pebbly bottom, an old, un-

kempt man, who carried a gun on his shoulder. The bird, frightened at the approach of a stranger, uttered a warning cry and rose in the air. The old man in the creek noted the bird's cry, but being intent on the catch of an unusually big bass, waited a moment before looking around, and when he did so no one was in sight. The man with the gun had crept as noiselessly as a cat onto a ledge of rock and then into the branches of a tree which overhung the water.

The "cooning" went on again, the old man moving down the stream, only stopping occasionally to squirt a few streams of tobacco shoreward. Long practice had made him an adept, and the streams never fell short of their aim. Then, taking a dirty red handkerchief from the crown of his old hat, he would wipe his stained whiskers, replace the handkerchief, give his hat a pull, and with renewed energy turn to the "cooning" again.

Some time had passed in this way, and he had reached the rocks directly under a big cottonwood, when, bending over, his back toward the shore, the top of his pointed stick just touching the water, he paused. It seemed hours to him, but it was barely a second, that he remained in that position. Then, raising his great body, his eyes thrilling with wild passion, his hand trembling from suppressed emotion, he took a step toward the shore, where his gun lay ready, when his progress was arrested by wild screams from Jonah, the tow-headed fisherman aforesaid.

The boy was leaping up and down in the water, screaming with all his might, his right hand tightly grasping the middle of a huge water moccasin. With an oath, and "Jony, let go that thah thing, or'l lamm th' life aout uv ye," the old man rushed up the creek at his boy, the long stick in his uplifted hand. Jonah, thus admonished, "let go," and flung out his arm with such violence that the snake landed on the other side of the creek.

frightening a flock of birds who were taking their morning bath in the shallow pools on the rocks.

With a grim smile at the ludicrousness of the scene, the old man retraced his steps and, reaching the brook's mouth, carefully eyed the bank, where, however, no living soul was visible.

Jonah, who had had no notion of repeating history, had crept whimpering out of the water, and sat upon the rocks.

The old man turned to him and drawled out:

"Wall, Jony, I reckons that thah baskit is full 'nuff to do yoh ma foh a day, ennyhow. 'Spose now that ye tote it home and rest up yoh narves a spell. Nex' time I'll take Lige 'r Punch, 'r sum un that won't go into re-al fits oveh a liddle mocysin. Go on, sonny, I'm goin' squirrel huntin'."

Jonah looked reluctant. Squirrel hunting in the cool woods was more to his taste than "coonin'" with such startling results, but he obeyed without a word, only glancing back once in a while with a wistful look.

The old man did not move until the boy was out of sight; then he shouldered his gun and began to climb the steep ascent of the bank, holding on to roots and trees. All morning and until late in the afternoon he roamed through the woods and over the cliffs, looking into every nook and sheltered spot with which sixty-five years' experience had made him familiar, but found no trace of any human being. At last, when the sun was getting low, he brought down two squirrels, and, slinging them over his shoulder, started for home. On his face was a look of unrest, of unsatisfied desire; within his being there burned the fire of twenty-five years of unquenched hatred.

He had seen the face of his life-long enemy in the waters of the creek, and was not able to determine whether it was man or spirit.

It was quite sundown when the old man reached his home. The house was perched high on the creek cliffs, and, looking toward it from the valley, it seemed almost in the clouds. It had originally been a double log cabin, but was now weather boarded and had one room built on top, reached by a ladder

from the outside. The doors were open and there was a smell of frying fish. Two or three big dogs slunk out of the passageway between the rooms and ran yelping to meet their master. The dogs brought out a half-dozen children, all bare-footed and tow-headed, and a tall, big-boned woman appeared at one of the doors, meat fork in hand.

After the evening meal was over the old man filled his pipe and sat down on the door-step for his nightly smoke. The events of the day brought up a train of recollections, and as the blue smoke curled in waves around his head many faces and scenes of other days rose before him.

He saw himself and another—boys just home from the Confederate army—boys who had sworn fidelity to each other, and had fished and hunted and even courted together. Never should he forget the day they had quarreled. He could not help a feeling of sorrow even yet, but it was mean of Sam to kill his favorite coon dog; he wished he had that coon dog this very minute. He had been the best coon dog he had ever seen, and for Sam, of all people, to kill him! Why didn't he tell him he was catching his chickens? Then he remembered the quarrels that had followed, culminating in a terrible feud, in which his brothers were involved and all the families of each, no less than himself and Sam. And then, blotting everything else from memory, came that other day, when, with his young wife and his brother, he had gone to the county fair and met again his old chum—now enemy. He never could tell how it happened—he had meant that it should not—but somehow the feud broke out again, and almost before he knew it his youngest brother lay dead at his feet. Despite his years he could yet feel the crazed impulse with which he sprang toward the murderer, his wife clinging to him, piteously begging him not to shoot, when from somewhere—he knew not where, for many men were shooting—came a shot which—Oh, God, how hard it was, tho so many years had passed—which struck her. A mist rose before his eyes as her face seemed to rise in the curling smoke, her face as he had seen it in the weeks of agony and pain that followed, and on that

last day, when the yellow clay had closed over it forever. He took the pipe from his mouth and laid it on his knee. Vengeance he had sworn to have over that mound of earth—vengeance, tho it took all his life to accomplish it. But his enemy seemed to have slipped completely out of existence. Long years had passed in the search and he had grown old and gray without finding the slightest trace of his whereabouts. And now the face in the creek to-day. Had his enemy been within his reach, or was this a spirit from the unknown world?

It was growing dusk. The murmur of the creek sounded far below. The frogs began their evening calls, and an owl hooted in a tree near by. Down by the fence he could hear the voice of Jonah relating for the hundredth time the story of the morning. The old man was thinking of turning in for the night and letting the morrow solve his problem, when his wife came round the corner of the house and stood before him. She was his third wife, and tho not the mother of any of his children, was a simple, good-hearted soul, who treated them kindly, kept his house, cooked his meals, and planted and hoed the garden, while he fished and hunted and made long trips after his enemy. He knew now that she wanted something, but waited for her to speak. She stood silent a moment pulling at her apron, then, seeing that he waited, said quietly:

"Abneh, Rosy wants to go to the moonlight to-night. It's th' fust uv th' season, ye know. It's at Ras Bean's."

The old man blew out two long puffs of smoke, then deliberately took his pipe out of his mouth and, raising his right hand, said slowly:

"Lizy Ann, ye go back an' tell Rosy not t' dare go to enny moonlight this side uv that room up thah. Do ye hear? Call th' brats an' put 'em to bed."

His wife went away without a word and soon all was quiet in the house. The old man, however, did not move. He had a notion that Rosy had not obeyed him. She had given in too easily. There was generally a scene, and generally he it was that gave in, for Rosy was the child of his beloved. His heart softened a little as he thought of her beauty, and how she would be missed at

the "moonlight," for she was the belle of the section. Then it occurred to him that he had been too hasty; it was not right to spoil her pleasure if Sam had come back and he was worried. He would go and tell Rosy she could go; that he would saddle the brown mare and take her himself.

He got up and mounted the stairs to his girls' room. Two heads were in one bed, but in the other one pillow was vacant. Rosy was not there, and the general confusion of ribbons and clothing showed that she had dressed carefully. Rosy had gone to the "moonlight" without his consent. It was a daring thing to do, but he could not feel angry toward her. Indeed, there was a sort of secret pride in his heart. She had so much spirit. He thought a moment. He would go, too. He would frighten Rosy and teach her a little lesson. Then he would bring her home (he wondered how she had gone) and protect her if any of the young chaps proved too attentive, as they often did. He went down the steps, got on his horse, and had just reached the valley when the moon peeped over the horizon.

The "moonlight" was in full blast when he arrived. From a space of about fifty feet square in the big meadow in front of the house the sod had been cut and the place filled in with tanbark. Rows of Chinese lanterns strung on wires lighted the place, and all around were rude benches for those who wished to rest between dances, or were simply lookers on. At one side was a lemonade stand, where a rushing business was being done. It was gaily decorated with flags and bunting, and here pink lemonade, pop, ginger ale, good old Bourbon, peanuts, popcorn balls, peppermints, candy kisses, sticks of horehound, liquorice and monkey boxes were for sale.

At the other side of the tanbark square, in a high farm wagon, was the band, which ground out a succession of wild, jerky strains. A country boy scraped on the fiddle, and another twanged the guitar; a man from the city played on the bass viol, and a German, who had no control of his eyeballs, and who, when trying to look due north, was apt to look due south, sounded the flute. A man who had long ago become a professional

in his art was calling the dances in a voice that could be heard over the hills.

"Slute yoh ladies! Corners! Partnehs! Side couples fohwad! End couples fohwad! Change an' dance! Do, C, Do, Ev'ybody dance! Bird in a cage an' all han's roun'! Balance all, bow to yoh patnehs! 1, 2, 3, 4, 5, 6, 7 in a buggy, an' all han's roun'! Now git yoh lettie gal, and A L L off to the Worl's Faih! B L A C K S N A K E! Eight purty gals to the centeh, and gents all 'roun'. Now ev'ybody dance! Kiss her, Bud, she won't care."

Kicking and hopping and jumping, the young folks followed his calls, and the air was so thick with the tanbark that one could scarcely see, and breathing was difficult.

The dancers were a goodly company. The girls, without an exception, were in lawns and white, much beruffled and bedecked with colored ribbons. The boys, big awkward fellows, had a special plaster of grease on their hair, wore tight "pants" and gorgeous neckties. A city young man from one of the camping parties in the neighborhood danced in the throng, wearing white duck trousers, greatly to the amusement of the country youths, who nudged each other, made foolish remarks and looked "daggers" whenever he succeeded in securing some fair country maid for a dance.

On the outside a large crowd had gathered to watch the dancers and shout remarks. One young man sat dejectedly on a bench. He had brought his best girl to the "moonlight" and had not been able to have a single dance with her. The boys, knowing "how stuck" he was, had so contrived that he was left without an opportunity to ask her. Near him was a girl, whose black eyes gave out fiery sparks as she watched her rival dancing with "her young man." Finally, unable to endure the agony any longer, she jumped up, forcibly detached the girl, and danced away with the frightened youth, a gleam of triumph in her eyes. "Now she's got 'im! Hol' 'im tight, Katy," yelled a bystander.

On the outskirts of the throng the old man stationed himself, looking for Rosy. It was not hard to find her. There she was, her black eyes sparkling, a red spot glowing on either cheek, dancing with—

could he believe his eyes?—he took a step nearer—yeh, dancing with the *son of his old enemy!* For a moment a sort of something between anger and amazement filled his soul. He moved through the crowd until he stood on the inner edge of the circle about the dancers. Rosy was coming toward him! He waited for her, and as he waited he saw a man step out of the crowd on the other side and raise a gun. He saw the aim! He was powerless to move! *The face in the creek had not been a ghost!* Rosy came nearer! She reached him! The man pulled the trigger! Rosy's partner sprang between them, and two shots rang out!

In a second fifty revolvers flashed and fifty women screamed. A stampede took place and wild confusion reigned, but above all the tumult could be heard the voice of the German, he of the rolling eyeballs: "Ach, mein Gott in Himmell, I am kilt, I am kilt! Dese blarsted Kaintuckians! What for do I come to dese accursed blace?"

The young men, "with unusual bravery," made for the wood pasture on the left, and the girls, "to a woman," ran for the gate leading into the Beans' yard. Finding the press too great here, and fearing instant death if they waited, they raced down the lane and, raising their skirts, vaulted over a high rail fence into a field beyond.

When the tanbark cleared away not one of all the crowd was in sight. Ras Bean stood sorrowfully surveying the wreck and muttering curses against the men who had spoiled his chance for a "big haul" on the "moonlight." Chairs, benches and tables were overturned and broken, and the lemonade stand was a mass of kindling wood. His wares were scattered, and a stream of fluid from an overturned tub dyed the ground and would have made a stranger believe that forty people had lost their lifeblood. On a bench the German, still shrieking, was stretched out. The first shot had grazed the tip of his ear, and the sight of the blood had caused him to believe that he was mortally wounded, and no amount of persuasion could convince him otherwise; but with his eyeballs rolling in every direction so rapidly that it made one dizzy to look at him, he kept on

shrieking out in broken English about "dese accursed Kaintucky."

After a time the youths, one by one, came out of the woods and from behind trees, and, finding their respective girls, got into their buggies and rode away in silence.

No one saw the man who had done the shooting, and only one person had seen "three men an' a gal go flyin' down the pike s'f th' devil wuz afteh 'em."

In a little wood a short way down the roads from the Beans', in a cleared space where the moon shone down on them, were the four principals in the little drama just enacted. The old man leaned with his back against a tree. His enemy stood in front of him, his arms resting on his long gun. Rosy's partner, young Tom, lay on the ground between them, where he had fallen exhausted from his run, and kneeling at his side, her white dress stained with his blood, was Rosy, gently bathing his wound and speaking endearing words.

The old men faced each other quietly. After a while Abner spoke.

"Wall," he said, "ye tried it agin an' failed."

The other spoke.

"Abneh," he said, "ye've hunted me nigh onto twen'y yeahs, an' now I reckons ye've got me. I've bin most ev'ywhah sence I lef' hum. Down in the mountings in Ten'nysee an' Karliny foh yeahs an' ofentimes right undeh yoh fingehts, but ye nevah cotched me. Then I got tired an' went aout west, an' lived with th' cowboys and' then with the Injuns. They treated me like quality, an' I liked th' life well nuff, but I wanted to see my boy, heah, an' longed so foh hum. Then I heard 'bout the Govnah trubble, an' I lowed to come hum, see my boy, an' fit on one side or t'other, 'cause I heard there wuz goin to be sharp fitin, an' git kilt, an' rest in ol' Kaintucky groun'. I luv ol' Kaintuck, an' I couldn't bar th' thought uv dyin' way aout thah 'mongst them big mountings. An' so I cum back, but when I got heah, I foun' th' chance uv fitin' bout the Govnah trubble all gone long ago. An' Abneh, this mornin' I wuz up on the' big cottonwood, oveh whah ye wuz a fishin', an' had ye at my mercy foh an hour, mebbe. I went thah, Abneh, to see ye, cause I remembhed

how we usen to 'coon' in that very spot. When ye saw my shadder, I thought I wuz a gonner, but while ye ran afteh yoh kid, I cleared aout. An' then befoh the' moonlight, I saw my boy an' he begged me with teahs in his eyes to go away oveh to Injianny, said he'd sen' me money to take cah uv me the rest uv my life, which would have bin short, cause he an' yoh gal wuz sweet on each otheh, an' he know'd he couldn't nevah got yoh consent ef I stayed roun' heah. I promised, but I wanted to see th' moonlight. It brought back ol' days, Abneh, when you and me wuz young and danced with our gals at moonlights. An' when I see yoh gal, she looked so much like anotheh one I couldn't go away. You nevah knew I loved heh, too, did ye, Abneh? An' Abneh, I never fihed that shot that killed heh. Before Heaven, an' as a dyin' man, I swear. Then when I seen you comin' at them, I lowed ye'd kill my boy, and befoh I know'd what I wuz doing' I fihed an' then wondehed why God didn't strike me dead, when I seen my own boy stagger. Now I'm heah, an' I'm ready to die. I'm tired uv travelin'. I've got nowhah to lay my head, an' I've kilt my only boy. I desERVE to die, but fust, Abneh, won't ye shake han's, rememberin' them days when we drunk from the same canteen, an' gnawed on one crust, an' fit the Yanks?"

He stretched out his hand, but the old man said: "Wait, Sam."

The other dropped his arm with a disappointed look.

"Shoot then, Abneh," he said.

But the old man did not raise his gun.

"Sam," he said, "ye murdered my brotheh, ye murdered my wife, even tho ye mayn't hev fihed that shot that kilt heh, an' now ye are yoh own son's murderer. On heh grave I made a solemn vow to heh an' him that I'd meet an' reckon with ye, an' I'll keep that vow. I've trained my eye an' han' foh many a day foh this minute, till I'm known as th' best shot in Kaintuck. I could shoot th' hat off'n yoh head, an' not hut ye, so it 'ell all be oveh quick."

He raised his gun and pulled the trigger. Rosy sprang to her feet and clutched his arm, but it was too late. When the smoke cleared away it disclosed Abner's old enemy standing still.

but with a bullet hole through the crown of his old felt hat. The old man had proved his marksmanship. He laid down his gun and reached out his hand.

"Now Sam," he said, "I'll shake. I've done my duty. I aimed true, but somehow I'm gettin' ol', or mebbe I'm narvous." There was a twinkle in his eye. "My shot went wild. Rosy," as the girl clung to him hysterically, "what do you want?"

Her arms were about his neck, her soft lips against his rough cheek.

"Pa," she said, "Tom's all right. He'll git well, and, pa, say ye'll forgive me, and give us your blessin'. Tom an' me got married to-night, pa."

And the moon riding high told no tales as she saw the old man brush away a tear and, laying his daughter's hand in her husband's, mutter, "God bless ye, Tom, ye saved my life."

JEFFERSONVILLE, IND.

The Kindergarten's Message to the Mother of Culture

By Marion B. B. Langzettel

[Mrs. Langzettel conducts one of the most successful kindergartens in New York City. Not only is her kindergarten equipped with every appliance for putting in practice Froebel's theories, but there are even lecture courses for the mothers of the little children.—EDITOR.]

EVEN to-day we find people who claim that the kindergarten is all very well for the child of the poor, but not at all a necessity for the child of the rich. These people conceive of the kindergarten as a philanthropic rather than an educational institution, and hence fail to grasp its deeper import.

Three great thoughts of the last century are fast helping us to understand more truly the real meaning of Froebel's philosophy. I refer to the ideas of evolution, the lengthening of the period of infancy and the spiritual destiny of man. The theory of evolution, which in Froebel's time had hardly been formulated, has now become the ground work of all intelligent thinking.

Those of you who are familiar with Drummond's "Ascent of Man" will remember with what a graphic touch he traces the steps out of savagery into motherhood. How, the personal tie once formed, tenderness, carefulness, sympathy and love are gradually evolved in the evolution of the family. He says:

"No greater day ever dawned for evolution than this on which the first human child was born, for there entered then into the world the one thing needed to complete the ascent

of man—a tutor for the affections. To create motherhood and all that enshrines itself in that holy word required a human child. The only thing that remains now is to arrange that they shall both be kept in that school as long as it is possible to detain them, and the next effort of evolution is to lengthen out these schooldays and give affection time to grow."

To John Fiske are we indebted for another most beautiful contribution—namely, the meaning of this lengthening of the period of infancy. The child is to surpass all previous efforts and become a spiritual being, hence in this longer period of infancy he is to perfect the machinery which shall place him at the summit of creation. Fiske* says:

"As we rise in the scale of civilization the period of infancy lengthens, step by step, until in the case of the most highly educated man, where adjustments must be made to a wide range of intellectual environment, the age of tutelage extends for almost a quarter of a century. The use of this to morals, the reactions, especially upon the mother, are too obvious to dwell upon."

And with the understanding of this period of early infancy shall come a

* "Spiritual Destiny of Man," by John Fiske.

clearer vision of the possibilities of motherhood.

Our growing interpretation of education is well voiced by Hamilton W. Mabie when he says:

"Education is a process by which man comes into possession of his own nature, and into real and fruitful relations with the world around him."

Froebel says:

"Education consists in leading man as a thinking, intelligent being, growing into self-consciousness, to a pure and unsullied, conscious and free representation of the inner law of divine unity."

Unity, law and self-activity were Froebel's watchwords. Life in its every phase was to him governed by law. In the crystal he found each solution crystallizing true to a certain form. In the plant he found number and color governing every plant belonging to the same class. In animals he saw each true to its own species, and in man he saw a law of unfolding uniting him to all others and to God. Through the constant use of this life within man he is to master and create—master and create living things—master and create himself.

Looking at the new born child in his helplessness and purity, the mother wonders what the future holds in store for her child. Looking backward, she sees within his reach all the struggle of the race crystallized into history, music, art, literature and science. Looking

within, she finds new impulses surging through her heart in response to the needs of childhood, and a new determination to be more, that she may give more. Looking upward she prayed:

"Oh, Father God—life of all life,
Love of all love—
In whom we have our being,
Live and move,
Let this thy life flow undefiled
Within our child,
That we may be
Bound ever closer in thy love
To him and thee."

The kindergarten has come to help the mother by showing her the manner of

Play with the Limbs. From Blow's "Mottoes and Commentaries,"
D. Appleton & Co.

evolving ideals in her child's consciousness, by which his criminal humanity may be transformed into spiritual humanity.

Did you ever stop to think of the number of mothers who play peek-a-boo and pat-a-cake with their babies and the reason thereof? Froebel says that what the natural mother does incidentally, intermittently and disconnectedly, we must learn to do consciously and in a logical sequence. We must recognize the reason implicit in instinct, learn its methods, and, without losing its *naïveté*, develop into a systematic procedure its incidental suggestions. The human spirit is a living unity and should never be content with a fragmentary expression of its wholeness. Hence "the sweet reasonableness" manifested in the simple intercourse between mother and child must not be suffered to remain forever a blind impulse.

"It must unfold; on the one side, into conscious and spiritual motherhood, and, on the other, into the ideal childhood, whose love and yearning and prescient hope testify that it holds the 'all' in its heart.

The "Mutter und Koselieder" is Froebel's especial gift to mothers. In it he gives a series of instinctive actions incident to all childhood and the natural responsive acts incited in the heart of the mother. Professor Preyer says:

"The instinctive acts of man are few in number and hard to recognize after early youth is passed." And he adds: "So much the more attention should we pay to the instinctive movements of new born babes, sucklings and small children."

Of the transitoriness of instincts there can be little doubt. Some seem less transient than others. Many instincts seem to reopen at a certain age and then fade away. Consequently if, during the period of an instinct's keenest activity, we supply the proper response, we may form a habit which shall last long after the instinct which has given it birth has died away.

Professor James in his "Talks to Teachers" says:

"In children we observe a ripening of impulse and interests in a certain determinate order. Creeping, walking, climbing, imitating vocal sounds, constructing, drawing, etc., possess the child in succession, and in some

children the possession while it lasts may be of a semi-frantic and exclusive sort. Later the instinct in these things may wholly fade away. Of course the proper pedagogic moment to work in and to clinch the useful habit is when the native impulse is most acutely present. In this way you economize time and deepen skill, for many an infant prodigy, artistic and mathematical, has a flowering epoch of but a few months."

Froebel speaks of these instinctive actions as hints from heaven unto the mother given, through outward inner life to waken:

"Watch a mother's answering
Play when her happy baby kicks:
She will brace her hands to please him,
Or in loving sport she'll tease him,
With her playful tricks."

This is not mere fond caprice.

"God inspires the pretty strife.
She is leading a beginner
Through the outer to the inner
Of his groping life."

To illustrate: The child lying on his pillow, fresh from his bath, feels the vigorous life within so strong that he tosses his little limbs to and fro. The impulse to foster this life, dear mother, is at the very core of your being, for well you know without activity there can be no growth; well you know that these little limbs now tossing about in uncontrolled glee must learn to obey the will of their owner, else they may lead him into by and forbidden paths. And so you seize the little legs and arms and move them gently back and forth, adding to your action a loving look and a crooning song. So much for instinct. What has really happened? Free, unconscious action on the part of your child. No motive, no will, simply unimpeded impulse first. Limiting his action, you arouse a desire to push away whatever opposes his free movement. This desire, coupled with the opposition, causes him to exert more strength. Using his strength, he becomes stronger. Directing his activity, he feels a power within himself, while repeated plays develop the habit of surmounting with joy whatever obstacles oppose the free outputting of this life within. Slumbering in this embryonic instinctive play lie the principles which govern all future growth. Effort is the law of all growth, whether in plant, ani-

mal or man. The plant breathes, absorbs, assimilates and makes over environment into itself, changing outside elements into leaves, flowers and fruits. The animal, through his skill and cunning, satisfies his needs and grows keener through so doing. To man alone is it given to master not only environment, but himself. He it is who in the childhood of the race gives us a flying Mercury and seven leagued boots, and later concretes that vision into railroads and ocean greyhounds. Many are the steps between the vision and the reality. Many are the steps between the child's kicking, walking, running, climbing and all the athletic sports which are sweeping over our land to-day, giving us better bodies and more normal minds. But they all follow the same law of effort and limitation. Just a first step to-day to mother and two steps to-morrow; just a jump of a foot high to-day and the bar is gradually raised as the strength increases. But your child must kick and struggle, for life is activity. And so the mother may trace in all instincts the genesis of actions, which extend through later life, and with the added insight of the kindergarten may evolve the principles which, applied well, win for mother and child conscious action, rather than blind impulse.

The whole world is saying to your child, "Come and feel of me, I am form; come and smell of me, I am odor; come and taste of me and learn of sweet and sour, of bitter and salt; come and listen to me, and learn of music, for I am sound; come and look at me, and learn of beauty and color. To you I am revealing my inmost life. Learn of me and you will better understand God." And so the activity of the life within the child, uniting with the world around, develops a dawning perception of his own body and the uses thereof. With a gradually increasing discrimination between the various senses and the value of each comes a corresponding knowledge of a power within, born to master not only the outside world of material things, but an inner world of invisible feelings and desires. Emerson tells us: "He has not learned the lesson of life who does not every day surmount a flaw."

In feeling the child gets his first faint

sparks of religious life. In the tossing game, where the father throws the baby above his head, there grows a faith that father will not let him fall, and each time of separation increases confidence in his protecting power. All along the line, in each childish play, the seeds have been started which shall blossom into deeds. First the finding of the external self in peek-a-boo, later the finding of the inner self, or the voice of conscience. Then comes a time when the child discriminates between inner and outer. "Mother, what's back of your eyes," said a little boy of three one day. "Mother, what are you meaning?" said another little maid to her mother, who was thinking intently. And as the child discriminates between the seen and the unseen, he begins to feel a new power within himself, which he comes to recognize as "I am."

Take your child out on a windy day and let him feel the invisible forces of nature. Let him query, struggle and question. "What makes the wind blow, mother?" A critical time in a child's life is when he asks you about some phenomenon in nature that has unseen power. Then, and not till then, should you begin to talk of God. The great symbols of nature have stood all through the race period of development as the lenses through which the soul has first seen God. "The wind bloweth when it listeth and thou hearest the sound thereof, but can'st not tell whence it cometh or whither it goeth." So is every one that is born of God. To respect the undeveloped nature of the child and to nourish the capacity for real living is to nurture the seeds out of which holiness may spring. "God could not be everywhere, so he made mothers," said Lew Wallace. But God is everywhere, and the mother must study the history of the world that she may trace the progress of spirit, as working its way through form it comes to a consciousness of self. In nature, as force, life shows itself as light, heat, electricity, color, form and sound. In man it rises to human thoughts and feelings, which crystallize into the institutions of family, State and Church. Trace the progress of any great work and you will find the same story retold. Go with Dante into hell, where all forms of sin are portrayed in

their hideousness and deformity, and learn the genesis of evil. Rise with him on the rounds of the ladder, step by step, until, purged of selfishness and guided by insight, he is led into the presence of the Vision Wonderful by the hand of love.

Study with Goethe that you may solve with Faust the problem of life. Satiated with intellectual life, he sells his soul for youth and the gratification of sense. See him at last learning the redeeming power of love, and realize with him that only as a man loseth his life shall he find it again. Listen to Wagner as he traces in music the story of the love for gold, and that other love which led Brunhilde to sacrifice not only gold, but herself, and learn that life and education are one, and that true culture is living in the realization of the spiritual destiny of man.

Bishop Spalding tells us that

"Life is the unfolding of a mysterious power which rises in man to self-consciousness, and through self-consciousness comes to the knowledge of a world of law and truth and love, where action may no longer be left wholly to the sway of matter or the impulse of instinct, but may and should be controlled by reason and conscience; to further this process by deliberate and intelligent effort is to educate."

With deeper insight we may truly know and give to our children not only physical, but spiritual birth. We may concrete in each individual experience the relationship of the divine mother and her divine child. Seeing the beginning of life in the light of universal ideals, we shall hasten the process by which humanity is mounting upward to a clearer consciousness of the meaning of life.

NEW YORK CITY.

Experiences of a Street Car Conductor

[The conductor who gives the following succinct sketch of the work and everyday life of one whom the general public is prone to regard as a functionary of comfortable habits has earned his living on street car platforms in many large cities of the United States. He still earns his living in that way and is not altogether dissatisfied with it. There appears to be a very obvious moral of industry and industrial conditions to be drawn from the significant fact that the men who handle the electric switch in front of a car and pull the bell rope at the back are, in a large majority of cases, qualified mechanics whom conditions of their trade make eager applicants for places where work is just as hard and hours even longer.—EDITOR.]

WORKING on the back platform of a street car is generally the last resort of a man who has lost everything but industry. I do not say this to belittle conductors or motormen. I consider it high praise. What I mean is that I know of no form of labor, however difficult, that is harder than working on a street car. Many men who fail in business, cannot make ends meet in their profession, or lose clerical positions, say "No, thank you," when they are offered positions on the cars. They would sooner beg, steal or live off their friends. You may rest assured that the conductor or motorman, whatever his faults, is not afraid of hard work. It must not be assumed that it is easy to secure employment on the cars. In the last few years there has been a slight improvement in the hours and a slight increase in the pay,

and there are hundreds waiting for men to die or resign. Some of them do one or the other, after a while; and now and then—but rarely tho—some man is discharged. In my time, and since the introduction of the trolley in Chicago, where I first went on the cars, there has been a distinct improvement in the class of men who seek the work. And yet the business is not made up wholly of Chesterfields and college professors. It could not be.

Sarcasm? Not at all. Let me illustrate. When I had been railroading a week I had, one night, a very crowded car. A crowd of men and women blocked up the back platform. I called:

"Move up front; there's plenty of room up front."

But they stood there and never moved an inch. I had actually to push them

up front. I had been working over ten hours and was not feeling any too well, and I did not use very choice language. When the crowd thinned out and we were near the depot, a man with a high silk hat and a fur lined overcoat came out and lectured me. He said I was rude and he had a notion to report me. He told me I should treat each passenger as if he were my guest, and as if I were anxious he should go away pleased. I was angry and retorted:

"Do you suppose if I could talk and act like that I would be working for \$2.10 a day during a blizzard?"

That was enough. He did not say any more; but he reported me, and I did not have a chance to resign.

I could not secure the transfer to another line. Finally I left Chicago, with permission to use the company as reference.

I went to Pittsburg, where I obtained work easily. It paid 24 cents an hour for a day of ten hours, the best wages paid street car men in the United States. I remained in Pittsburg for a year and liked the place. While I was there the papers had a violent discussion over the question of public ownership of street railways. It never amounted to anything. My own opinion is that municipal ownership would not be a good thing. The service generally becomes run down at the heel; the class of men employed is decidedly inferior, and it costs the public just as much in the end. Private ownership means that a few men get very rich; but the service is put on a business basis, the morale of the force is elevated, and the people come pretty nearly receiving the worth of their money.

I do not want you to suppose that I had a sinecure merely because I was satisfied with my position. I have a philosophical nature, and that has always helped me on my journey through life. My little troubles and grievances would fill a good sized book.

A conductor on a trolley car can scarcely call his soul his own. This may sound strange to the casual observer, who regards the conductor as a petty tyrant, lording it over his poor passengers. As a matter of fact, he is subject to the whims of the most insignificant person who enters his car. Any one can report

him for incivility or—worse—lie about him, and he has a black mark put down against his name at the office. Then there is that awful book of rules and regulations. Every man employed by the company has to have one, and every man has to learn the regulations by heart. He soon discovers that there is a fine and a threat of dismissal for nearly everything under the sun—except breathing. He finds minute directions telling how he is to act and talk in every possible emergency.

He has to be most careful in case of accidents, whether they are serious or trivial. If John Smith sprains his foot in alighting from the car, the conductor must interview John Smith, and, if possible, examine his ankle; and he must secure the names and addresses of five or six persons who saw John Smith sprain his ankle. Of course that is reasonable enough; but the same thing cannot be said of some of the other rules. For instance, if a reckless driver comes along and runs the pole of his wagon into my car, breaking a window, I am compelled to pay for that window. Then again, if Brown's wagon scratches some of the paint off the side of the car, I am compelled to make that good or lose my position.

A conductor's lot is never entirely a happy one. During the summer he risks his life every time he goes to collect fares along the edge of the foot-board on either side of the car. He is liable to collide with a brick pile or a lime kiln at any time; and, when it occurs, he is either killed or laid up for repairs. In the winter time he is on the back platform, half frozen. It is only fair to say that the inclosures around the platform of the cars of to-day are a great protection during inclement weather. I do not believe the companies deserve any particular credit; it took a special act of legislature to make them do it. Then a man never knows when he is going to get a meal. He jumps up before daylight in the morning, gulps down a hurried breakfast, and hurries to the depot to take out his car. He cannot afford to be a minute late. That would be a mortal sin, not to be forgiven. Patti could disappoint an audience, but a car conductor must never fail to be on time for the public.

When the dinner hour arrives a small boy who lives in the neighborhood of the conductor's home, or some member of his family, hails the car and passes up the dinner pail. He cannot eat the dinner until he reaches the depot, and by the time he reaches the depot the food is cold. When he is through for the day he hurries home for supper. He is no sooner through than he has to go to bed so that he will not oversleep himself the next morning. It is not a bed of roses.

Being a single man, I was not affected by the loss of home life. I boarded with a conductor's family, and the sacrifices he had to make were really disheartening. He hardly knew his own children, and certainly did not have a chance to enjoy the society of his wife. She was a tidy, good-natured woman, who knew how to cook and take care of a house. Her husband earned, on an average, \$48 a month, and \$12 was paid out in rent for a comfortable two-story house that had a neat bathroom and some other modern conveniences. He kept \$5 a month for his tobacco, shaving and other personal expenses. To my way of thinking it was quite moderate. With the remainder, amounting to \$31, she kept the table, clothed the children and provided for her own wants. The \$4 a week board I paid her should be added to the total income. I cannot see, for the life of me, how she ever made any money on me; the table she set was enough to eat up the whole \$4. She was a natural manager, and with habits of economy was able to do these wonders. That family lived happily and was able to keep out of debt. I do not pretend to say that the family of every railroad man can live so well on the same amount of money. So much depends on the wife. If a man is fortunate enough to marry an industrious and economical woman, she can make ends meet, no matter how much he makes, providing, of course, he works regularly and turns the money over to her at the end of each week.

Just when I thought Pittsburg was going to be my home, I lost my position. One day two drunken men boarded my car. They began to sing and soon became profane and abusive. I went inside and quietly asked them to stop.

They did stop for a minute, and then became worse than before. Several of the male passengers began to offer hints for my benefit.

"If the conductor knew his business," one remarked, "he would throw these fellows off the car."

"Yes," said another. "But did you ever meet a conductor that had the courage to do his duty?"

This decided me. I went up to the nearest drunken tough—for that is what the man was, inside the clothes—and said:

"If you don't quit your abusive talk you'll have to get off this car."

"I dare you to put me off," he retorted, with a leer and a fresh flow of profanity.

I pulled the bell rope, stopped the car, took my man by the back of the neck, and threw him into the street. The women passengers shrieked; the men, sitting as still as Chinese idols, never offered to help me. Tough Number Two came at me. In self-defense I had to fight. When I got through with him he was a sorry vision. I tore his clothes, blacked one of his eyes and blooded his nose. He hammered me pretty hard, too. They had plenty of money, for they hailed a cab and drove off.

When we reached the depot the superintendent was standing there, evidently waiting for me. By his side was the man I had thrown from the car. He looked at me with a one-eyed haughtiness and, turning to the superintendent, pointed his finger, saying:

"That's the man."

The superintendent regarded me quizzically, saying, in angry tones, but with a half smile, lifting the corners of his mouth:

"You are discharged. Take your badge into the office."

"But," I cried, "can't I tell my side of the story?"

"There's only one side to this story," he replied, grimly.

"Why?" I asked, with open-mouthed wonder. "Because I licked that dirty blackguard?"

"No," he said, lowering his voice; "because the man you licked is the son of one of our directors."

That night I met a man who had two passes east, and we resolved to try our

chances in Philadelphia. We got positions at once, only to find out that a strike was going on. I did not like the idea of working as a "scab," but I could not afford to throw up my place. The strike lasted seven days. For two days I did not do a thing, and the other five days I made one trip a day, surrounded by four big policemen and dodging now and then a rotten potato, decayed eggs and an occasional brick, heaved into the back platform by the sympathetic friends of the strikers. I received \$2 a day and the assurance of being retained, no matter how the strike ended. The papers said those seven days were a reign of terror; I could not see it in that light. It took nerve to work—that was all. No one was killed; possibly three or four men received scalp wounds from missiles thrown by boys.

The men went back with the assurance that their condition would be bettered. It was not bettered immediately, but it has been since. The pay and the hours are now better than were asked for when that strike was ordered, six years ago. The pay is 20 cents an hour, for a day of from ten to eleven hours. Incidentally, the municipality has exacted good terms from the corporation. The street car companies were given the right to use the trolley system on condition that they would pave and keep forever in repair the streets on which their cars are run. This, I venture to say, has made Philadelphia the best paved city in the Union.

Every conductor there is subject to petty annoyances, both from the passengers and the subordinate officials of the company. A rule prohibits us from entering into disputes with passengers, and yet there are times when the observance of the rule is out of the question. A man comes to you five minutes after he has paid his fare and says the change is 10 or 15 cents short. On two occasions, when I felt morally certain that I was right, I gave up the additional money rather than provoke a quarrel and be reported for incivility. A count of my money on those nights proved that I was in the right.

Perhaps the hardest feature of a conductor's life is the "swing" system. By this arrangement, altho a man may only

actually work ten or eleven hours, he really has to be on duty for fourteen or fifteen hours. For instance, I take my car out at six o'clock in the morning. I make two trips, which consume four hours, and then I am relieved for four hours. I return at two o'clock in the afternoon and work until ten o'clock that night. But I receive pay only for the time I am actually on my car. I consider this hard usage, and yet I do not suppose it is possible to avoid it.

At one time drunkenness was not uncommon among the drivers and conductors on the street cars, but the introduction of the trolley has changed their habits for the better. A street railway is run now like any other large and progressive corporation. As a result the character of the men is a grade higher than it used to be. Drunkenness is a fault that is never forgiven in a man. If you lost your place through drunkenness to-day and should apply for it ten years hence, you would find that black mark still against you. The habits of the average conductor and motorman are good now, and few are dismissed for drinking.

What is worse than riding in a Philadelphia street car, especially during holiday times? The people are crowded in like sardines; they trample on toes, and the jerking and the sudden stopping and starting often throw them into one another's laps. A conductor sees it all more vividly than the passengers, because he is a spectator, while the others are the actors. One thing is certain, and that is Americans have a sense of humor—a saving sense of humor. It enables them to bear with all kinds of discomfort and imposition and still feel reasonably happy. They may make a protest—a good, vigorous, verbal protest—but it usually ends there. An American will laugh at a thing that would cause an Italian or a Spaniard to shed blood. This may be platform philosophy, but it comes from years of observation on the back of a street car.

After being in Philadelphia for a little over a year, I was taken with rheumatism, the Nemesis of railroaders. I was laid up for two months. When I went back the superintendent said, in view of the fact that I worked during the strike,

he would take me on again if I would wait for two weeks.

I concluded not to wait, and went to Brooklyn, the heaven of the dishonest railroader, where the conductors steal everything but the tracks. I had never been dishonest, so I did not begin there. I stayed in Brooklyn long enough to see that the companies had a network of protection throughout the country against dishonest and careless railroad men, and Brooklyn seemed to be the mouth of the scoop.

My last move was to New York, on the Broadway surface line. I like New York. It's a pretty good town. I think I'll spend the remainder of my days here.

A conductor sees the worst side of human nature. What is there in the atmosphere of a street car that makes men and women, even on Broadway, act with such vulgarity? Why will men spit on the floor? Why do they send their feet sprawling all over, at the risk of tripping

up every newcomer? Why do they spread their newspapers out so as to obstruct the view of their neighbors on each side? Why do they quarrel with the conductor? And why do they remain seated while women are standing? And the women—why are they so cross and irritable? Why do they accept a seat from a gentleman without thanking him for it. And why do they try to palm off nine and ten year old children as being "under four"?

But, in spite of all these things, and a good many more, I like my job and I am willing to keep it. To get 20 cents an hour and have the glorious privilege of living in New York is no small thing to me. My health is rugged. I feel that I could almost digest cobble stones. It may seem queer to some persons, but I am sincere when I say that I would sooner be a street car conductor in New York than a leading citizen in a country town.

NEW YORK CITY.

Notes on General Army Staffs

By Georges Picquart

LIEUTENANT-COLONEL OF THE FRENCH ARMY, CASHIERED

[Colonel Picquart, "the hero" of the Dreyfus affair, is an authority in France on all military questions. He has long been familiar with the American army, having, among other things, carefully followed, while in prison, the Cuban campaign. It will be noticed that Colonel Picquart's title is accompanied by the words "en réforme" (cashiered), which always appear on his visiting card and in his sign manual. These words carry with them an unmerited stigma which the French War Department would now be only too glad to remove. But the friends of Picquart state that he will not lend himself to such a cowardly action, but demands the condign punishment of those high officers who have persecuted him and Captain Dreyfus, and who have not yet been treated, he considers, according to their deserts. This article is especially timely at the present time, since the United States has adopted the General Staff (for the command of its army), the law going into effect this week.—EDITOR.]

AMONG the measures recently adopted for the reorganization of the United States Army there is one whose importance is capital—the creation of a General Staff Corps, at whose head will be a general as Chief of Staff, acting under the superior direction of the President or of the Secretary of War. My aim in writing the following paragraphs is to examine some of the consequences of this innovation in the American army.

In the first place and in a general man-

ner, it is well that the real meaning of these changes should not be misunderstood. If the great American Republic is striving to improve its military institutions in such a way as to obtain the best possible good from its army, it does not at all follow that there is any likelihood of the United States imitating certain European nations in loading itself with a vast military establishment. It is evident that nothing is further from its purpose, especially as armaments of this kind are quite unnecessary in America.

The geographical situation of the country protects it from the danger of a sudden invasion, which might threaten at any moment most of the European nations. At the beginning of an unexpected conflict the United States need fear only isolated attacks aimed principally at its

there would always be time, before any serious blow could be delivered, to strengthen the regular army, to call out the militia and to raise and equip those volunteer regiments whose aid has never failed the country in time of need.

It is quite true that such a military organization, based on the combined employment of permanent and volunteer forces, would not permit, at least at the beginning of a war, offensive operations on a grand scale. Such a course is possible only where trained reserves stand ready for immediate incorporation into the regular army. The American system, however, suffices—experience has proven the truth of this remark—to furnish the number of men needed for the protection of the country, and even for carrying on important offensive operations, after a certain lapse of time when the volunteers have acquired sufficient cohesion. This delay could be shortened, however, if the organization of the volunteer system were improved.

But in order to accomplish something in war, good soldiers led by excellent officers are not the only things required. The general direction of the campaign must be in sure and competent hands. Formerly, when armies were not large and their passage from a peace to a war footing was a simple affair, and was accomplished almost leisurely; when they marched and fought in compact bodies, the duties of the commander-in-chief were almost direct in their nature, and he did not find it necessary to have so much recourse to the aid of others. But this is no longer the case to-day. An army on a peace footing constitutes only a small part of this same army entering upon a campaign. And when war is declared, a nation, if it is not to be placed at a disadvantage, must get its army into the field with a rapidity that was never dreamed of not many years ago. Mobilization, as now practiced, has become quite a science.

The railroad and the steamboat are now utilized for concentration, and, in order to avoid disorder and confusion, the arrangements must be made with the greatest care. The troops who are marching and fighting may cover an immense extent of territory; feeding armies under such conditions is in itself no easy

* LIEUTENANT-COLONEL PICQUART

coast towns or its new outlying possessions. In order to parry these blows, all that is needed is a strong navy, and, on land, a few well-chosen points as permanent centers of defense, which could be easily kept up without this weighing heavily on so rich a Power as the United States. If circumstances demanded it,

or simple task. The bigness of modern armies, the perfection of the arms used to-day, and the progress made in every branch of military science, as well as the handling of such masses of men on the field of battle, offer difficulties unknown to the old armies operating in serried ranks. It is therefore indispensable that the *commandement* be well organized and the duties be distributed in such a manner that there is no violation of the two essential principles of the proper division of the work and the complete unity of action. It is also necessary that the commander have at his disposal a good general staff, composed of active and experienced aids, who enable him to give his orders understandingly, who transmit these orders intelligently, who facilitate their execution, who, in a word, devote themselves to the details, which are so important, but about which a commander cannot occupy himself without undertaking a task to which even the ablest minds are unequal.

The system of organization which prevailed in the American army has up to the present time been very different from that which I have just described, tho this latter system assures the best preparation for war and for the good working of the post of commanding general when the moment comes for beginning a campaign.

The American Secretary of War, not having at his disposal this excellent organism known in other armies as the grand general staff, lacks the elements necessary to give a unity of action to his department and military are subordinated to administrative considerations. The different divisions of his department perform their work, therefore, on parallel lines with a total absence of military co-ordination. This tendency to reciprocal independence is increased by the fact that the officers attached to these different divisions become permanently specialized in their respective spheres, and do not enjoy the benefit of having their views enlarged by a change of service or by returning from time to time to active army life.

On the other hand, the Commanding General of the American army, occupied principally with matters concerning the *personnel*, discipline and instruction, ex-

ercises no authority over the departments of the Secretary of War. His only collaborators are his aides-de-camp. He is in a position, therefore, neither to study nor to arrange the practical details of a system of mobilization, nor to draw up a plan of military operations of any practical value.

Finally, as in time of peace, the regiment is the largest unity known in the American military system. It is only at the moment of mobilization that brigades, divisions and army corps are created. So not till this most critical period is entered upon are the general staffs of these new unities formed and come in contact with one another or with the different corps and services. And the crying disadvantages of this system are still further increased by the non-existence of a corps of general staff officers, so that the officers called upon to make up these improvised staffs have not been subjected to special selection and instruction, as is the case in European armies. The faults of such a condition of affairs came out so plainly five years ago, at the time of the Spanish-American War, that it is unnecessary for me to lay stress on the matter.

The new law already referred to will do very much to remove these evils. It is true that the whole system of commandership is not to be reformed from top to bottom. The head is alone modified. But by providing the central organism, which controls the whole military machinery, with a strong and rational organization, an immediate and capital improvement is secured and a good start made toward further amelioration.

The most important features of this new law, which for reasons of a personal nature will not go into operation till the month of August, are as follows:

It will create a body of general staff officers whose duties it will be to elaborate plans bearing on the military defense of the nation, to make themselves familiar with everything bearing on war preparations, such as mobilization, etc., and to be ready to aid general and all army commanders in matters pertaining to general staff duties.

It will also create a Chief of Staff, who, under the direction of the Presi-

dent and the Secretary of War, will be charged with a general control over all the regular army bodies and services, including the different bureaus of the War Department. Thus will be secured not only the administrative unity of the old organization, but unity of military supervision also. The work of the various departments can thus be co-ordinated in view of the necessities of war.

The new law will also cause to disappear the post of Commanding General of the army, whose powers were, in truth, reduced almost to nothing.

The new law is silent on the question of the creation of grand army commands when the military establishment is on a peace footing, such as army corps, divisions, etc. I do not know whether an organization of this kind enters into the plans of those who are now engaged in remodeling the American army. But if it does, this further step is made all the easier by this creation of a general staff corps, which would furnish the necessary officers. But even if this step is not taken, it is an immense progress to have ever ready in the general staff a body of officers designated in advance for the staffs of the army corps, divisions, etc., which will be formed in case of war. If these officers are employed in studying the questions relating to the unities to which they will be attached when war breaks out, they will be given an excellent training for their future duties.

The good that will be derived from this new corps of officers will largely depend upon the way in which it is recruited and directed. The law decides that those employed on the general staff may remain, at most, but four years in that post, and that they may not return to it until a lapse of two years. This is an excellent provision, which will render the staff officers alert, will keep them in touch with the active army and prevent them from getting rusty in bureau life. In time of peace the general staff officer is too apt to lead a sedentary existence. The periods of grand manœuvres and general staff journeys furnish only a brief change. It is indispensable, therefore, to vary their service from time to time, so that they do not get torpid. It

is a grave error and widely held that a good staff officer need be simply a sort of clerk. This opinion was generally prevalent in France previous to 1870, when the Franco-German war showed us, to our cost, what a mistaken idea this was.

During a campaign the staff officer is with his general at the front, while the troops are marching and fighting. He should, therefore, be a sturdy horseman in order to perform all that may be required of him. Then when the troops are resting a new task begins for him—office work, which consists in preparing the military operations and assuring the material welfare of the army. To this list of duties should be added special reconnoissances, receiving, carrying and explaining orders, etc. The general staff officer should, therefore, be exceptionally well tempered, physically, morally and intellectually, and hence it is that he should be selected with the greatest care. For this reason it is highly probable that the example set by Europe in this matter will be followed in the United States, where it is all the more necessary that this be done, as in the latter country political influence might be more apt to outweigh sometimes professional proficiency. I mean that the choice of these officers should be based on a competitive examination, and followed by a sojourn in a special academy or military college, where the candidates would be given an advanced course of professional training, and where they could be closely watched during a long period of months before being selected to enter on probation the lower grades of the general staff corps.

I should like to point out in closing the advantages which the United States may hope to derive from the adoption of the new measure.

The larger an army becomes when it passes from a peace to a war footing, and the greater the amount of new material found in its ranks at the moment of mobilization, the more necessary becomes a solid and permanent feature in its organization. This end can best be attained by having a general staff always ready. Neither a few days nor a few months can give a man, however able he may be, the knowledge and practice necessary to form a competent general staff

officer. Furthermore, without a permanent general staff, you cannot have always ready the machinery required to send an army promptly into the field when a call to arms is issued. Nor does this observation refer alone to matters of simple organization. Constant preliminary studies bearing on possible military operations should be carried on in every country. In America the field for such work is wider than anywhere else, because of the variety of hypotheses which may be considered, of the probable extent of the theater of the operations and of the necessity of taking into the account always the navy, for it is impossible to conceive of American troops engaged in a campaign without the co-operation of the fleet.

I may add that the keeping up of a general staff, even in a very complete form, and where the army on a war footing is large, may be realized very easily by a small regular army in time of peace. In some countries—France and Spain, for instance—there are officers without

men, who find the latter awaiting them only at the moment of mobilization. It is a bad institution, for these officers are without soldiers, with nobody to command, and something has to be found for them to do during a peace. But to them should not be compared officers of a general staff, whose labors during peace are of practical value when a war breaks out, and who, furthermore, find occasions to continually practice the duties that will be required of them in case of war during the general staff journeys and the usual military maneuvers. Again, nothing is less costly than keeping up a body of general staff officers because so few are necessary. For instance, the new American law calls for only 45. This is, indeed, a very modest figure, and cannot do much to increase the cost of the American military establishment. It can safely be said that if the reform is well carried out, the advantages derived therefrom will be all out of proportion to the slight demand on the Federal treasury.

PARIS, FRANCE.

The Last Whinny

By Blanche Nevin

GOOD-BY, Champagne, my pretty Champagne,
With the white tail and the foaming mane,
Good-by, forever and ever again.

Friends were we through the summer weather,
Climbing the mountain roads together,
Nipping buds in the heart of the wood,
I sang, you whinnied, each understood,
And the sky was blue and life was good.

There were the streams and under the dint
Of your slender hoofs the fragrant mint;
There was the moss, and the wild grape vine,
The rhododendron, laurel and pine,
The honeysuckle, the columbine.

Remote from struggle, away from care,
Peace profound in the rarefied air;
Without temptation to sin—no need
To worry ourselves with anxious creed;
The very God seemed with us indeed.

Good-by, Champagne, my pretty Champagne,
With the white tail, and the foaming mane,
Sad on the mountain sobs the rain.

It's likely I'll go to Heaven some day,
When this poor body is sloughed away,
If I am good and absolved of sin,
But that is a goal you cannot win;
For Heaven they don't let horses in.

I am glad you do not understand
That this is the last touch of my hand;
That into Heaven you cannot get,
That you don't know why my cheeks are wet
As you bend to me your neck to pet.

Now here are queries to pose the knowledge
Of each trustee of Carnegie's college:
Why I have a soul and you have none;
Why you must perish, and I go on.
Which to day is the pitiful one?

Happy it is in Heaven, no doubt,
Yet, surely, some day, I will look out;
Mine eyes through infinite space will strain
For a glint of snowy tail and mane,
As you whinny, whinny, once again,

Good-by, Champagne, my pretty Champagne,
With the white tail, and the foaming mane,
Out of the shadows whinny again!

CHURCHTOWN, PA.

LITERATURE

Mazzini

THE figure of Mazzini grows greater with the efflux of time. A visionary, it has been said; but, as time proves, he was one whose visions, in part at least, come true. He was often inconsistent, often unpractical, both in what he did and in what he urged others to do. But his inconsistencies are only the minor details of a uniform and unyielding policy which he followed throughout life, while the precepts and acts wherein he was unpractical were those of a kind common to all great reformers, whose gaze is too fixed upon the shining goal to be always aware of near-at-hand obstacles. The intricacies of his thought and character Mr. King admirably analyzes;* and the personality that is revealed to us is one that must win the respect and love of all good men. The study is scholarly and sympathetic, the work of one whose previous volumes on modern Italian history prove his knowledge of the period and the man, and whose reverence for his subject is neither blind nor biased.

Few men have lived out a greater tragedy than did Mazzini. From his youth, except for the brief time of the Roman Republic (1848-49), he was an exile. Always poor, and generally overburdened with debt; hard worked, hard pressed, persecuted and driven from place to place on the Continent, and even in his English haven subjected to the rifling of his mail by Government officials; defeated or thwarted in all his projects; betrayed by confidants, forsaken by sometime friends and even by members of his own family, he yet bore up under it all, and for forty years he untiringly carried on his heroic campaign for justice and humanity.

Before he died he saw throughout western Europe the tremendous uplift of democracy; a sensible, if not revolutionary, betterment of the condition of the workers; a general diffusion of social ideals. He saw also, tho with less elation, the unification of Germany, and

with deep satisfaction he witnessed the humiliation of France, which had destroyed the Roman Republic in 1849 and had betrayed the hope of Italian unity in 1859 by the peace of Villafranca. Lastly, he saw Italy united, with Rome as her capital. A less aggressive, a more compromising spirit, bowed as was his with a weight of 65 years, would have found satisfaction in these events and sought repose. But Mazzini knew no rest. Democracy, the cause of the workers, religion, duty, still held him untiringly to their service, and the unity of Italy under a monarchy, instead of a republic, appealed to him as a shame and mockery of all that he had striven for. "I thought to call up the soul of Italy," he said, "and I see only its corpse. . . . I want to see, before dying, another Italy, the ideal of my soul and life, start up from her three hundred years' grave; this is only the phantom, the mockery of Italy." Amnesty was twice offered him in his later years, but he declined it, and he died unreconciled.

The consistency and unity of his life, as Mr. King shows, "comes of this, that all was dominated by a scheme of thought that controlled and correlated each sphere of action." At the center was religious faith, and to him religion was "the breath of humanity, its soul and life and consciousness and outward symbol." The religious sense he held to be enshrined in each man's conscience. In every age men have asked "to know, or at least to surmise, something of the starting-point and goal of mundane existence. . . . From the general formula that men call religion issues a rule of education, a basis of human brotherhood, a policy, a social economy, an art;" and he declared that he did not know "a single great conquest of the human spirit, a single important step for the perfecting of human society, which has not had its roots in a strong religious faith." As a historic judgment this is open to considerable doubt, unless a sufficiently elastic definition of religion is granted; but Mazzini probably held it

* MAZZINI. By Bolton King. [*The Temple Biographies.*] New York: E. P. Dutton & Co. \$1.50 net.

true under even the most restricted meaning of that term.

His own religious creed was neither Catholic nor Protestant. He hated the Papacy, and sometimes comforted himself with the belief that before the end of the century it would be extinct. Yet for Protestantism he had, if not hatred, at least a critical antagonism. He protested against "its exaggeration of the individual, its rejection of tradition, its sectarianism, its 'indefinite dismembering of the common thought.'" For Christ and his teachings he had the most fervent reverence. But of formulated Christianity his summing up was this: that it "tells each man to perfect himself by his own strength and God's; but his spiritual growth is conditioned by the growth of the men around him, and therefore his own perfecting depends on the progress of the race, the common search for good, that links all men together and the generations to one another." He hoped for a new faith which should grow out of and supplant Christianity.

His ethical code—"very Christian in its spirit, essentially modern in its application"—sought to embody the noblest morality answering to the needs of a democratic society. The theory of rights he attacked with all his strength, and both the Physiocrats and the Utilitarians were the objects of his undying aversion. Duty was the basis of his code. Life was a mission, and upon all rested the obligation to strive to the uttermost to make the ideal the real.

From religion and ethics he came to the social question—the "most sacred" and "the most hazardous" problem of the age. His deepest sympathies were with the disinherited of all lands, and it was with a fiery indignation that he wrote of their sufferings. Yet it was not mere betterment of conditions that he urged. He declined to "substitute the problem of humanity's kitchen for the problem of humanity." "Material improvements," he wrote, directly addressing the men of labor, "are essential, and we will fight to win them; not because men have no other interest than to be well housed and clothed, but because your moral development is stopped while you are, as you are to-day, engaged in a continual fight with poverty." He urged

association, co-operation, state aid, the extension of democracy, but he fought with increasing bitterness the Anarchist-Communism of Bakunin and the Socialism of Marx. The latter, as Mr. King admits, he did not really understand; and it is evident that his theories had much in common with those of Marx. Yet in root principles there were fundamental differences, the material basis of the German's philosophy acceding ill with the spiritual basis of Mazzini's.

Much that Mazzini wrote is obscure, buried in a mass of verbiage; and the disentanglement of the thought from the dressing is sometimes an irritating task. His learning was often at fault, and his reason inhibited or dominated by his feeling; for his conclusions were as often emotional as rational. Yet with all allowances he remains one of the world's great spiritual heroes, pure in life, fervent in faith, untiring in his work for what he conceived to be the best interests of humanity. In giving so excellent a picture of this personality to the world his biographer has achieved a task of notable distinction.

The New Love

WE have had many definitions of love, and there have been traditions of enough enthusiastic lovers to prove them all. But in every instance love is represented as an emotional experience. We all remember what a time there was in history about Paris and Helen, and even Isaac lifted up his voice and wept when he saw Rebecca standing at the well. Apparently, the first time men recognized the sensation, it was a matter of feeling rather than of intelligence. And they by no means suspected that it was nature's way of "stirring abysmal fecundity." Nor did they understand it to be simply a different expression of the procreating instinct, by which all life propagates its kind. Every lover became a poet, a heaven-inspired demigod, ready to prove his valor or to risk his life in honor of love. Thus, for thousands of years, we have been accumulating a body of literature about this supreme emotion, pretty pastorals and scriptures of the heart that have swept each succeeding generation

further into the charm and mystery of it. And so far as we know no one was any the worse for the illusion; rather better, in that what had been merely a physical instinct became a gentle, almost spiritual, idea of devotion. The relation of the sexes to one another lost its primitive vulgarity, and this was supposed to be an indication of an advance in the scale of things, a sort of sublimating into ethical tenderness the lowest instinct.

But if we are to credit the views of the young scientist, "Herbert Wace," who in this volume* of letters discusses the subject with his foster father, Dave Kempton, an elderly poet in England, the sentimental idea of love is incorrect and is really the cause of much unhappiness and degeneration.

The letters grow out of Wace's announcement to Kempton that he is about to be married, for purely intellectual and bionomical reasons. And it is only necessary to note his point of view in this criticism, since the plea of the poet champion of romantic love is familiar. The substance of it is: "In the beginning love arose in the passion for perpetuation; to-day, the passion for perpetuation arises in love." There is a difference of many centuries' development between the two clauses of that sentence. But the scientist goes back of all centuries for his definition of love. He writes:

"I learn that there are two functions which all life must perform: Nutrition and Reproduction. And I learn that in all life, the performance, according to time, space and degree, is very like. The slug must take to itself good, else it will perish; and so I. The slug must procreate its kind, or its kind will perish; and so I. The need being the same, the only difference is in the expression. . . . And just as the fish and the reptile glimmeringly adumbrate man, so do these yearnings and desires adumbrate what man himself calls 'love,' spelled out all in capitals."

But he concludes that it is intelligence that makes the man, and only this that differentiates him from the fish, reptiles, &c. "The brain is triumphing over the belly and the heart!" he exclaims in one of those brutal, brilliant epigrams peculiar of his style (and so characteristic of Mrs. Charlotte Perkins Gilman's style

as to cause us to wonder if, after all, Mr. Wace can be a lady), and with many trumpetings proclaims himself free from the illusion of romantic love on one side and from the primitive passion on the other.

"I am not impelled by the archaic sex madness of the beast," he declares, referring to his approaching nuptials, "nor by the obsolescent romance madness of the latter day man. I contract a tie which my reason tells me is based upon health and sanity. My intellect shall delight in the tie. My life shall be free and broad and great, and I will not be the slave to the sense delights which chained my ancient ancestry. I reject the heritage. I break the entail. And who are you to say I am unwise?"

In short, according to Mr. Wace, love is a "disorder of the mind and body"—a confession of kinship to lower forms of life. And it is not a wise nor even a moral basis for marriage. He denies the necessity of emotion, and there is no room in his earthworm imagination for a loftier conception of love than that it is a functional instinct. Indeed, the whole mind of the man has materialized into facts. He is the victim of that form of insanity peculiar to the scientific mind—rationalism, unenlightened by spirituality. His business is to reduce every experience into its component part of matter and to express it by a formula of insensate protoplasm.

But what of the woman while these letters were being exchanged between her scientific lover and his friend, the poet? She furnished a *dénouement* quite beyond Mr. Wace's heartless calculations. To the average woman this bionomical view of love must seem nothing short of blasphemous, since for her it is the foreordination of suffering and sacrifice; it is the most sacred of all experiences. And she cannot therefore afford to debase her own consciousness with a merely scientific definition of it. Thus, when "Hester Stebbens" discovers that the undemonstrative manners of her lover are not the expression of a reserved and nobly silent nature, but the result of his purely bionomical relation to her, she retards the progress of sanity and materialism by declining to become the matrimonial victim of his scientific experiment. Mr. Wace is surprised, but there is not much of a scene, since he is too rational to feel ag-

* THE KEMPTON-WACE LETTERS. New York: The Macmillan Company. \$1.50.

grieved. But he remonstrates, in the interest of his scheme, tells Hester that her dissatisfaction arises from an "inordinate desire for happiness."

And in conclusion his explanation is worth pondering. Is not the passion for scientific development in this age alien to those speculative powers of the mind that we have been at such pains to cultivate and by which we are enabled to conceive of high and blissful experiences? And if this is true, what will be the effect of science upon life and art? Certainly, an acceptance of the bionomical theory of love will be a death blow to fiction, to say nothing of its effect upon the sexes in real life. And, after all, may not this intelligence which makes us men, beget a yet finer set of faculties which divine what the scientist can never demonstrate—a spiritual power by which we may ascend beyond the facts of mere materialism?

Questionable Shapes

MR. HOWELLS'S disposition for developing the nerves and emotions of his characters into psychic details often renders his novels morbid and tedious, but in short stories his method shows to a better advantage. For in these he gives an incident, portrays a passing situation, which does not leave the men and women with whom he experiments too much exhausted nervously to resume a normal state of being, as is frequently the case in his longer novels.

Of the three short stories in this volume* one is founded upon an "apparition;" the second contains a metaphysical discussion of "personification" and a pathological presentation of insanity, so that the logical result is the man's vision of Death, come as "The Angel of the Lord," to deliver him; and the third hints plausibly of psychic communication between the living and the dead. But in no case does the ghost really appear. Mr. Howells never gives Hewson's "apparition" a definition, nor stages his "Angel of the Lord." These are indeed questionable shapes that defy even his powers of description. Each is an illusion of mind, a conviction of con-

sciousness rather than of sight, meant by the author to represent psychic phenomena instead of playing the rôle of primitive "haunts." He is chiefly concerned in portraying the subjective effects of these supernatural suggestions upon characters who are intelligent, skeptical men and women of the highest social order who decline to revel in the vulgarity of merely creeping, ghostly sensations.

Thus it is not the supernatural that dominates the situation and absorbs attention so much as it is the mental conditions and movements of human beings whose lives have been for the moment enveloped in a ghostly atmosphere—an atmosphere so thin, by the way, so clarified by science and cynicism, that a love affair progresses through it quite naturally.

The peculiarity of Mr. Howells's method is that he so manages spiritual intuitions as to render them abnormal, then supernatural, and that he is still able to make this last degree of the incredible subservient to the natural, social order. Any man with a gruesome imagination can reveal a ghost to people only partially evolved from the superstitions of primitive intelligence, but it is another more difficult undertaking to project an impression of the supernatural into the minds of such sophisticated types as are set forth in these stories. The tendency, of course, is to vulgarize the situation by bringing the "apparition" at least into the dim candle light of observation. But Mr. Howells is himself so profoundly incredulous of the results of his own psychic jugglery that he never gives a poor spook the ordinary opportunity to tell lies in "questionable shapes." He simply takes advantage of popular interest in the uncanny to show certain phases of human subconsciousness, the deep pit of our aboriginal minds from which we have evolved reason and some other elevated faculties. And the impression gained is that when we have entirely evolved we shall be forever delivered from all superstitions or even suggestions of the supernatural.

He makes objection to such visions more convincing by avoiding every form of exaggeration. His very "apparitions" are rendered impossible by the

* QUESTIONABLE SHAPES. By W. D. Howells. New York and London: Harper Bros. \$1.50.

simplicity of his language. And he further encourages unbelief by keeping normal skepticism well to the front. Thus when Hewson defies the credulity of a whole dinner party with the announcement that he once saw a ghost, there is no sensation.

"Several people who were nearsighted or far placed put on their eye-glasses, to make out whether Hewson was serious; a lady who had a handsome forearm put up a longnette and inspected him through it; she had the air of questioning his taste, and the subtle aura of her censure penetrated to him, tho she preserved a face of rigid impassivity. He returned her stare defiantly, tho he was aware of not reaching her through the lenses as effectively as she reached him."

But this "defiance" is the dramatic retort of a man with a story to tell rather than of a believer in apparitions. Hewson evidently regarded his as a sort of mental subterfuge.

One thing must be said in conclusion, however—no man in America has a better conception of what a gentleman really is than Mr. Howells—kind, intelligent, commonplace men, absolutely without affectation and singularly sincere. They stand the tests of spiritualism and other weird manifestations with the calm tolerance of men who feel that material "shapes" give them the scientific advantage, and they conduct themselves accordingly. The question is how would these ideal club men act in a real emergency. They invariably impress the reader as being entirely contemplative and consequently more or less ineffective. Can any of them lead a forlorn hope, fight, suffer, or *do* anything except live smoothly, talk entertainingly, or perhaps occasionally provoke an attack of nervous prostration by penetrating too far into somebody's psychic regions? The fact is nothing really ever happens in one of Mr. Howells's novels. And it is a question what he would do if an historical novelist should meddle with his characters on the sly so that they showed, say, the dueling instinct. For Mr. Howells could no more develop a quarrel to the sword point, or even set a fictitious house afire, than he could use profane language.

The Call of the Wild. By Jack London. Illustrated; cloth. The Macmillan Co., \$1.50.

Amid the multitude of nature books that have recently followed one upon the other in rapid succession *The Call of the Wild* stands out as a notable achievement. The author with an art that is exquisite has taken for his hero the canine offspring of a St. Bernard father and a Scotch shepherd dog mother. To this dumb animal he has given a personality far more vivid and taking and one having a far higher human interest than is many a man or woman sketched upon the printed pages of a record-selling novel. The story takes us into the Klondike, with its stretches of ice and snow. It deals with the hardships of Arctic travel. It has to do with gold greed, with lost hopes, and with bitter disappointments. The varying temperaments of the men who owned the dog, from time to time, and some others, flit through the story, and the varying fortunes and evolutions of "Buck" are set forth until in answering the call of the wild he rises to the leadership of a pack of wolves. Mr. London has written a story that is more than simply readable, even tho it utterly lacks what some have thought to be absolutely essential to a story—the humanly sentimental element. The book is remarkable, and will add to the author's already excellent reputation.

City Temple Sermons. By R. J. Campbell, M.A. Fleming H. Revell Company, New York, Chicago, Toronto. \$1.00 net.

These sermons are interesting and valuable, not so much for the light they throw on any of the great religious or philosophical problems of the time as for the revelation they make of a most engaging personality, and for the index they furnish to the type of religious thought and life that is now popular. Dr. Campbell is just now very much in the public eye. As the successor of Dr. Parker in the City Temple of London, his position alone was enough to make him an object of much interest, but it required only a few months to show that his personality was far more conspicuous and commanding than his position, and

for the past year this vast church has been crowded as never before in its history. Similar crowds have everywhere greeted him during his recent visit to this country. What is the secret of this remarkable popularity and power? A great many things might be mentioned that undoubtedly contribute to it; a deep and original religious consciousness, personal magnetism of an eminent degree, downright honesty and earnestness, an absence of all literary and oratorical tricks, a happy mingling of rationalism and mysticism in his religious appeals. All these qualities are very evident in his sermons; but we venture to say that the unique power of his message lies not so much in these things as in what we may call his intense social feeling, his capacity of losing himself in the lives of those to whom he ministers. He has the sympathy and imagination to put himself most vividly in others' places, to suffer in their sorrows and wrongs, to be distressed in doubts and perplexities, to bear their burdens and to carry their griefs. His message is a social message; the redemption in which he is most interested and to which he is looking most eagerly is what he calls a "social redemption." In the coming religious conflict, he says, "spiritual men will fight the fiercest battles in behalf of the hungry, the poor and the sad, and for Christ's sake will be brothers to those who are less fortunate than themselves." The popularity and power of a man who is filled with such a spirit need no other explanation.

The History of Woman Suffrage. By Susan B. Anthony and Ida Husted Harper. Published by Susan B. Anthony, 17 Madison St., Rochester, N. Y.

This large volume is the fourth and last of the History of Woman Suffrage, and describes the progress of the movement from 1883 to 1900. A full account is given of the legal and political status of women in each State and in foreign countries, and of all legislation and popular ballots on the question. A summary is included of all debates in Congress and in the State Legislatures in which both sides of the argument are given with great fairness. In some respect the period covered by this volume

is more interesting and important than any of the preceding because during these years woman suffrage has passed beyond the tentative stage, and has become part of the settled policy of several States with results which are disappointing only to its most sanguine advocates and pessimistic opponents.

The Sacrifice of the Shannon. By W. Abert Hickman. New York: Frederick A. Stokes, \$1.50

A book that fills the mind with whistling north winds, pounding seas and tons of grinding ice should be welcome in these sultry days of summer, especially if spiced up with a piquant love story and a dash of fresh adventure. All this, with a clean cut delineation of several interesting characters, is to be found in *The Sacrifice of the Shannon*, the story of a ship that had to be given up to the deep, but not until she had gallantly crushed through four hundred miles of frozen seas to rescue another vessel, and had incidentally demonstrated to a certain sea nymph on board that the captain of the ship was a man worthy to become the captain of her fate on the voyage of life.

Rejected of Men. By Howard Pyle. New York: Harper Bros., \$1.50.

This is an attempt to introduce Christ into modern life and to show how he would be received by the men and women of our day. In order to succeed at such an undertaking the author must not only understand the unique character of Christ and comprehend fully the spiritual conditions and consciousness of this age, but he must be able to dramatize adequate situations and create types that truly represent the profound and complex mood of the modern mind. Apparently Mr. Pyle is not equipped for his task, and his book is but a contribution to the ever-growing heap of literary rubbish on this subject. The characters put forth to represent the modern world are commonplace, unintellectual and vulgar. The Christ himself is a shadow surrounded by a mob, and that genius which consists in bringing about dramatic and moving situations is altogether wanting.

Literary Notes

A REPRINT in pamphlet form of Mr. Henry's excellent translation of Pope Leo the Thirteenth's "Poems, Charades and Inscriptions," is timely, and will, no doubt, be widely read. (The Dolphin Press, Philadelphia; 50 cents net.)

....A book bearing the rather gruesome title of "Famous Assassinations," is announced for publication by A. C. McClurg & Co. In the book will be grouped some thirty of the most significant political assassinations in the world's history. The series begins with the murder of Phillip of Macedon in 336 B. C., and ends with the assassination of McKinley in 1901.

....Whatever else may be said of Lillian Bell, there can be no question of her industry. Recent indication of this lies in the announcement of her Denver story, entitled "The Interference of Patricia," which has lately been issued: Miss Bell has succeeded in acquiring a reputation as a teller of clever stories, which will doubtless be extended by this last book of hers. (L. C. Page & Co.)

....A new nature book, entitled "Along Four Footed Trails," by Miss Ruth Ann Cook, formerly assistant in Nature Work at the Brooklyn Children's Museum, will appear in the early fall. It is a readable and accurate account of certain Western animals. The jack rabbit, prong horn, prairie dog, buffalo and wild ponies of the plains are among those described. The book is illustrated by Miss Mabel Williamson. (James Pott & Co.)

....The unbroken forests of upper Maine furnish the environment for the forthcoming novel by Charles Clark Munn. The author introduces as a theme the joy of woods and waters, and has made camp life and wood lore incidental. It is said to be a genuine old fashioned love story of the kind that the public never tires of reading. The book will be ready about September 1st, and will be illustrated by A. B. Shute (Lee and Shepard).

....One of the most recent publications issued through Albert Brandt (Trenton, N. J.) is "The Gate Beautiful, Being Principles and Methods in Vital Art Education," by Prof. John Ward Stimson, formerly director of art education at the New York Metropolitan Museum of Art. The first half of the work treats of the philosophy of beauty. The second half is concerned with the classifying, arranging and illustrating of the consecutive steps of study, and development by which any earnest student or teacher may help himself, or others, onward in a vital and living art career.

Pebbles

"DID you see that a tribe of Arabian fanatics were wiped out of existence by a desert windstorm?" "What a sandy finish of a tough race!"—*Yale Record*.

....*Scribbler*: "Would you call yourself a poet or simply a versifier?" *Scrawler*: "Well, when the editor lights his pipe with my stuff it's a case of verse afire."—*The Bookman*.

...."It is unwomanly!" The New Woman laughed in derision. "It is immodest!" The New Woman shrugged her shoulders disdainfully. "It is unparliamentary!" The New Woman started, paled and drew back.—*Puck*.

...."The flowers along your garden fence seem to grow better than any of the others," remarked the visitor. "Yes," explained the host. "That's where we have always buried the neighbors' cats."—*Chicago Tribune*.

...."The president of a Southern college is to be put in the Hall of Fame." "What's he done remarkable?" "Why he spoke two hours the other night and didn't once mention the negro problem."—*New York Times*.

....*First Rabbit*: "Well, my wife and I are up against it." *Second Rabbit*: "What's the matter?" "Why, we've only been married eight months, and we ran completely out of names for the children."—*Life*.

...."There is gladness in her gladness when she's glad, and there is sadness in her sadness when she's sad; but the gladness of her gladness and the sadness of her sadness are as nothing to her madness when she's mad."—*What to Eat*.

She had fifteen million dollars,
Placed in bonds, and shares, and rents;
He had fifteen million dollars,
So they merged their sentiments.
Now they've raised a son who's valued
At exactly thirty cents.

—*Chicago Tribune*.

....DIAMONDS.—Eight (8) American women wore five (5) million dollars' worth of diamonds at a recent ball in London. There are women with diamonds who haven't the crust to wear them. There are women with crust who haven't the diamonds. The coincidence of the crust and the diamonds is certainly *recherché*, if not actually fierce.—*Life*.

....Thus to receive only seventeen tons of presents, and worth a scant million, would have crushed any ordinary bride of her station. But Gwendolyn laughed buoyantly. "It's because of the car famine," she argued, with fine courage. "The rest will be along presently." Dear girl! How was our natural pity lost in our admiration!—*Life*.

EDITORIALS

The New Pope

THE Roman Catholic Church is the largest fraction of Christendom. That Church, in its wider interests, is so completely a monarchy, or what would be called ecclesiastically a theocracy, which is the same thing in the claim of divine right, that the election of a new Pope to rule that Church is a matter of immense importance. There is no truly catholic Church this side of Heaven; but the largest of all the fractions of the Church Universal must be the leading representative of Christianity to the world, and its development and history are of the deepest interest to all who bear the Christian name.

There are two great movements in human history by its relation to which the policy of the new Pope will be judged. One of these is the trend for popular government, and the other is the pressure for the rule of reason in matters religious as well as secular, social and scientific. Can the new Pope understand these movements? Can the Catholic Church, under his autocracy, adapt itself to these irresistible currents, or must it stand, a stubborn *non possum*, in its futile attempt to obstruct the celestial forces?

We know what Pius IX was, a heady, willful old man, whose definition, by the Vatican Council, of Papal Infallibility, and whose comprehensive catalog of the "errors" of the age, did more to discredit and palsy his Church than a century can repair. We know also what Leo XIII was, a truly pious and wise old man, whose sagacity and far-seeing prudence and whose sympathy with his age did as much as a quarter century could allow to undo the injury of his predecessor. But we do not know yet what Pope Pius X is or what he is likely to do. We know only good of him; but that good is in the line of personal character and local administration; and what he may be as a statesman, and what may be his attitude toward the progressive thought and learning of the world, we know not. It is very much to know that

he is not taken with the pomps and gauds which would make of the Pope a living idol to be worshiped. He appears to be the sort of man who would want to kick the lips that would kiss his toe, the kind of a man whom Dr. McGlynn wanted to see, who would walk down Broadway in a frock coat and a silk hat; and so far the prospect is bright.

But personal character and simplicity of life do not assure a progressive or even intelligent administration. A barefooted friar may be the most tyrannous of foolish rulers. A new Pope may be sensible enough and willful enough to reduce the etiquette of the Vatican court and abolish his imposing military guard, and yet may hate popular government. The fact that he prefers to walk rather than to ride in a sedan chair has no immediate relation to his views on biblical criticism. He may yet hold that on no subject can the Church make any compromise with the new century. He may yet be a firm believer in the fulminations of his second predecessor's "Syllabus of Errors."

We here are concerned with the new Pope's attitude toward what interests the American Church. There is such a thing as "Americanism." It means liberty and reason. It means alignment, in methods more than doctrine, with the spirit of the age. It means, in doctrine, the changing of emphasis, so as to give much more importance to the essential and spiritual, and considerably less importance to the formal. It means the relegation to the rear of the superstitious element in Church life, which is the inevitable concomitant of ignorance, but which must be left behind if the Church is to retain the confidence of intelligent men. It is its "Americanism," in the true sense, which makes the Catholic Church of the United States the most loyal, most active and most progressive branch of the Roman communion. That comes out of our popular government, our free schools, and especially our complete independence of Church and State. We do not, we cannot, know; but we have a large expectation that Pius X, despite

the name he chose, will have the sense to allow and approve the prosperous progress of the Church in this country. His quick approval of the Catholic University at Washington gives us hope.

But we cannot expect American affairs to dominate the thought of the new Pope and his advisers. To an untraveled Italian or German or Frenchman America seems very far off. But France is close to Italy, and the attitude of the new Pope toward France will be of the chief interest. The French Government is in the midst of a bitter quarrel, not so much with the Vatican as with the French Church. This quarrel is less ecclesiastical than political. France is a Republic, and the French Church hates the Republic, and does its best to overthrow it. It is as traitorous as the Army, whose officers, by an overwhelming majority, would be glad of the chance, could a leader appear, to be traitors and place a king or emperor in the seat of the President. Leo did his best to teach the French Church loyalty to the Republic, but he succeeded badly, and now the Church is suffering for its fatuity. Two French cardinals are said to have refused to vote for Sarto, and to have returned to France without waiting for his consecration. What this indicates is not quite clear; we hope it means that Pius X may be expected to maintain the policy toward France of his predecessor.

But even more important will be the attitude of the new Pope toward present day scholarship and theological progress. We know that the Catholic Church is *semper eadem*; but that is only a paper changelessness. The Church of to-day is not the Church of the Inquisition. It would to-day re-establish no Inquisition if it could, nor would it strike medals in honor of Saint Bartholomew's Massacre. An internal change can go on with no formal announcement. A fruit can either ripen or rot under an unchanged skin. Leo XIII opened the way for possible liberty of views on the most important subjects by his appointment of a commission to investigate the problems of biblical criticism. If Pius X can allow freedom of investigation, such freedom as scholarship demands and will have, then we may hope that the Roman Catholic Church will recall the sympathy of its best scholars who are now in fear

for their own honesty, or who are being forced out of its bounds; and here we refer to France and Germany and Austria—yes, and Italy itself, more than to America; for the Catholic Church in America has, as yet, outside of a single sad case in Indiana, made very little attempt to harmonize science and religion.

A single further aspect of the new election may be referred to. The Emperor of Austria is said to have put his veto on the election of Rampolla, who was the leading candidate. The result of that veto was unexpected; it was the election of the Patriarch of Venice. Now, of all places in Italy, Venice is most hostile to Austria, and possibly Sarto, the idol of the Venetians, sympathized with that feeling. At any rate there is some evidence that he is less hostile to the Quirinal than have been his predecessors. There must be found some practical reconciliation; for Quirinal and Vatican, Pope and King, must both stay in Rome. The Church must yield, whether she says so or not. She may vow never to consent, but she must consent. It will be vastly better for both authorities. The voluntary imprisonment of the Pope is already a farce, almost a screaming farce. It would be a glorious moral victory for the new Pope if he could break the self-imposed bars and chains, and be as free of all Rome and all Italy and all the world as are the bishops under him, or as is Victor Emanuel. But that fiction is, we presume, too strenuous to be given up; it may possibly be thought too fruitful of sympathetic Peter's Pence. It takes some courage and much statesmanship and wisdom to follow the stars. Old institutions will fear lest they are hitching their wagon to a comet.

The Transmutation of the Elements.

It has now been proved by Professor Ramsay that the gas given off by radium salts is helium.

Those who have followed the reports which we have published from time to time on the recent rapid progress in this department of science will recognize the great importance of this discovery and the extent of the field which it opens up for speculation and experimentation.

The two great discoveries of the past decade, the isolation of a series of inert gases, of which argon and helium are the best known, and the production of new forms of radiation, other than light and heat, of which the Röntgen rays were the first to attract public attention, are thus shown to be most intimately related to each other, altho no one suspected any connection between them when the discoveries were first made. In radio-active matter we are apparently witnessing a transmutation of the elements of which helium is one of the products and the Röntgen rays one of the effects.

In work so recent, involving methods of detecting matter thousands of times more delicate than the balance or the spectroscope and where the deductions are so startling, we must beware of accepting as proved the first explanation which is offered; but even tho the conclusions are tentative, the intelligent reader realizes that, however little time or inclination he may have for science, he must not remain entirely ignorant of the revolutionary changes now taking place in chemistry and physics.

What seems to be happening in radio-active matter is the breaking up of the atoms. All such substances have very high atomic weights, thorium and uranium being the heaviest atoms known. The atomic weight of radium was determined by Madame Curie to be 225, but may be 258. It was discovered by Professor Rutherford, of Montreal, that a very light gas was given off continuously by active salts, a gas of which the atoms weighed only about one per cent. of the atoms from which apparently they came. This gas is now known to be helium, an inert gas only twice as heavy as hydrogen, detected first in the sun by the spectroscope and found afterward on the earth in some uranium minerals. It seems, then, that these small atoms of helium are chips knocked off of the large atoms of radium. They are charged with positive electricity when emitted and are thrown off from the radium atom with a velocity of some twenty thousand miles a second, causing heat or phosphorescence in whatever they strike. They have little penetrative power, however, and are stopped even by paper.

At the same time that the atom of

radium projects the helium atoms it also throws out, with a velocity approaching that of light, electrons or corpuscles charged with negative electricity and a thousand times smaller than the hydrogen atom. There must be about 200,000 of these in a radium atom, yet their size relative to the size of the atom is like that of a grain of dust compared with the room it is in. These electrons, on account of their small size and great speed, can pass through ordinary matter; even a plate of iron or lead an inch thick is somewhat transparent to them, and when they strike the flesh serious burns are produced.

The perplexing question now arises, what is left after the radium atom has split off helium? The residual substance is, of course, in almost unimaginable minute quantity, a few atoms among many millions yet undecomposed; still it can be detected, for it is radio-active—that is, projecting electrons which can affect a photographic plate and make the air a conductor to electricity. It seems to be a heavy gas, since it diffuses slowly through tubes, but is stopped in passing through a tube cooled to 250° F. below zero, probably because it is liquefied at that temperature. It loses its radiating power after a time and so becomes incapable of detection. Possibly it consists of a series of other known or unknown elements, and, if so, we may guess that all the other elements were produced by some similar process of breaking up of elements of high atomic weight, such as thorium, uranium and radium.

If this is true, atoms are not the indestructible units we have thought them, but are stable only as, for example, the solar system is stable, undergoing no considerable change for thousands or millions of years, yet at times decomposing and recomposing with great rapidity and violence. Radio-active substance, then, may differ from others only in having an appreciable number of atoms in a state of unstable equilibrium, falling into new and more stable combinations. This decomposition of an atom and ejection of charged particles goes on regardless of the temperature. Radium compounds are active through an astonishing range of temperature, from that of red heat to that of liquid

hydrogen—that is, nearly to absolute zero.

Evidently speculations based on these new discoveries will encourage those who are trying to make gold out of lead or silver, and already we see by the newspapers that there is a revival of alchemy. Really, of course, the practical transmutation of metals is as visionary as ever, and the search for the philosopher's stone is a vain one. There never has been known any reason why lead could not be transmuted into gold, except that no one could do it. The alchemists were justified in trying all possible reactions to accomplish it. The fault of these medieval chemists was not in their aim, but in their motives. They wanted to get rich. Chemistry lost five hundred years of valuable time because chemists sought for gold instead of truth. As soon as men abandoned their purely mercenary motives and began to search for knowledge, not for any practical value which could come from it, but because they loved it for its own sake, then the material rewards began to flow in upon them, until now in every country thousands of chemical manufactures contribute more wealth to the people than if the dreams of the alchemists had come true and gold could be made from baser metals.

The Psychology of the Race Question

To thoughtful Northern men, whose sympathies and convictions compel them to accept a social recognition of the negro, no less than an impartial observance of his political rights, the persistent opposition of Southern whites seems unaccountable. The white men of the South are supposedly endowed with reason, and the weight of argument seems to be on the side of Northern views.

Political sense is unequally distributed in each race. Thousands of white men vote at every election who have no more comprehension of the issues that they are helping to decide than so many automata might have. Thousands of negroes can be found who know our political history, and who understand well the merits of current political controversies. Admitting that voting by ignorant men,

black or white, is undesirable, why should any line of exclusion be drawn between one-half of the intelligent and the other half because one-half is black skin and the other white?

Agreeable social intercourse is possible only among those who have cultivated manners and intelligence, and who, in taste, sympathies and interests, are congenial. There are negroes who have all the cultivation of educated whites. Why are they unfit to mingle on social occasions with the so-called superior race?

From the standpoint of reason arguments like these are hard to meet: and to those who habitually look at all social questions in a rational way the Southern temper looks like blind prejudice.

The other day the Rev. H. H. Proctor, pastor of a colored Congregational church in Atlanta, and one of the ablest negroes in the South, wrote an admirable letter to the *News* of that city, denying that the race question is fundamentally one of color, and saying that he had too high an opinion of the white race to believe that, "no matter what changes may take place in the negro, his color will forever debar him from receiving from the white the full expectations of a man." To this remark the *News* frankly replied that color, mere color, must forever remain a bar to negro aspirations, until the blacks withdraw from the Southern States and establish a nation of their own on the African continent. In support of this averment, the *News* offered no facts or reasons other than the existence of an undying prejudice. Whether intended or not, its article was an open confession that the Southern view is a fact of feeling rather than of reasoned conclusions.

More frank confessions of this kind would do good. They would help the North to understand the South, and the South would better understand the North if it could more fully realize that the Northern view, while not devoid of feeling, is largely a product of intelligent reasoning.

In saying this we do not mean to be invidious. Feeling is as large a part of life as reason is, and it has its own justification. Feeling is essentially conservative. It is associated with familiar interests, which it cherishes and defends. Reason is progressive, and on that ac-

count it is innovating and disturbing. If the race problem is to be solved there must be a sincere desire to learn whether Southern prejudice has a legitimate basis in vital interests that must not recklessly be jeopardized, and an equally sincere desire to accept as far as possible the reasoned out idealism of the North. This may be compromise, but it is the kind of compromise that involves no moral turpitude, and is vital to the public welfare.

No white man can be long in the South and on friendly social terms with its influential families without discovering that the most intense feeling against admitting the negro to social equality is found among the white women, and that it is inseparable from the instinct of race-purity. To a pure-minded woman her conduct and the blood of her race are one. She can no more think of her honor apart from the traditions of her ancestry, and the ideal of an unsullied posterity, than she can think of family integrity apart from her honor. To take from her the ideal of purity of blood is to cut off the very springs of her moral life. Through generations of social experience she has learned that the only effective barriers to intermarriage are those established in the usages and conventionalities of society. Families, classes, nationalities and races that mingle freely in social intercourse on terms of recognized equality are bound to intermarry—no power on earth can prevent it. Here is the very fountain head of the Southern determination to resist the social equality of the races to the uttermost. The Southern white woman regards intermarriage with horror, and she believes that social equality means inevitable intermarriage.

Feeling so intense as this will not readily be displaced by reason.

The hope of the negro lies in the growth of feelings of another sort; feelings of humanity, which will more and more insist that whether or not the black man be invited to sit at the white man's table, he shall at least be given opportunities to improve his economic condition and to acquire knowledge, and that he shall have full protection in the enjoyment of all his civil rights. These feelings are bound to grow. Whatever

may be true of other feelings, these at least are consistent with the conclusions of abstract reason. The part of wisdom is to make the fight for negro betterment on issues in which feeling and reason are at one. We have no interest in the question of social equality. That is to be granted or refused on personal grounds at each person's arbitrary and unquestioned will. What we ought to agree on, North and South, is equality of political and civil rights.

Love-Making in the Parks

THIS is the season of the year when the newspapers usually devote some portion of their valuable space to the consideration of this topic. It cannot be said, however, that the results of the discussion are altogether commensurate with the extent and fervor of the editorials and letters, for these either fail to show a philosophic grasp of fundamental principles necessary in dealing with this subject, or are marred by a levity which is altogether out of place in discussing so serious a topic. So far the Clark University psychologists have omitted this from their study of adolescent phenomena.

The subject can be best considered under two heads; first, why do people want to make love in the parks; second, why do other people object to it.

The most obvious reason why young people betake themselves to the parks for love-making is that there is no other suitable place where this most important duty of their lives can be performed. Of course, some lovers do use fire escapes or front steps, but only at great inconvenience to themselves and annoyance to other people. It is not merely the inhabitants of the tenements who are so unfortunately situated, but a large proportion of the population of the city. Even the apartments which boast all the modern conveniences have no room for match-making, and flats seem to be contrived, not so much for men as for angels, among whom there is no marrying. Besides, no house is a proper place for the purpose. So elemental a passion cannot be full, free and genuine in a confined and artificial environment. Any one who has tried it knows how

awkward it is to make love in a conventional drawing-room. It is as difficult as to act in a rehearsal without the scenery. One feels the incongruity of the stage setting and cannot throw himself into his *rôle* with abandon. No grand passion is possible in a parlor; nothing but "Dolly Dialogs" can be enacted there. Will the reader kindly think how many great pictures he can recall representing love scenes in a modern residence? Also, please mention a few, just a few, good lyric poems on love-making in an apartment house. Even our novelists, who have little enough romantic feeling, find it almost impossible to pull off a proposal indoors, but take to the woods, the fields and the garden for the purpose, altho a conservatory with a musical accompaniment will do in an emergency.

The reason why "in the spring a young man's fancy lightly turns to thoughts of love" is because then he gets out of doors. If he remained always cooped up as he is in the winter, probably his fancy would never turn in that direction, for thoughts of love, even light ones, require a larger proportion of oxygen than is found in our city houses. The first love-making of our race was done in a park, and the sons and daughters of Adam and Eve instinctively select the same stage setting when they play their parts in the old drama. We can see the softening effects of trees and flowers even on old and hardened married couples. As they enter the park the husband's face drops something of its harshness and suspicion, and the woman speaks less sharply to her children than she did on the trolley car.

There are doubtless other motives for the selection of the parks for the display of amatory emotions. There is the same motive that leads people to eat ice-cream in public, and, when they dine most elegantly, to have the table placed before a large window so those in the street can watch them. We are all of us naturally so unselfish that it is not enough to enjoy ourselves; we want other people to see us enjoying ourselves.

Unfortunately, this confidence, that other people like to see us happy, is not always justified, and this leads us to the second part of this discussion, why peo-

ple object to love-making in the parks. Is it altogether due to the "ne'er a ane hae I" feeling, or is there some other justification for it? Most of the reasons given for objecting to the custom are manifestly false. There is first to be considered as most often heard the complaint that it "looks silly." Now, in order to form a valid ground for objection the implicit major premise must first be proved—*i.e.*, that people dislike to see other people acting in a silly manner. This is by no means axiomatic. In fact, if we consider the popularity of vaudeville performances and the high prices paid for orchestra chairs at other exhibitions of an undignified character, we shall question it. The minor premise, that the young people in this peculiar situation look silly, may also be challenged. Not all of them are handsome or graceful, it is true, but this much may be said, that at this period of their lives they are roused out of the dull commonplace of their daily lives, and their faces become for the moment so transfigured by the love that glows within as to lose something of the sordid or brutal expression which under ordinary circumstances they may bear. This is the one fleeting phase of their lives which painters and poets delight to make permanent in color or in verse. As the maiden looks into her lover's eyes her face transforms itself almost into the ideal she sees imaged there, and she becomes for the moment nearly as beautiful as he thinks she is. Love is a creative power and models out of common clay a goddess worthy of its worship. Millet has shown us the beauty of the coarsest peasant face when so illumined. How much better than to look at Millet's pictures it is to look with Millet's eyes.

It must be acknowledged in candor that the face of the lover is not so attractively transformed. Observation shows that the gentlemen under these circumstances tend to assume one of two types of expression; either he looks woodenly unconscious, like one who knoweth not what his right hand doeth, or his face takes on a set and determined look like that of a diver plunging into the surf. But it does not "look silly." Quite the contrary. The major and minor premise of this proposition being so unsubstan-

tial, a Scotch verdict of not proven must be rendered on the conclusion.

The other criticism, frequently expressed, that such scenes are "shocking," is quite as fallacious, for it depends on the *à priori* assumption that city people can be shocked, and, even if this be taken for granted, it must then be proved that a few park couples furnish sufficient voltage to shock them.

The question of whether love-making is out of place in the parks demands more serious consideration. We have already shown that the parks form a suitable *mise en scène* for lovers; it remains now to consider the subject from the standpoint of the Park Commissioners and see whether lovers form appropriate decorations for the parks. This depends on the style of the landscape architecture, whether, for example, it belongs to the period of Louis or Loubet; for what would be appropriate to *le grand monarque* would naturally be out of place under the *régime* of *le petit bourgeois*, and *vice versa*. In the days when artists painted good landscapes a pair of lovers near the prompt entrance was regarded as a necessary detail to give human interest to the picture. Our modern artists do not seem to care so much about human interest as about color tones, and both our landscape artists and architects have been much influenced by Oriental ideas. Now, in a Japanese landscape an amatory scene in the foreground is incongruous, for the Japanese never kiss, and the decorations which go with this style are a fisherman with a cart-wheel hat over his face and birds exploding in mid-air. In the formal garden, surrounded by trees clipped conically, and in front of a pillar capped by a stone urn with nothing in it, a Bowerv boy and his "steady" look quite out of place, and a notice should be put up forbidding lovers to pose there except in fancy dress of the Watteau fashion. But in those parts of the park which are more truly rural a person of nicely cultivated taste would feel it a violation of the unities if shag-bark bridges, picnic parties and lovers were left out of the scene. Indeed, if there were no volunteers, it would be necessary for the Commissioners to do what they have been compelled to do in Europe—that is,

place groups of lovers in marble or bronze in cozy nooks.

Nature adopts the lovers as her own. The leaves fall on their heads and are not shaken off; the squirrels play on their shoulders undisturbed. They do not frighten even the little bird who hops at their feet, and, seeing on the asphalt a twig or a feather, is seized with the idea that it is out of place, and in a casual manner carries it to the fork of a neighboring tree. Dear little nesting birds, we would not put a straw in their way—unless, of course, we thought they needed it.

The love-making which goes on in the parks is not that of which a city has need to be ashamed. Its publicity is its protection. Where the daughter of the rich has one chaperone, the daughter of the poor has a thousand. Vows made by the inconstant moon or the more reliable electric arc afford no more amusement to Jove than those made by gas light.

Matches made in the office or the drawing-room are apt to have too much of the fiscal or the fashionable about them. Love does not thrive in the city. In its true sense and most vivid form it is a country product. With the closing of the parks to the lovers would come a decline in the art of love-making, and with this would decay literature, painting and music; for these arts have been proved to be amatorial in their origin.

America and Macedonia

THE United States is deeply interested in the troubles and attempted revolutions that perplex the Porte. We have a vital interest in Turkey, because so many of our countrymen are there, engaged in their legitimate business as teachers of science and religion, an interest much larger, as our Department of State knows, whether our Minister at Constantinople knows it or not, than any commercial interests of ours in the Sultan's dominions. The present outbreak in Macedonia and the threatened troubles in the Armenian districts again call our attention to the demands which our Government has made on Turkey.

Of those demands, presented to the President by our American residents in

Turkey, one has been granted fully—that is, the permission for medical graduates of the Syrian Protestant College at Beirût to be examined and licensed to practice medicine. An examination has just been held and certificates granted.

But the main request was for just the same general authorization and privileges to be granted to American schools as are granted to British, French, German and Russian institutions. This is still refused. Instead of freedom for schools, Minister Leishman secured freedom for—pork! America is still discriminated against in comparison with other countries. There was given to the Porte, we presume at its request, a list of American schools, and immediately telegrams were sent to the governors asking reports; and apparently an effort is being made to connect the schools with revolutionary intrigues. A leading Armenian professor in the college at Harpût has been arrested and imprisoned, altho quite innocent of any treasonable act. We trust our Government will not fail to require Mr. Leishman to present a more imperative demand for equal rights for Americans in Turkey.

But meanwhile a new revolution is being attempted, with better hope of success, in Macedonia. Of course, the revolutionists cannot expect to succeed by their own unaided efforts. What is Macedonia or what is any one of the Balkan States but a conglomeration of hostile religious nationalities, utterly without a common hope or purpose? In Macedonia there is here a Bulgarian village, over against a Greek and a Mohammedan village; or a single village has its separate quarters for separate populations mutually hostile. All that these Bulgarians can hope is by their own atrocities to stir up the Mohammedans to equal atrocities, until Europe in horror shall step in and assume control. It is a shocking policy, the same that failed in the threatened Armenian uprising. But Macedonia is nearer Europe, in reach of the Austrian and Russian armies, and it might succeed this time. What works against it is the fact that both Russia and Austria desire no revolution; and, further, that the Turkish army, with its overwhelming force, is officered by Germans, who know their business and un-

derstand the rules of civilized warfare. If the revengeful Albanians can be kept out of the field, there is good reason to expect that the revolutionists will be easily crushed, and fair reason to hope that the promises of better government will, under foreign pressure, be measurably kept—by and by.

But if the Albanians cannot be kept out, and if it should be necessary for Austria and Russia to intervene, there may be such a readjustment of the map of Turkey as will startle the world. But for the fact that all the energy of Russia is now directed toward the extension of her Chinese frontier, we should fear that the time had nearly come when Russia would make a second attempt, this time successful, to take possession of Constantinople as her southern capital, allowing Salonika to Austria, with a little sop of land to Italy. But that, we presume, must wait two or three decades longer.

Mr. Vardaman So Editor Vardaman seems to be slated for the next Governor of Mississippi, and that, too, in succession to Governor Longino, too true a man to succeed himself. Mr. Vardaman is editor of *The Commonwealth* in the town of Greenwood. For some years he has been seeking this nomination, which he now seems to have secured by popular vote; for in Mississippi every Democrat votes for a nominee, which is the real election, while on election day only those vote for the nominee who have paid their poll tax. During this time the main issue Mr. Vardaman has defended is the reduction of the appropriations for negro public schools, allowing them only the money from the taxes which they themselves pay. At last he seems to have converted the State to his views, altho as long as Dr. Curry lived and went about addressing State legislatures on the subject his suicidal policy found little support in Mississippi or elsewhere. In an address to the people of his State in 1902 he declared that the Fifteenth Amendment had put the South in "a diabolical predicament," and that the fathers of the Republic "considered the negro no more a citizen capable of participating in the government of the country than the wild

asses of the plains." He would have "the enormous sums of money squandered every year on the negroes in the delta" given to the white schools; because "when you educate a negro you usually make an immoral woman, hypocritical preacher or bunglesome forger." He concluded his address thus:

"I know that anything that causes the negro to aspire to rise above the plow-handle, the cook-pot—in a word, the functions of a servant—will be the worst thing on earth for the negro. God Almighty designed him for a menial; he is fit for nothing else; and I am one of those who think it futile to oppose, or try to improve upon, the plans of Omnisience."

And this he was bold to say without regard for "a lot of short-haired, open-mouthed, South-hating termagants of Boston."

General Miles

We are sincerely disappointed that the retirement of Lieutenant-General Miles was accompanied by no word of appreciation for his military services, such as the President and the Secretary of War might fitly have spoken. We understand what a thorn he has been in their side of late, and we have some idea of the spectacular side of his nature; but he did admirable service in the Civil War, and was a brilliant Indian fighter, however unwise he may have been in his relation to the Spanish War. But he has doubtless been as honest as he has been mistaken, and has shown not a little moral courage, even with little judgment. We wish that in announcing his retirement for age there had been a generous recognition of what he has done, such as might have been not merely a balm to his spirit, something for him to recall with pleasure, but something also to gratify and satisfy the public, which has not forgotten his brilliant services in the past before he was forbidden to take the part his rank entitled him to in our war with Spain.

Thieves in a Panic

The relentless prosecution of corrupt legislators in Missouri by Mr. Folk has been marked by many curious incidents and frequent indications of profound

mental disturbance on the part of the accused men. In the record of this persistent and highly successful pursuit of the guilty there has been nothing more remarkable or ridiculous than the performances of one D. J. Kelley, for some months past an exile in Canada, who has been called in all the reports of these bribery proceedings the legislative agent of the "Baking Powder Trust." Lieutenant-Governor Lee, a wretched man who confessed his guilt and gave up his high office, had many dealings with Kelley, against whom he testified before the Grand Jury. Kelley then became a resident of Canada. There he permitted his resentment to get the better of his discretion. He set out to ruin Lee, not realizing that he could add nothing to the weight of Lee's own admissions, which had wrecked the life of the former Lieutenant-Governor and made him an object of contempt or pity. From his place of refuge near the boundary he has been sending to St. Louis copies of the incriminating letters and telegrams that passed between Lee and himself. Reporters from St. Louis have visited him and borne away for publication the evidence of his dealings with Lee. Last week the man even sent his wife to Missouri, bearing the original papers, in order that she might lay them before the Grand Jury. All this has been done by the exile to prove that Lee has been a rascal, which Lee himself long ago admitted. Kelley does not seem to understand that at the same time he is furnishing evidence for his own conviction. This shows to what absurdities a man may be led who has no sense of humor. If Kelley has no thought for his own reputation, one would suppose that regard for his principals would at least keep him quiet. His acts can be explained only upon the theory that he has become subject to the irresistible influence which appears to have been exerted by Mr. Folk upon all who were discredibly involved in the corrupt acts that have been the subject of his inquiry. It is the legitimate influence of an honest, competent, impartial and indefatigable prosecutor, whose persistence has driven the guilty to confession, dissension, and all the wild acts which it is possible for a panic-stricken band of thieves to commit.

Utah Not a Model State

A few weeks ago we made note of the report of the Grand Jury in Salt Lake that it "has not been able to secure evidence that a single case of polygamy has occurred in this district since Utah became a state," and commented in a sarcastic vein on this remarkable statement, which "certainly could not be truthfully said of any other state in the Union." Since then we have received letters from readers, who think we put too much faith in the report of the Utah jury, and who state from personal knowledge that polygamy is still extensively practiced in the State. One friend writes: "I know of one hundred and seventeen polygamous families, and the heads of families still living that life and having children born to them every year," and offers to show us around so we can see for ourselves. We accept this kind invitation, and, whenever we visit Utah again, will be pleased to have him introduce us into polygamous society.

**Training Teachers**

The Nebraska State Teachers' Association has touched a weakness in our school system that should have been long ago recognized and removed. In the annual report we are told that eighty per cent. of the teaching material comes from the high schools. "Yet the chief object of the high school throughout the country remains to prepare the way for colleges and universities." It does "not exist sufficiently in and for itself." The fact is constantly ignored that ninety-five per cent. of those children that come within its radius complete their education there. It is "the only normal training school for eighty per cent. of the teachers," except in a few States that have otherwise provided. The report goes on to say that the chief problem now in our public schools is good teachers—those who have a gift for teaching, besides knowledge of school management and of the subjects taught. "This the high schools could give us if they were manned by persons prepared for the work; and were not straining every nerve under the burden of college preparatory courses of study. About seventy per cent. of high school graduates attempt to

teach; and they have as much right to demand that their district fit them for work as the one or two per cent. have to be partly or poorly fitted for college." In some of our Eastern States, where normal training is being largely taken up by the smaller colleges, there is less obligation of the high schools to devote themselves to preparatory work.

**St. Seraphim**

The enshrinement of the relics of St. Seraphim at Saraff and the official visit of the Czar to the new saint brought together a crowd of people which is reported to number—the Russians handle these large figures carelessly—300,000 or 600,000 persons. At the sight of the relics the blind were made to see, the lame to walk and many were cured of incurable diseases. Owing to the isolated situation of the monastery the food supply gave out and there was much suffering among the pilgrims. This illustrates a serious defect in the Russian character, which has often been mentioned by travelers, a certain lack of practicality, especially in matters pertaining to religion. What the saint should have done under the circumstances was to have fed the five hundred thousand. We do not wish to say anything to injure the prospects of St. Seraphim, who otherwise seems to have made a very creditable *début*, but a saint who has not a sufficiently large repertoire of miracles to give a complete change of bill on an emergency like this is not what the twentieth century has a right to expect. We hope we will not offend the saint by this criticism, which is kindly meant, but we do feel it our duty to call his attention to the desirability of cultivating this particular miracle of feeding the hungry, even if he has to neglect the blind and the lame, for we are told that in the Russian Empire there are one or ten million people—again we must acknowledge a little uncertainty in the figures—who are on the verge of starvation. If St. Seraphim could do a little something for them he would deserve to be regarded as he was by the Holy Synod, an especial favor granted by Heaven on the Czar and Russian people on account of their orthodoxy and religious zeal, referring, we assume, to the recent striking manifestation of this zeal at Kishineff.

In his public utterances Mr. Bryan has now descended to the level of the common scold. From that level, apparently forgetting that he was twice rejected by the people, he looks up to the man who was twice elected and calls him a "bunko steerer." If this attack upon Mr. Cleveland had been resented by those before whom it was made there would be more ground for hope as to the future of the Democratic party. But Mr. Bryan was addressing a great meeting of Democrats at the opening of the campaign in Ohio, and the press dispatches report no sign of disapproval in the audience. On the other hand, it is asserted that for the words including that epithet he "received his greatest ovation." Wherefore we incline to the opinion that his value as a political asset of the Republican party is not declining.

In the death of William E. Dodge New York loses a citizen of distinguished value, who well maintained the reputation and carried on the philanthropic work of his excellent father. It was not his wealth, which has been often exceeded, but the use he made of it that has given him such honor. He was not only at the head of a very large mercantile business, but was devoted to the religious interests of the country in their larger relations, looking beyond sectarian divisions. He was also a generous and intelligent supporter and director of our great Museums of Art and Natural History, and a liberal benefactor of our colleges. An example such as his breeds the most useful class of our citizens.

Senator Tillman is another national legislator who needs to be enlightened as to the prohibitions of the Interstate Commerce law. Advertisements and notices following the acquisition of his purse by a pickpocket show that it contained numerous annual passes, one of them for the Burlington system. Because they are persistently offered, he says, "he just naturally has to take them." Why, if the use of them is a violation of law? And how does his conscience permit him to accept such favors from the railroad "magnates," whom he has denounced for their dishonesty and greed?

It would be an outrage on all modern precedents and on all decency for the diplomats at Peking to consent to the giving up to the Empress of China of the two Chinese so-called "reformers," whom she wishes to execute. Doubtless they have plotted for her overthrow, but that is a political offense, and political refugees are not returned on demand. Shen Chien, the reformer who fell into the hands of the Empress, was beaten to death by her orders, without trial. That is not the kind of Government to deliver any prisoner to, much less a political prisoner.

In a speech last Sunday at Marseilles Prime Minister Combes, referring to the hostility of the Congregations and the higher clergy to the Republic, said that if the situation continued the Government would be obliged to consider the advisability of modifying the relations existing between the Church and the State. This is a second warning that the Concordat may be abolished and absolute separation decreed. The permanence of a true republic demands this policy. It is better for both Church and State, or would be after a dozen years.

The letter of President Roosevelt to Governor Durbin, of Illinois, commending his resolute stand against the lynching in Evansville, Ill., tells the truth vigorously, as the President well knows how to utter himself. He speaks the better sense and conscience of the country. "Mob violence," he says, "is simply one form of anarchy; and anarchy is the handmaiden and forerunner of tyranny." However hateful the crime, lynch law is no remedy.

It will be impossible for Mr. Chamberlain to buck against the unanimous English Board of Trade. If that has, as reported, advised against any system of colonial preference in the taxation of food products, he must yield. England is not at all weary of free trade, under which it has so prospered. But there are other ways to accomplish the end in view, such as subsidizing the ships that trade with the colonies.

FINANCIAL

The Cunard and Steamship Trust Compacts

THE agreements of the British Government with the Cunard Steamship Line and the International Mercantile Marine Company (sometimes called the Atlantic Steamship Trust) are compacts of much importance. It will be observed that the Cunard agreement was made on July 30th, and that the one with the combination formed by Mr. Morgan was signed two days later. With the Cunard Company the British Government virtually goes into partnership. It agrees to advance \$13,000,000 for the construction of two new ships, which are to have a speed of 24 to 25 knots; to pay the company \$340,000 a year for twenty years for carrying the mails, and to pay annually \$375,000 on account of each of the two new ships, in return for certain concessions. The \$13,000,000 is to be a loan at $2\frac{3}{4}$ per cent., to be repaid in twenty annual installments. It appears that in the first year of the use of the new ships the company will be paying to the Government \$1,007,500 in interest and installment, and receiving from the Government \$1,090,000. Thereafter the payments to the Government will, of course, decrease. The chief concessions for which the Government pays so liberally are these: all the ships are to be at the disposal of the Government for hire or purchase in time of war; no foreigner shall be a Director, nor shall any share of stock be held by or be under the control of a foreigner or a foreign corporation; all the officers and engineers and at least three-quarters of each crew shall be British subjects; all certificated officers and not less than one-half of each crew shall belong to the Royal Naval Reserve; the new ships are to be built in a manner providing for their use in war, and no ship having a speed of 17 knots is to be sold without the Government's consent. The mails are to be carried more speedily than at present, crossing the ocean weekly, a whole week's mail to be taken on each trip. The agreement may be regarded as in the main a business transaction. The Government pays for carrying the mails, and also for the prospective use not only of ships but also

of officers and men in time of war. Incidentally it confines its mail shipments to this line under conditions which may withhold prompt service from correspondents.

The International Mercantile Marine Company appears to have yielded substantially everything that was demanded by the British Government. The British companies must continue to be British; a majority of the Directors, the ships' officers and three-quarters of each crew must be British subjects; no British ship shall be transferred to foreign registry without the Government's consent; the British ships shall be subject to hire or purchase on the old terms; one-half the new tonnage built or acquired must have British registry, and the Government must be advised of the absorption of other lines, of whatever nationality they may be. This agreement is for twenty years, but the Government has the right to terminate it at any time, "should the company pursue a policy injurious to the interests of the British mercantile marine or of British trade." We cannot see that anything has thus far been accomplished by that sensational combination beyond the production of indigestible securities, the enrichment of White Star shareholders, greater prominence and advantage for the Cunard Company, an increase of British naval strength, and possibly also, under the agreement of August 1st, greater power for the British commercial marine.

....The Booklovers Library, of which Seymour Eaton is Librarian and John E. Bryant, Treasurer, has declared a dividend at the rate of 10 per cent. per annum for the fiscal half year, ending June 30th, payable on August 20th. Cash dividends have been paid regularly since 1900 at the rate of 10 per cent. upon the capital of \$2,600,000.

....Commerce between the United States and Russia made its highest record in the fiscal year which recently closed. The exports to Russia were \$17,606,812, and imports from that country \$9,282,396, against \$10,332,000 and \$7,342,000, respectively, in the preceding year.

(Continued on page 1948.)

INSURANCE

The Study of Insurance at the University of Illinois

WHATEVER men in other lines of business may think of the importance of getting college trained men, the insurance companies at least are showing an appreciation of their value. The work in insurance at the University of Illinois has attracted the attention of the Northwestern Mutual Life Insurance Company. Their General Agents in the Chicago district have this summer selected four of the best students who are in the "Courses of Training for Business" at that institution, and have set them at work in their offices at Chicago and Milwaukee. The officers of the company give the young men instruction in various lines of insurance work, and put them into the field, meantime paying them \$10 a week to meet their expenses. In addition, a scholarship of \$300 has been provided for the next university year. This will be available to that one of the group who shall be most successful in his summer's work. This student will then return to the University of Illinois to pursue the study of insurance in a theoretical way during the next university year. After that he will be placed with the company, should they want him.

IN "Fire Insurance and How to Build," recently issued by The Baker & Taylor Company, Francis C. Moore, ex-President of the Continental Insurance Company, has devised not only a guide to insurance agents respecting fire protection and extinction, but he has introduced special features relating to manufacturing risks, the writing of policies, adjustment of losses, as well as a deal of other information, general as well as specific. The book begins with a luminous explanation of the theory of fire insurance and its relation to the community. This is followed by an easily understood explanation of why an individual cannot insure himself or carry his own risk. The profit of the insurance business also forms an

interesting chapter subject. The importance of Fire Insurance is recognized by the author, and this has been reflected in his present book, which is the result of a quarter of a century of experience in the field. Both insurance and building have consideration in this book from many points of view, and all those interested in either subject will find in it much that will be of value to them.

....Embezzlements and defalcations for the month of June, as tabulated in the current issue of the monthly *Bulletin* of the Fidelity and Casualty Company, shows a decrease of \$17,039.00 over the total for the month of May. The June items are as follows:

Banks	\$267,512
Benevolent institutions.....	2,573
Building and loan associations.....	13,900
Court trusts.....	69,000
Federal and State.....	104,288
Firms and corporations.....	74,866
Insurance companies.....	62
Municipal	7,603
Transportation companies.....	364
Miscellaneous	55,775
Total.....	\$595,943

Financial Items continued from page 1947.)

THE War Department invites bids for \$3,000,000 of the 4 per cent. Certificates of Indebtedness of the Philippine Government, authorized by Congress and redeemable in gold at the office of the Guaranty Trust Company in this city.

....The Mexican Central Railway Company, through Ladenburg, Thalmann & Co., makes an offer of its Gold Collateral Trust Debenture Certificates to holders of its First, Second and Registered Income bonds, the rate of exchange being \$230 for \$1,000 of the Firsts, and \$140 for \$1,000 of the Registered and Seconds.

....The Trust Company of America and the North American Trust Company are to be merged under the name of the first of these institutions.

....Dividends announced:

Chicago, Great West. R'way, Preferred, \$2.50 per share, payable August 31st.

Rubber Goods Mfg. Co., Preferred, quarterly, 1¼ per cent., payable September 15th.

Union Pac. R.R. Co., Preferred, \$2.00 per share, payable October 1st.

Union Pac. R.R. Co., Common, \$2.00 per share, payable October 1st.

NEW YORK, THURSDAY, AUGUST 20, 1903

No 2855

Survey of the World

Coming Retirement of Secretary Root

It is understood that Secretary Root will place his resignation in the hands of the President before his departure, on the 22d inst., for London to attend the sessions of the Alaska Boundary Commission, of which he is a member. If the work of the Commission should detain him in London until the assembling of Congress, the President may find it expedient then to appoint his successor. If Mr. Root should consent to hold the office until the end of the year, it is understood that he will insist upon being relieved at that time. The General Staff having been organized and established, he feels that the work and projects which have occupied his mind for four years past are so far advanced toward completion that he can afford to yield to his inclination and resume the practice of law. It is expected that Governor Taft will be his successor. The Governor is unwilling to leave the Philippines, altho his return to the States is required for the preservation of his health. The Filipinos earnestly desire that he shall remain with them, being convinced that he is devoted to their interests. It is pointed out, however, that as Secretary of War he would still have the islands in charge, and that because of his service at Manila he is admirably fitted to deal with questions which for some time to come will probably be the most important of all that come before the War Department. It is expected that his successor would be Vice-Governor Luke Wright, who is said to be in thorough agreement with him as to the policy of the insular government. Politicians remark that the Democratic party, when a life-long Democrat and an ex-

Confederate soldier is governing the Philippines in accord with the Republican policy, will be at some disadvantage in supporting the so-called anti-imperialist doctrines of its platform.

The Field of Politics

Altho it has been expected that the special session of Congress would begin on November 9th, it may be called for October, because the President desires a prompt consideration of currency bills as well as action upon the Cuban treaty of reciprocity. Messrs. Aldrich, Platt, Allison and Spooner, members of a currency subcommittee of the Senate Committee on Finance, have recently been in consultation with him, but no bill has yet been prepared. As a rule, Senators and Representatives prefer not to attend a session in October because at that time they will be engaged in their State campaigns.—The first national convention delegates instructed to vote for the nomination of Mr. Roosevelt next year were elected last week at Wilkes-Barre, Pa. The resolutions say:

"We admire the courage that prompts him to do right to all men without respect to race, color or condition. We indorse his determination to hew to the line in the pursuit of offenders against the law, be they of high or low degree. We trust that he may long be spared to stand as an example of virile American manhood, fearing nothing but failure to do his duty before God and man."

—Mr. Bryan explains that he voted for Weaver in 1892 by advice of the Nebraska member of the Democratic National Committee, hoping that Cleveland's plurality in the Electoral College would be increased by a Populist victory in that State.—At an Anti-Trust mass meeting

in Washington on the 13th inst., held under the direction of the labor unions, William R. Hearst, of New York, was nominated by acclamation for the Presidency, and resolutions were adopted urging that clubs be formed to support his candidacy. Among the speakers were Representatives Shober, of New York, and Van Duzer, of Nevada.—Charles P. McClelland, a Democratic member of the State Senate in New York, will become a member of the Board of General Appraisers in the customs service, having accepted the appointment offered to him by the President. This is generally regarded as a victory for Senator Thomas C. Platt. At the recent session of the Legislature the Senate was composed of 28 Republicans and 22 Democrats, and the defection of three Republicans who opposed the rule of Mr. Platt prevented the confirmation of certain nominations believed to be in his interest. It was thought by some that Governor Odell was in sympathy with the three insurgents, and that the proceedings were a part of a contest for political supremacy between the Governor and the Senator. Mr. McClelland's acceptance of this life office, at \$7,500 a year, makes a vacancy in the Senate, and it is expected that it will be filled by the election of a Republican. In that case the three insurgents would no longer be able to prevent the confirmation of nominations made by the "organization" or to obstruct the course of partisan legislation. Democratic journals are attacking Mr. McClelland, and a Republican paper in accord with Mr. Platt regards the appointment as a defeat for the Governor.—Charles Stevenson, a member of the Socialist Town Committee in Clinton, Mass., recently became a member of the militia. The committee, holding that he could not consistently be at the same time a militiaman and an officer of the Socialist organization, called for his resignation, saying in a formal statement:

"It is the unanimous opinion of your associates on the Socialist Town Committee that your action in joining the militia is in violation of the spirit and aim of the great world-wide Socialist movement (of which the Socialist party of Clinton is an integral part), which stands for the emancipation of the race from capitalist exploitation, and in every way op-

poses the existing spirit of militarism now fostered and kept alive by the capitalist class for the sole purpose of further enslaving the workers. The present structure of government is the creation of the ruling class. That being so, the militia is part of the equipment of capitalist society."

Mr. Stevenson resigned, having decided that he would continue to be a member of the State militia.

The Canal Treaty Rejected

Dispatches dated on the 12th, from the American Minister at Bogota, were received at Washington on the afternoon of the 17th, saying that the Panama Canal treaty had been rejected in the Colombian Senate. A press dispatch of the same date asserted that this action was taken by unanimous vote.—A delayed message was received last week, saying that the Senate's Canal Committee had reported in favor of ratifying the treaty, but with "nine substantial amendments" relating to the price, territorial sovereignty, and other less important provisions of the agreement. Two members of the committee, Senators Perez y Soto and Uribe, voted against ratifying the treaty even when thus amended. By a vote of 17 to 8 the Senate had decided to discuss the question in public sessions. Other reports asserted that only seven Senators were in favor of the treaty in its present form. Among those who were in conference last week with the President at his summer home was Senator Cullom, chairman of the Committee on Foreign Relations, which has charge of treaties in the Senate. Last Saturday morning there was published in the *Herald* a report of a remarkable interview with the Senator a short time after his departure from the President's house. The amendments, if adopted, he said, will make the task of perfecting the treaty a very difficult one; "but I do not think," he added, "that we are ready to abandon Panama yet, not by any means."

"But if the United States is being held up for greater payments than it is willing to make, how can the canal be built without the treaty?"

"Well [replied the Senator], we might make another treaty, not with Colombia, but with Panama."

"But Panama is not a sovereign State, and is only a department of Colombia."

"Intimations have been made that there is great discontent on the Isthmus over the action of the Congress of the central government; and Panama might break away and set up a government which we could treat with," was the reply.

"Is the United States prepared to encourage such a schism in a South American republic?"

"No; I suppose not. But this country wants to build that canal, and build it now. It needs it for its own defence, and it is needed by the whole world. The treaty is blocked by a country that has been treated well by us, and there are very weighty considerations which make us feel that at all hazards this great work should be undertaken at the earliest possible moment."

The possibility of the secession of Panama, in company with the adjoining State of Cauca, has not been overlooked in the current discussion of the subject. It was pointed out some weeks ago by the Colombian Consul in London. A Panama newspaper was recently suppressed by the Government for advocating the independence of the isthmus.

Land Scandal in Indian Territory By the report of Samuel M. Brosius, a special agent employed by the Indian Rights Association, a scandalous condition of affairs in the Indian Territory has been disclosed, and Secretary Hitchcock has ordered a thorough investigation. Among those named in the report are the President of the Dawes Commission, Internal Revenue Collector Cobb, and United States District Attorney Soper. It is alleged that a large and very profitable business has been done in the lands allotted to Indians. Whites have induced Indians to lease their lands for five years, it is said, have refused to pay the rent or to surrender the land, and have not been compelled to surrender it. The heirs of "allottees" have been induced to sell their land at small prices, and full payment has been avoided. Title is not fully vested in such land until 25 years after the allotment grant, but the courts are said to have been complacent. Companies have been organized to deal in lands, leases, etc. Tams Bixby, of Minnesota, chairman of the Dawes Commission, is Vice-President of one corporation, the Muskogee

Title and Trust Company, and the President of another, the Canadian Valley Trust Company. Thomas B. Needles, of Illinois, a member of the Commission, is Vice-President and a Director of the International Bank and Trust Company, of which Clerk Davidson, of the United States Court, is a Director; while the company's counsel is Assistant United States District Attorney Huckleberry. The largest stockholder in another corporation engaged in the land business is Internal Revenue Collector Guy P. Cobb. United States District Attorney E. Pliny Soper is Vice-President of and a large stockholder in the Tribal Development Company. Indian Inspector J. George Wright, representing the Interior Department in the Territory, is a Director of the Muskogee Title and Trust Company. Indian Commissioner Jones, who calls for a thorough inquiry, remarks that 20,000,000 acres of land and the interests of 400,000 Indians are involved, and that "it is impossible for any Government official connected with a company dealing in Indian lands to be entirely impartial in his decisions when he is deciding questions which may affect his own welfare." Mr. Bixby says that he has never bought an acre of Indian land, and that such land has not been bought by any of the companies in which he is interested. They do a banking and loan business, he says, and are ready to loan money on Indian lands after these have been purchased. It is true, he adds, that Mr. Cobb's company is in the land business, but Mr. Cobb was not connected with it until after his retirement from the Government service.—Additional charges against Congressman Littauer have been made by T. Keck, a glove manufacturer of Johnstown, who undertakes to prove that Mr. Littauer paid him to refrain from bidding for certain contracts and that the Congressman was really the principal in many contracts held in the names of other persons.

Recent Army Changes

General Miles started for San Francisco last week to attend the annual encampment of the Grand Army. Many desired that he should be a candidate for the office of Commander, but he urged the election of General Black. When

he was asked, in Colorado, whether he would permit his name to be presented in the Democratic National Convention as that of a candidate for the Presidency, he declined to discuss the subject. The circumstances attending his retirement continue to excite comment in the press. Attention was directed last week, presumably by some one connected with the War Department, to an order issued in July, 1896, by Secretary Lamont, who quoted Army Regulation 771 of 1895, as follows:

"Orders eulogizing the conduct of living officers will not be issued except in case of gallantry in action or performance of specially hazardous services."

Friends of General Miles point out, however, that this regulation did not prevent the eulogizing of General Otis by the Department on his retirement in March, 1902, or of General Brooke when he was retired, in the following July. The report that Secretary Root desired to commend General Miles in the retirement order, but was restrained by the President, has been denied. It appears to have been suggested by the fact that the Secretary, while addressing the graduating class at West Point, in June last, turned to General Miles, complimented him in the highest terms, and urged the cadets to regard him as the ideal American soldier.—A resolution designed to express disapproval of the rapid advancement of Gen. Leonard Wood, altho his name does not appear in it, will be introduced at the encampment of the Grand Army, and copies of it have been forwarded to many officers. It does not seem to be generally known that the appointment of General Wood to be a Brigadier-General in the regular army was made by President McKinley, and that he has been brought to the head of the list of brigadiers by the promotion or retirement of others. Major-General Young having been promoted to the supreme rank, the President has sought to fill the vacancy in the group of Major-Generals by promoting Brigadier-General Wood. There are indications that the appointment will be opposed in the Senate, especially by some who think that Lieutenant-General Miles ought to have been commended. Those who defend the

promotion say that a failure to select General Wood for advancement to the higher rank would have been regarded as a slight, because he was at the head of the list of Brigadiers. On the other hand, those who oppose it say that when General Wade was Senior Brigadier, in February, 1901, General Young was advanced to the rank of Major-General over both Wade and Merriam; that, a few days later, General Chaffee was advanced over Wade; that Wade was overlooked again, when McArthur was promoted, and a fourth time, when Colonel Wheaton was made a Major-General. General Wade, a Civil War veteran, who was brevetted Brigadier-General in 1865, is now in the Philippines.

A School of Journalism

Mr. Joseph Pulitzer, proprietor of the *New York World*, has given \$2,000,000 for the establishment of a School of Journalism in connection with Columbia University. The relation of the School to the University will be like that of the other professional schools—Law, Medicine, Mines, Engineering, etc.—and there is to be erected for it in the University quadrangle on Morningside Heights, near the projected building for the Law School, a building upon which \$500,000 will be expended. Provision has been made for an Advisory Board which shall aid in devising a plan and course of instruction. Seven members of it have already been designated by the donor, as follows: President Butler, of the University (*ex officio*), Mr. Whitelaw Reid, Mr. John Hay, Secretary of State; Mr. St. Clair McKelway, Mr. Andrew D. White, Mr. Victor F. Lawson, of Chicago; Mr. Charles H. Taylor, Sr., of Boston; President Eliot, of Harvard. The last named cordially approves the plan and has given counsel to the donor, but will be prevented by his official duties from serving on the permanent board. Concerning the course of instruction President Butler says: "Thorough training in written English, in logic, in the elements of economics, in the history of the United States and in the contemporary history of Europe, will certainly be included. The more technical courses will comprise

instruction in newspaper administration, newspaper manufacture, the law and the ethics of journalism, the history of the press and related subjects." Mr. Pulitzer gives \$1,000,000 now, and at the end of three years \$1,000,000 in addition, if at that time the School is in successful operation.

Parliament After the passing of the Irish land bill by the House of Lords and the putting on the basis of law a new experiment in the solution of that eternal question, Parliament was ready to disperse. Early on Friday, the 14th, both houses met to wind up the business of the session. In the House of Commons Mr. Balfour, the Premier, in answer to an interrogation, said that the unexpected delay in the settlement of the Venezuelan question was not due to Great Britain or Germany, but to France and Spain, who objected to the use of English by The Hague Tribunal. The question had been left to the Tribunal itself to decide. As for the protests against muzzling the fiscal controversy, he thought there was no reason why that matter should be taken up hastily. There was no fiscal question before Parliament, neither should there be one during the life of the present body. In the House of Lords the King's speech proroguing Parliament was read, but caused little interest. The speech alluded to the visit of the King to France and the return visit of President Loubet to London, which was "a striking exhibition of the feelings of mutual good-will which prevail in the two countries." In referring to the King's visit to Ireland the speech declared that the King had been greatly touched by the warm expressions of welcome that had everywhere greeted him. His visit enabled him to realize "how much was being attempted to improve the housing accommodation for the working population, stimulate commercial activity, advance the methods of agriculture, develop technical education, and provide for the sick and infirm." The Irish Land bill, according to the speech, offers inducements to the landowners to continue their residence among their countrymen, and provides for improving

the conditions of life in the poorer districts of the west. After the reading of the speech Parliament was prorogued until November 2d. Many believe that there will be a dissolution in the autumn and an appeal to the country.

Hurricane Devastates Jamaica

On Monday, August 10th, the fringe of a hurricane struck the western end of Jamaica and caused some alarm. After blowing cut to sea the storm, instead of passing northwest, as was expected, veered to the south, and early in the morning of Wednesday made its full strength felt on the unfortunate island. One of the chief places to suffer was Port Antonio, on the northeast coast, which was so completely demolished that only six houses are said to have been left standing. This was the shipping port of the United Fruit Company, and had been developed into a thriving town of between two and three thousand inhabitants. The entire eastern end of the island was swept bare of crops, and the villages were literally wiped out. The farming population is left without homes and without resources. The banana plantations are destroyed and the fruit trade is ruined for a twelve-month. The western end of the island did not suffer so much, but even there the damage wrought to the various plantations was considerable. The number of persons actually killed by the hurricane is not known, but may run up beyond a hundred. The damage to property will probably not fall short of \$12,000,000. Thousands of homeless people are wandering about in a state of destitution, as even the public buildings which might have sheltered them have been demolished. A meeting held at Port Antonio appealed, with the Governor's consent, to the American people for aid. So far Jamaica is the only island that has suffered severely from the storm.

Paris News The trial of the Humbert family on the charges of gigantic forgery and swindling continues to draw large crowds to the Palais de Justice; it does, indeed, take the place of a drama for the public entertainment.

Madame Humbert wears a bold face, and the other day, during the examination of her husband, she arose and rebuked the judge for showing by his manner that he was against them. Frédéric Humbert testified in regard to the insurance concern which the Humberts had started, and declared that the operations were in good faith. He maintained that the public prejudice aroused against the family had brought about the failure of the concern by which so many poor people had lost all their savings. When the judge sought to show that Romain Durignac, who pretended to be searching for the fabulous Crawfords, had really impersonated them himself with their mysterious fortune, Madame Humbert again protested her innocence. She had tried to find the Crawfords and their millions, and could produce the Crawfords if necessary.—On the evening of August 10th a catastrophe occurred in the subway of the Parisian Metropolitan Electric Railway, which is of universal concern when one considers the number of subway lines that are being constructed in various cities. The electric motor on one of the trains passing under a crowded section of the city got out of order, and while another train was pushing it along the first train caught on fire from the damaged dynamo. The lights went out, and in the darkness the passengers attempted to find their way through the tunnel to the exits at the two nearest stations. The panic which followed was terrible, and from fire and suffocation about one hundred persons lost their lives. It was many hours before the members of the fire department and the police were able to force their way through the heat and smoke to the rescue, and the scenes as they are described were pitiful in the extreme. Assurances have been given that no such accident can possibly occur in the subway now constructing in New York City.

The Trouble in the Balkans

From the confusing and conflicting reports it may be gathered that the insurrection is still spreading and gradually approaching the Bulgarian frontier. It is centered in the vilayet

of Monastir, with magazines in the mountains, from which the peasants, who have now finished the harvest, are being supplied with arms. It appears that Krushevo was not captured until about August 14th after a bombardment and two assaults by four thousand Turkish troops. The whole Christian population of the town are said to have been massacred when it was retaken. The Bulgarian bands of insurgents continue to devastate the country, inciting the people to revolt, and in revenge the Turkish soldiers burn villages and crops. Fifteen villages are reported as completely destroyed and the inhabitants killed, dispersed or imprisoned. Prime Minister Balfour stated in the House of Commons that the balance of criminality was more with the revolutionists than with the Turkish soldiers. The Bulgarian Government, which claims to be making every possible effort to keep its people from active participation in the insurrection, has presented a memorandum to the Powers giving details of numerous cases of murder, torture, incendiarism, pillage and general oppression committed by the Ottoman soldiers and officials during the last three months, in which the Turkish Government has been supposed to be carrying out its promised policy of reform. The memorandum includes particulars of 131 outrages by Turkish authorities. During the first three weeks of July twenty-five villages in the district of Jikvesch were subjected to depredations in which the people were robbed and women assaulted. At Smerdesch over 200 Bulgarians were shot, killed with the sword or burned to death, and 300 houses, churches and schools were pillaged and set on fire by petroleum. It is claimed that 2,800 Bulgarians in Solonika, Uskub, Monastir and Adrianople, on flimsy pretexts, encouraged by the Ottoman authorities, Greek bishops and archimandrites, forced their way into the Bulgarian churches, burned their prayer books and employed menaces to compel the people to acknowledge the Patriarch. The director of the Normal School at Uskub was imprisoned because his library contained the "revolutionary" books, "Othello" and "Les Misérables."

The Trial at Monastir

The Turkish Government has apparently done everything possible to placate Russia since the murder of M. Rostkovski, the Consul at Monastir. The Sultan expressed the deepest regret and sent his son, Prince Ahmed, to the Russian Embassy with a message of apology and condolence. An indemnity of \$80,000 was offered to the family of the murdered Consul, but the widow has refused it, saying she did not want Turkish charity, and has returned the decorations bestowed on her husband and herself by the Sultan. Dr. Mandelstam, who succeeded M. Rostkovski, acted as public prosecutor in the military court which sat for four days at Monastir to examine into the affair, and the court found that Hamil, the Turkish sentry, failed to give the military salute, and when called to the carriage and reproved for it he shot the Consul several times, and afterward battered his temples with the butt end of his rifle. A lamp cleaner, who testified that the Consul struck the sentry and shot at him, was charged with perjury. Hamil and Abbas, another sentry who failed to interfere, were hanged the next day. Two lieutenants who spoke disrespectfully of the Russian Consul were dismissed from the army, the chiefs of police of the vilayet and the city of Monastir and the captain of the company to which Hamil belonged have been deprived of their commands and handed over to the judicial authorities, and the Vali of Monastir has been banished. Russia also demands the instant punishment of the officials in Salonika and Uskub, who have been persecuting and robbing the Christian population, the release of peasants wrongfully imprisoned and the immediate restoration of public order in Macedonia. A squadron of the Russian Black Sea fleet has been ordered to sail for Turkish waters to enforce these demands. Russian national feeling is being roused as it was in 1877. The Petersburg *Viedomosti* asserts it is time to expel from Europe those shameless violators who invaded a continent which did not belong to them like a pack of ferocious wolves, and who for five centuries have cruelly oppressed races of superior civilization.

A Russian Viceroyalty in the East

Hitherto the Amur district has been governed for Russia by a Governor-General controlled by the Ministers in St. Petersburg. Now a ukase, signed by the Czar and promulgated August 12th, places this district, together with Kwang-Tung Province, which embraces Port Arthur and Talien-Wan and the country surrounding them, under the command of a Viceroy, who will have supreme authority in all matters of civil administration. He will maintain order in the provinces under him, will insure safety in the country traversed by the Eastern Chinese Railway, and will in general guard the rights of Russian citizens in his own territory and the neighboring provinces. He will also take charge of all diplomatic negotiations in regard to these territories, will have command of the Russian fleet in the Pacific and of all troops in the new Viceroyalty. He is appointed by the Czar and acts independently of the St. Petersburg Ministers. His only restriction will come from a special committee, presided over by the Czar, which has been formed to see that his actions agree with the general policy of the Empire. The man designated to fill this important place is Vice-Admiral Alexieff, Aide de Camp General to the Czar, and his appointment is regarded as a triumph of M. Witte, the Finance Minister, over General Kuropatkin, the War Minister. It has been known for some time that the Russian Cabinet was in sharp disagreement over their policy in the Far East. General Kuropatkin and his partisans have desired an aggressive policy and the complete annexation of Manchuria at any cost of money or credit. To this plan M. Witte has been opposed, and the appointment of the present Viceroy, with his complete independence of the Cabinet, is looked upon as a victory for the more deliberate methods of the Finance Minister. The new policy will not affect the evacuation of Manchuria in October, but until the evacuation actually takes place viceroy Alexieff will be in command of all the troops there. Meanwhile it is reported that the Russian authorities have notified Peking that Russia prohibits foreigners for the present from Manchuria.

Russian
Opinion

In view of the activity of Russia in Manchuria and Korea a recent article in the *Viedomosti*, of St. Petersburg, is at least interesting, the more so since up to the present time that journal, and in particular its editor, Prince Ukhtomsky, has strongly upheld the "mission" of Russia in China. Now the paper declares that a review of Russian policy in the Far East for the last ten years does not reveal any results from the enormous efforts and great sacrifices made and the heavy expenses incurred. It is possible that in a more or less remote future Russia may gather the fruits of her labors, but up to the present time the harvest has been most unsatisfactory. Russia, the article goes to say, has disgusted the Chinese by her action, and in their deep distrust they have thrown themselves into the arms of their historic enemy, Japan. The Japanese have not been slow to take upon themselves the education, in the widest sense of the word, of their big neighbor, and are seeking methodically to realize under their own hegemony and for their own benefit the idea of Pan-Mongolism. The journal sees a yellow peril advancing upon Russia, not in the form of the armed Chinese warrior, but in that of a peaceful seeker after employment and profit, and a sturdy competitor in trade, manufacture and agriculture. The resourceful and insolent "Jap," who regards as his natural inheritance the whole of Eastern Asia, and who knows how to combine personal gain with national aspirations, is invading even Russian territory. How dangerous these yellow-faced missionaries of peaceful labor are is to be gathered from the fact that even America has found it necessary to exclude them by special legislation. Many other uninvited guests are putting their fingers into the Manchurian pie, which, during the cooking, Russia regarded as her own special dish. As for Korea, that country, so the *Viedomosti* avows, has in every way come under the heavy yoke of Japan, who has become its mistress to such an extent that, in spite of all protests, Japanese worthless paper money and nickel coins circulate largely in Korea; and what is still more remarkable, the Japanese have invaded Korea in such numbers that it has practically

become a Japanese colony.—Another journal, the *Kharbinski Viestnik*, which has been newly established in Harbin as the organ of the trade department of the Eastern Chinese Railway, makes the following statement:

"During the last century while our trade with European countries steadily increased, and while the exports to Asiatic countries, other than China, rose to a remarkable extent, the imports from China continue to be far in excess of the exports to that country. While our merchants here (in Harbin) in the center of Manchuria, within easy access of large Chinese trading centers, are complaining of bad trade, the Chinese merchants are doing a good business, even with such distant Russian centers as St. Petersburg, Warsaw and Riga."

Korea

Significant of the advance of Russia in Korea is the fact that the Korean Government has granted to the Russian Lumber Company a twenty years' lease of 350 acres at Yongampho, together with the privilege of buying at reasonable rates all timber rafts floated down the Yalu River by Koreans. This practically gives Russia a monopoly of the timber trade of the Yalu Valley. She has also prevented the opening of Wiju (which lies on the Korean side of the Yalu near the mouth of the river) to foreign trade. M. Pavloff, the Russian Minister to Korea, gave as his excuse for opposing such an opening three reasons: First, that the Manchurian question is not settled; second, that the opening would mean another Japanese settlement; third, that the establishment of such a port on the Korean side would involve the opening of a corresponding port on the Manchurian side of the river. In reply the Japanese Minister declares that, if Korea refuses persistently to open Wiju, Japan will regard the port as already open and act accordingly. Russia contemplates building a strategic railway line from Liao-Yang (some fifty miles south of Mukden) to the Yalu River, and, if possible, from Wiju on that river through Korea to Seoul. Some time ago the Russian *Chargé* at Seoul applied on behalf of a Russian Government agent for a concession to build this part of the road from Wiju to Seoul, but was refused on the grounds that the work had already been undertaken by the Korean Government.

Italy and America in the Balkan Question

By General Ricciotti Garibaldi

[General Ricciotti Garibaldi is the famous son of the famous father, Giuseppe Garibaldi, Italy's greatest soldier and patriot of the nineteenth century.—EDITOR.]

CALLED upon to write on a question that perhaps has not generally occupied the attention of the readers of *THE INDEPENDENT*, it is necessary for me to place before them a complete picture of the subject and the reasons that have prompted me to write on it.

When my father, General Giuseppe Garibaldi, was laid in his rough granite sarcophagus on the island of Caprera, it was generally thought that Garibaldism (as it was called), which had written so many splendid pages on many battle-fields in divers lands for liberty and justice, had died a natural death. A well-known Italian writer even stated in one of his publications that the celebrated red shirt, which had always been the uniform of the Garibaldians, was now no longer fit for anything except as a relic for museums.

But as one of our best humanitarians—lately dead—Professor Bovio, said in one of his splendid speeches, “As long as the reasons which give the impulse exist—that is, as long as liberty and justice have to be gained or defended—the type of man who wore the red shirt will always reappear.” And so it was in 1897, during the Greco-Turkish war. Of the cosmopolitan collection of volunteers that met at Athens in defense of the little kingdom against its colossal neighbor, a portion went into the Philo-Hellenic Legion, another portion served under Colonel Berthet, but the greater part placed themselves under the orders of the writer of this article. In this motley collection almost every nation was represented—“sweepings of the broom of the war-god,” as Brailsford called them—and the fact that, clad in their red shirts, they drove back from the Dranitza road the division of Hauri Pasha, brought the name of their leader into prominence, and from that time, whenever there has been a popular cause to defend, he has been the recipient of communications from all parts of the world.

A curious thing has been noted—viz.: That whereas hitherto Americans seemed to take no interest in these events from a humanitarian point of view, during these Balkan troubles a good many letters asking for information and volunteering to take part have arrived from different parts of the United States. This proves that in America there is a rapidly rising class of people who have time to consider events outside of money making, and that the great Republic is evidently leaving its chrysalis state to become a full grown and perfect unity. Probably this class will go on increasing and American interest will be largely felt in the popular affairs of other nations. Judging by the splendid example of her conduct in the Cuba question, we may be certain that this interest will always tend to exercise an influence in the direction of justice and liberty.

Before discussing what part America may take in events such as the Balkans represent—the insurrection of down-trodden populations against the tyranny of a fanatical and cruel oppressor—it will be as well for me to present the whole question from an Italian point of view.

I think we may safely divide the whole of Europe into two large sections: on one side the Anglo-Saxon, the Latin and all the smaller nationalities, comprising the Greek and also the Turkish, and on the other the German and Slavs. I need not use arguments to prove how entirely the two first amalgamate. Indeed, I have always held the idea that the English speaking race is not of Teutonic origin, but in a far greater measure Latin. If we take into consideration the centuries that the Romans held Britain, their standing army of about 60,000 men usually stationed there; the fact that many Roman families had large British possessions; that from the difference of type there was probably very extensive inter-marriage, and also the fact stated by Max Müller that in the English language 29,-

853 words are of Latin origin and only 13,230 of German—all this goes far to prove that Anglo-Saxon is a misnomer and that Brito-Latin would be far more correct.

I am a firm believer in the desire for "peace on earth," but I am also sincerely convinced that that happy state of affairs will become permanent on this globe only when the human race has disappeared from its surface. What will happen, for instance, when America has filled up her territory? It is useless to say that there are still millions and millions of acres in North America at the disposal of the settler, which, altho they really exist, certainly, for some reason, do not attract all settlers. Otherwise why do so many Americans go to occupy lands thrown open in Canada? I have seen it stated also that within ten or twenty years America will raise only sufficient meat for herself, and that this self-supporting condition will continue only for a few years, and then, instead of exporting, as at present, she will be obliged to import. It is a well known fact—and it has been noted with some apprehension among prominent thinking men in Europe—that leading meat producing firms in Chicago are quietly, but surely, buying up the cattle of South America. When the fatal moment arrives for America, as it has arrived for most other nations, when a free sphere of expansion is needed for her surplus population, where will she find it? The enormous undeveloped resources of South America would probably present a fair field for their activities. But slowly and surely South America is passing into the hands of the Teuton. The south of it is in a measure saved by the large current of Italian emigration, but still, even there, the German element is gradually taking the land.

When, a few years ago, I was there in connection with Italian emigration, I was astonished at the great activity and perfect organization of the Germans, particularly in Brazil. What struck me very forcibly was that, while the German emigrants were induced to acquire the nationality of the State they settled in, everything was done to maintain their German character and language. This curiously connected itself in my mind with the fact that every year we have a

large temporary exodus of Italian agricultural labor to Germany. My attention once aroused to these circumstances, on my return to Europe I was not long in discovering the astounding fact that the Pan-German committees and the German emigration societies were actually depriving whole provinces of Germany of the greater part of their agricultural laborers and sending them with all possible facilities to South America, ostensibly "to create a market there for German produce," but in reality to take possession of the land. Their places in the Fatherland are taken by cheap temporary labor, imported from Italy, so that when the American race turns its attention to South America, it will probably find the Germans there beforehand, and their well-known tenacity may cause a necessity for the use of the fifty warships (and probably then they will be many more) that the admirals of the United States have reviewed in American waters lately. The well organized and steady advance of Germanism into the field of the activities of other nations has created a general feeling of dissatisfaction against that people among all the civilized races of the globe, not, perhaps, so much from the fact that they are doing the best they can for themselves—that is a right which no one can deny them—as from the way they are doing it. Even in the small details of international life sooner or later the German exhibits a trait of character that at once freezes any good will that may be felt for him.

For example, lately the Kaiser visited Rome and was splendidly received by the people, for his personality is very sympathetic to the Italians. But he did one act which changed all that. It is a well-known law that no armed troops of one state shall enter the territory of another without explicit permission, which is never given save in exceptional circumstances, as it seems to imply that the local authorities are not capable of looking after the safety or welfare of their guests. When the Emperor went to visit the Pope his carriage was surrounded by armed German guards that he had brought with him, and he thus passed through Italian territory with his own armed troops. This fact did not escape the attention of the numerous foreigners who had congre-

gated for the Imperial visit, and the remarks passed on it were not pleasant to Italian ears.

I remember in 1897, during the Greco-Turkish war, all the police in Athens had been sent to support the troops in Epirus, and in the city there were only about 3,000 recruits, of such a temper that the Minister of War told me he did not dare to arm them, as they would probably sack the town. As at the time there was considerable political ferment, and as pillaging the shops had already commenced, I at once placed the 800 volunteers that I had at the Minister's disposal, offering to send armed patrols about the streets to keep order. The Minister very properly refused, saying that the dignity of the State did not allow foreigners to keep order within its boundaries.

However, it did not require Emperor William's want of tact to develop the hostility that the Italians feel for the Germans. Leaving aside the sanguinary traditions that German occupation of Italian provinces have left in the history of Italy, the pretensions of the Pan-Germans to get possession, in case of the disappearance of the Austrian empire, of Trieste and Istria, still under the House of Hapsburg, have excited a feeling of deep anger against everything German. The Austrian Empire, composed as it is of many races and peoples, has, however, up to the present been led and dominated by the German elements that enter into its composition. Against the domineering brutality of this race the Hungarians were the first to revolt, and finished by obliging the Germans to accept them as almost equal. Now all the other nationalities—Croats, Italians, Czechs, Bohemians, Poles, etc.—are agitating for something of the kind. In the midst of this confusion the Pan-Germanic committees of Berlin are steadily pushing forward their propaganda, with the aim of substituting the House of Hohenzollern for that of Hapsburg, as they openly state their intention of placing the whole of the Austrian Empire within the pale of the German one. It is said that already almost half of the Austro-Germans are won over to the new combination, and it is an open secret that the committees and representatives of this

powerful organization are to be found in almost all the towns and villages of the German provinces of Austria. But what touches the Italians especially is the fact that the Pan-Germans do not hide their intention of extending German supremacy from the North Sea to the Adriatic, thus absorbing a large Italian and an even larger Croatian population.

Now I happen to be, for the reasons stated above, in correspondence with all the centers of dissatisfaction in the Balkan peninsula, and at different times have had interviews with leading men representing the different aspirations of the populations under Turkish rule. What I can emphatically state is that *without exception they all prefer to remain under Turkey rather than fall into the hands of the Austrians or Germans.* Given such a state of things, it is easy to understand the attitude taken by the Italian popular sympathies in this question. The program of the centers of insurrection in the Balkans—that autonomy should be obtained from the Sublime Porte for these populations, *but that always the integrity of the Turkish Empire* should be maintained as the only way of preventing the much more feared occupation by Austria and Russia—has been fully accepted by all the Italian popular organizations, especially for the last reason. The appearance of Germany on the Adriatic would be a death blow to Italian supremacy in that almost inland sea, and would also place us in direct contact with the most uncomfortable of neighbors.

But the reader will, perhaps, now ask what has America to do with all this? I have endeavored to show how the ferocious aggressiveness of the Teuton is preparing difficulties for the American race in spheres of activity that are peculiarly its own, and now I suggest that since in America there is a rising desire to take part in the Balkan questions, this should take the form of helping these unfortunate small nationalities in carrying out their program for obtaining greater liberty and justice, and in helping them in their endeavor to avoid falling into the rapacious claws of Austria.

I should like to add a few more words from another point of view. Italian unity was mainly obtained with the warm

sympathy demonstrated by the British nation, both as a Government and as a people. The unwavering faithfulness of the Italians to the English has been in several trying moments of great help even to this powerful empire. As nations, however great, cannot live by egotism alone, would it not be as well for

America to create a center of affection and gratitude in Europe, as the opportunity offers itself in the Balkan peninsula, as the English did in the Italian one, helping all these small nationalities to realize their programs of liberty and justice?

ROME, ITALY.

The Minister Who is Wanted

By William De Witt Hyde, D.D., LL.D.

PRESIDENT OF BOWDOIN COLLEGE

THE other day I received this letter, which is so typical that I shall take it as my text:

"MY DEAR PRESIDENT HYDE:

"The situation is this: We have a strong parish and a weak church. The parish contains admirable material which will not under present conditions come into the church. There are many men, young and middle aged, intelligent and independent, who will not be coerced into Christian Endeavor methods. Introspective and emotional religion has had its day here with a large number. The parish stands ready for social work, it seems to me. The church on the other hand consists very largely of old people who have passed the vigor of their youth, but who are very faithful, of children and unmarried women. One feels that tho a dutiful church it is not especially vigorous. It numbers about two hundred and pays, say, \$1,000 a year and a free parsonage, neat and in good repair. It has all the usual organizations, but the only one really alive seems to me to be the Parish Sewing Circle, which is rather a remarkable social power. This has been managed entirely by the ladies, and is a striking example of efficiency and usefulness.

"The worst thing about the situation is that the church seems to me and my brother not to touch the needs of the town. Perhaps we are no judges, for I am an attendant, but not a member, while he is away more than half the year. But he, in New York under Percy Grant, and I, in Providence under Floyd Tomkins, have seen enough of the more aggressive side of church work to be aware of the home deficiencies. This church, the First Congregational one, is in a good field for work, and ought to be a power in the town.

"The strength of this town is in its working population. For four years now I have watched the show, and I am more than ever

convinced that the man with the dinner pail is the man who rules here. I have heard some snobbishness against him, and some lamenting that the town was growing up to such small houses, no people of any consequence coming in; but, by my democracy, I'm glad of it. I like and respect the man with the dinner pail. He works hard, is sober, honest, good to his family, an independent thinker, if not a deep one, and he sends his son to Bowdoin College now and then I believe. We have property here to some extent and some vice, and some, tho mostly imported, squalor, but a good deal less of it than I have seen among the working-populations in other places. The man with the dinner pail generally owns a house or rents a whole one, and has a little garden which he often cultivates on Sunday. Sometimes he goes fishing on that day or takes his children out. Generally he has little to do with parsons. I can't be said to know him well, but all I have seen of him I like, and I suspect he has a soul, only it does not go to our church. In my opinion he forms the bulk of the moral strength of our town, tho the church and parsons would dispute me hotly.

"On the other hand, there is no fashionable class, no exclusive set, no faction in the town based upon money, family, culture or pride. And there is no very rich person. We are upper middle and lower middle classes as I should divide the town, not without our sins and our self-sufficiencies, but still *fairly* tractable material. Some there are no doubt like the Episcopal lady, very high up in church circles (I should not dare hint who she is, tho she said this to me myself last winter, so I know it is true), who lamented that nowadays the Church was 'taking in all the rabble!'

"The man who works here would need to be a good organizer, a man among men, a man acquainted with modern social ideas, yet tactful enough about their presentation not to attempt to *drive* the people into strange ways—

(for the right man could *lead* them anywhere) —and not an inferior preacher. It is a good deal to ask for a small place and a small return, and yet it simmers down to a man who has the power of making friends with all classes and who knows how to put others to work. The right man at the beginning of a career would find this a good place to get his experience. The stuff to work with is good, the conditions are good, the church is not dead, but sleeping. But unless we get the right man, we shall be dead, sure! I say, and my brother agrees with me, that Mr. A. and Mr. B., teachers in our high school, are doing a larger moral work in this town than all the churches (Catholics excepted) combined. A man who could do what they are doing, as well as they are doing it, would meet with a response."

I at once sent the name of the only man of this type whom I happened to know who was not already in a much better place, and a week later I had to write again and tell my friend that this man had just been called to lead a rather forlorn hope in a downtown city church—a call which he has since accepted.

There is coming to be a strong demand for this type of minister, tho probably few churches could formulate their wants as clearly and forcibly as my correspondent. The worst of it is that it is a demand almost impossible to fill. I asked a recent graduate of one of our largest and most progressive seminaries how many of the thirty-five members of his seminary class would fill the requirements of this letter, and he replied: "Only two or three." Writing sermons, conducting funerals, leading prayer-meetings and making calls are only the alphabet of the modern minister's equipment. The deeper questions are: What common desires for individual and social betterment can he inspire in the hearts of his people? Into what states of mind and habits of life does he propose to lead them? and, Has he at command the methods of influence and organization which will bring things to pass? We have been keeping up machinery, almost forgetful of the specific product our machinery is constructed to turn out. In fact, we have been running it on patterns and styles of goods for which there has ceased to be any considerable demand. What wonder that dividends are falling off! What wonder that committees are in despair!

Not to leave too pessimistic an impres-

sion, let me tell briefly how a young minister of the type that is wanted set to work in an old conservative parish, made up about as the one described in the letter. Like most churches of its type, altho by far the strongest Protestant church in a community of six thousand people, it had among its 213 members only six men under forty years of age. At the very first opportunity for uniting with this church the young minister led into the church seventeen new members, thirteen upon confession, of whom seven were young men. These young men were normal, healthy, vigorous, athletic fellows, fond of all outdoor sports and all phases of youthful social life. It is doubtful if any one of them had ever been in a prayer-meeting; certain that no one of them had ever "taken part" in a religious meeting of any kind. Nothing in the way of introspective or emotional piety was expected or required of them. The minister presented to these young fellows, trained in Christian homes to be sure, but never subjected to pietistic tests, the simple fact of the church and what it stands for in the lives of their parents, their homes and the community, and asked them to take sides for or against it; either to lend to it their strength and influence, their time and work, in such ways as might be natural and helpful, or to stand outside in selfish isolation. These young fellows responded, as ninety per cent. of well disposed young fellows between fifteen and eighteen will respond wherever the issue is put before them in plain, practical, objective terms. Luckily, there were no Pharisees on the church committee to block their entrance by setting up standards of morbid, mature or emotional "experience" to judge them by. They chose to give themselves to Christ and his Church, in so far as they had come to understand what Christian life meant in their own homes and in the community in which they had been brought up. They are not perfect yet, and no one of them has been moved to testify to what has (or has not) taken place in his soul. Indeed, it is doubtful if they have gone to a dance the less or a prayer-meeting the more in consequence of having united with the church. But they have motives for being pure, and kind, and true, and

helpful, which they were less conscious of before; and the church is much more strong and hopeful in consequence of this infusion of fresh, enthusiastic young life. The time will doubtless come when athletics and popular entertainments will attract them less than at present, and introspective piety will count for much more in their scheme of life. But it is a fortunate thing both for them and for the church that they have not waited for these developments before coming into the conscious fellowship with Christ and the Christian Church. The church, which had expected, or been supposed to expect, these developments to precede admission, had gone for twenty years without receiving as much of the young manhood of the town as under this wiser expectation came readily and responsively to it in a single service.

Set up pharisaic tests of church membership and you will have the five per cent. of Pharisees there are in every community as members of your church. Set up sentimental, introspective standards, and the half dozen highly emotional men there are in every thousand, together with the women, will make up your list of members. Make the standards plain, practical, objective, institutional, a respect for what the church is doing, and a willingness to help in its good work, and the vast majority of all right-minded, well-trained young men will flock to these standards. The church needs leaders who, whether with more or less of linguistic and antiquarian lore, can put the opportunities, responsibilities and heroisms of the Christian life before people with the tact, the persistence, the winsomeness, the compelling power that a salesman has to have in order to sell goods. Less of the orator making formal discourses, more of the agent pushing his Master's claims, more of the advocate talking straight to the point, more of the diplomatist sensitive to the springs of youthful motivation, and massing upon the individual and collective mind the considerations which lead to prompt

decision and sustained action—these are the qualities that are wanted in the modern minister.

At present law and business, medicine and the higher kind of teaching are getting far more and the ministry far less than a just share of the sort of men who would succeed in any one of these five callings. The reason is partly because young men have felt that the demand of the public has been for the sentimental, pietistic type of minister. Let the young men once understand that wholesome, generous, serviceable living is what it means to be a Christian, and that wearing their hearts upon their sleeves for exhibition to their fellows is no essential part of the process, and let them understand that the minister is simply the man who has studied the principles of this life more deeply, and makes the extension of it among men his specialty, a representative and agent of Christ's life in the world, not a mere mouthpiece of views about Him and sentiments toward Him, and the Christian Church will be in a fair way to recover its rapidly waning prestige.

Morbid, narrow and inadequate tests and conceptions of what it means to be a Christian in thousands of our churches are keeping out youth and manliness, and letting only effeminacy and sentimentalism in. Not long ago I found on inquiry that the 250 Congregational churches of a whole State had on an average only two or three young men in their membership. To restate the meaning of Christianity in genial, sensible, practical, vital, social terms in place of the dreary dogmatism, and driveling emotionalism, and morbid introspection, and ascetic repression with which it is identified in multitudes of minds, is the great task of the Church of the twentieth century. The field is white for just such a harvest as the young pastor replied in the church to which I have referred and for which my correspondent is longing. Let us pray and work that the Lord may send forth the right sort of laborers.

BRUNSWICK, MAINE

The Non-Partisan in Politics

By Samuel M. Jones

MAYOR OF TOLEDO, OHIO

THE non-partisan in politics bears the same relation to the political world that the non-resistant bears to the world of warfare. As the non-resistants are the only force that is really making for an end of war and the beginning of "peace on earth, good will toward men," so the non-partisans in politics are the force that is eliminating war—hatred, envy, revenge—from the political field and making for the organization of the people on a basis of patriotism rather than partyism, and for the adoption of love and reason as the ruling and guiding motives, instead of remaining subject to the domination of hatred and revenge. The resistants, the fighters, are unconsciously advocates of eternal warfare, for it is clear and certain that there is no way to put an end to war except to cease fighting. The greatest victories of all time have been gained by the non-resistants, from the victory of Jesus on the cross at Calvary to the triumphs of the non-fighting religious orders and sects, as the Quakers, Mennonites, Dunkards, etc.

Every inch of progress that has been made toward political liberty in this country has been and is due to the work of the independent voter, the self-owning, free man. Had the advocates of partyism had their way liberty would have perished long ago, and the republic would even now be only a memory; but the seed of democracy having been once planted on our soil, the people having been committed to the idea that "all men are created equal," the principle has steadily grown until the cloud that one hundred years ago was "no bigger than a man's hand" has now become so large, so powerful and so overshadowing that the aristocratic principle cannot raise its head in its presence. All this has been due to the ever-growing independent voter, the great army of farmers, laborers, carpenters, blacksmiths, railroad men, sailors, etc., the mass whom nobody owns, who stand aloof in every election

watching and inclining victory this way or that, knowing no political boss, calling no man master—these have been the guardians of liberty and have stirred the soil and watered the ground where democracy has been planted, until now the promise is brighter than ever that America and American democracy shall yet be a great tree, whose fruit shall be a blessing to all the peoples of the earth.

These are my musings as I reflect upon the revelations of the past.

Looking now at the last municipal election of this city from a perspective of some three months, perhaps I can more safely write of its meaning and predict its result than I could have done three months ago.

Many of the congratulatory letters and telegrams that came to me referred to the election as "your wonderful victory," when, as a matter of fact, to call the victory a personal one for any man is to belittle and rob it of its most important meaning. It may be helpful, to get the subject fairly before the reader, to refer briefly to the political experiences with respect to the Mayor's office in this city during the last six years.

Six years ago I was elected to this office as a Republican when I had been but four years a resident of the city. Two years later, heart-sick, often almost heart-broken, with the depravity of partisan politics, I bolted the convention, that by outrageous methods common to party organization defeated my nomination, and became an independent candidate. The convention had been unblushingly corrupt, and the whole city was outraged with the bare-faced affront to every semblance of decency on the part of the Republican machine that defeated me. As a consequence there was all through the community a vicious desire to strike back and to "smash the machine." I received an overwhelming vote (nearly 70 per cent. of the whole) and soon after announced that I was henceforth and for all time *a man without a party*. Nomi-

nated by petitions circulated on the streets, two years ago I was elected for the third time without the aid of the political machinery of organization. Long before the close of my third term I had fully decided to retire from the field after six years of active experience, a good portion of which was spent in battling with partyism in one form or another; but I had been steadfastly advocating the abandonment of parties and party machinery as the only hope of liberty for the municipalities, the States or the nation.

Under these conditions petitions began to come, asking me to become a candidate again, and it was easy to be seen that when they became sufficiently numerous I had no choice left but to accept the call of the people. I was, however, in this campaign to meet a new and wholly unexpected experience.

In all former campaigns I had the support of one or more of the daily papers. In the first campaign the pronounced support of almost the entire Protestant clergy, and in the second campaign almost every labor union in the city had indorsed my candidacy. In this last campaign the new condition that I was to face was first made apparent when, on the 17th of March, after the people and the papers had been anxiously trying to find out for weeks "what Jones was going to do" with respect to being a candidate, I gave out my letter of acceptance of the nomination by petition. I was astounded to find that every daily paper in the city with the exception of the *German Express* refused to print it, and not only that, but openly announced their opposition to my election. Here were "Democratic," "Republican," and "independent" papers that had been making war upon each other for years, loudly proclaiming the virtue of the principles represented by one over those represented by the other, at last united on common ground. *They were all against Jones!* The two Republican papers refused to give publicity to the campaign at their regular advertising rates.

Here was a certainly striking situation. For six years, three successive terms, I had been the chosen representative of the people in the Mayor's office, once as a so-called Republican and twice as a man without a

party. There had not been the slightest whisper of scandal in connection with my administration or the slightest intimation of a charge of unfaithfulness or unworthiness, and yet here was the entire daily press of the city arrayed against me as a candidate of more than five thousand voters who had signed their names to petitions requesting me to become a candidate. And what was the cause of this opposition?

In all candor I am forced to the conclusion at this distance from the election that the cause of it was just exactly what I stated at the time—it was found in the fact that I insisted upon my right to be a free, self-owning man. I do not in the least reflect upon the management of these papers, but the belief in machines, in organization, in parties, is so deep-seated that a man's refusal to belong to any of the machines, his refusal to be owned, as it were, arouses in the minds of those who confess that they do "belong" to this party or that, this machine or that, a sort of resentment, and unconsciously they incline to regard such a position as a sort of impertinence, a sort of reflection upon all those who do "belong;" and it is my belief that to this cause, more than to any other, can be traced the opposition of the daily press of Toledo to my election in the last campaign. It was the same cause that inspired opposition in the party machines. One machine had no more use for me than another, simply because I could not be used by any machine. I know well that some of the managers and owners of some of the papers that opposed me sincerely believe that I am unfit for the office, that I am a "demagog," that I "lack dignity," am a "mountebank," etc. Yet, notwithstanding all this, I believe my greatest sin is the one I have pointed out.

I am writing with great freedom and using the personal pronoun "I" with an abandon that may easily be misunderstood, but I must speak plainly. I am seeking to set forth the truth, and I cannot shilly-shally.

I have never had a program; I have never planned a campaign to reform society, the city or the world; in short, I am unconscious that I have ever done anything more than has been done by the "least of these my brethren." I simply

have tried to keep at peace with the eternal hammering within my breast, and as I have looked into the hopelessness of our party system of politics I have thought, as I said in my last message to the council, that

"I am utterly unable to see how ten millions of years of organizing men into hostile bands for the purpose of making warfare on each other with the end to be sought the capture of the offices of government, in order that they may be run for the benefit of the 'party in power,' is to give us anything but a continuance of the failure to secure those conditions of political peace and social justice for which all patriots are earnestly striving and all partisans, as such, are seeking to make impossible."

Political parties have been useful in the past, and, to some extent, remain so. Their existence is indicative of the childhood period of political development of society. As individuals and society mature they become unnecessary. As men become full grown—become men—and stand alone, learn to think for themselves and to say what they think, they discover that not only do they not need to "belong" to a party, but that to confess the ownership of a party over them is to limit their usefulness, hinder their growth; and as the spirit of democracy grows apace and men enough of this sort are developed, we shall have a society in which the existence of parties or political machines (for that is the party) will be unknown.

Really, the party system is to-day played out. It is in many of its phases so grotesque as to be laughable were it not pitiful. The bare idea that a man does not know what he thinks until a "convention" has been called and a Committee on Resolutions has met, and the resolutions have been drawn, submitted to the convention and accepted, and a "platform" has been written—then the man knows what he thinks!

He thinks with his party; or, if the platform of his party does not meet with his approval, then he waits until some other party writes a platform that does; then he declares his belief with that party. But as, according to the prevailing ideal, the purpose of life is individual success, and success means possession or position, and as changing one's party is considered to be damaging to his chances of winning "success"—particularly

through getting office—the prudent man, the wise (?) man, will be very slow to change his party, no matter what its declaration of principles may involve, particularly if it is the majority party in the political division in which he may be located.

Here is shown the hopelessness of the party system. It is contradictory to the fundamental principles of patriotism, the idea of oneness, of unity, and because of this it does not afford one single ray of hope to the patriot who looks upon the city, the State and the nation as a partnership of the people, and the purpose of the partnership, its real business, is to organize the people as a corporation for doing the public business in the best way that it possibly can be done—that is, the most economic, the most artistic, the most scientific way that it can be carried forward.

It is clear this ideal can never be realized until our politics become a religion, or, to put it better, until our religion and our politics become one; until we do not know how to separate our religion from our politics or our business from our religion; until we realize, in fact, that a man's life cannot be separated into fragments; until he realizes that he cannot do the government on one day and call it "politics," his sect on Sunday and call it religion, and "do" his neighbor on the next day and call it business.

The great fundamental idea upon which these States are founded is set forth in the Declaration that "All men are created equal," and this is the mighty task that we, as Americans, are set to work out; and all the spirit of hatred and revenge that fans the flames and keeps the fires of partyism burning must be utterly quenched, annihilated, and patriotism—the love of the whole, the love of all, not a part or party—must melt our hearts into oneness with the last and least man or woman on the continent—aye, on the planet—before we can really make a contribution to this high and holy ideal.

To those who believe in this lofty ideal the last Toledo election is a sign of promise. The vote has a deeper, more definite, more significant meaning for democracy than any former vote of this city, or, perhaps, of any other city in the country. The phenomenal independent vote of the election of four years ago was a vote of

protest against an unblushing outrage committed by a political machine in the convention; the vote of this year was a vote of promise of the rise of the free, self-owning man. There was no criticism of the conventions; they were "regularly and fairly conducted." There was no particular criticism of the candidates; they were "good men." But the public recognized that the candidates under the party convention system are, and ever must be, the product of a machine. Under that system not one in a hundred is ever the spontaneous choice of the people, and the election of "Jones" was not due, as has been so often said, to the "personality of the man," but to the growing triumph of the principle of democracy. In short, the people of Toledo have learned that they can select and elect their own candidates simply by circulating petitions on the street without the aid of any sort of a political machine and without the dictation or connivance of any kind of a political boss. For be it known that in this last campaign or the one of two years ago I did not have a single committee in a single one of the 105 election precincts of the city, and, in addition, as has already been stated, had the pronounced opposition of all the daily

press and practically was without the support of any of the so-called "organized" agencies of society.

I enter my solemn protest against the belittling of this movement by attributing its "success" (?) to the mere personality of an individual. It is the rising tide of the democratic spirit, indicating to the political kings that the day of their doom is now appearing. America has no use for kings of any sort. They will be dethroned as were the hereditary kings of old. They must go to work and earn their living with the rest. That is a part of the meaning of democracy as indicated in the Toledo election.

"Come, I will make the continent indissoluble,
I will make the most splendid race the sun ever
shone upon,

I will make divine magnetic lands,
With the love of comrades,
With the lifelong love of comrades.

"I will plant companionship thick as trees
along all the rivers of America, and
along the shores of the great lakes,
and all over the prairies,

I will make inseparable cities with their arms
about each other's neck,

By the love of comrades,

By the manly love of comrades."

TOLEDO, O.

The Courage of Fear

By Edith M. Thomas

THERE be who are afraid to fear,
The myrmidons of Hope!
Their watchword cannot lend me cheer
'Gainst that with which I cope!

There is a courage of the lost,
Who sail uncharted seas,
Past many a firm, or flying coast,
And I must sail with these.

There is a valor of the slain,
Who strive past mortal sight
While their spent corsés strew the plain,
And I must fight their fight.

Hast thou that courage of the lost,
Past theirs, that reach their goal,
Whoe'er thou art, I thee accost—
Thou Comrade of my Soul!

Thou dost not fear to fear—ah, no!
The depths wilt thou descend;
And when thy planet sinketh low
Wilt make of Night a friend!

Then come! We two are proof, at last,
We dare our fears to own;
But had our lot with Hope been cast
What heart-break had we known!

WEST NEW BRIGHTON, N. Y.

The Decision

By Churchill Williams

AUTHOR OF "J. DEVLIN—BOSS," "THE CAPTAIN," ETC.

S HOT up in the elevator to the third floor, Santley laboriously made his way to the third door on the left, and opened it softly. In the window embrasure stood Armstrong. He was looking down on the broad asphalted street of the State Capital, which led to the river, glimmering through its fringe of maples, and he did not turn until Santley spoke. "Hugh, I've come up here as a friend."

"As a *friend*?" echoed Armstrong, as he faced about. "And yet——" he began. There he checked himself, and added, slowly: "Santley, you've known me ever since we used to get licked with the same ruler up at Oak Creek, and I——"

"And you always were bull-headed till now." Santley grinned. "But now you're going to show a little horse sense." Santley was a big man with a good-natured face and an indefinable air about him of enjoying, regardless of price, whatever the hour should offer. It was his second term in the State Senate, and with experience as his mentor and an honest liking for Armstrong, edged with an entirely impersonal admiration for independence to urge him on, he had come to the third floor this day to attempt a task which his knowledge of Armstrong warned him was well nigh hopeless. The tall young man with wide mouth and close-set lips looked him unwinkingly in the eyes and made no reply, and suddenly he broke out: "Hugh, you're a cursed fool."

"You think I am." A smile flickered on Armstrong's lips.

"And Ashford County thinks you're a fool, which is more important."

"I'm in no danger of forgetting that?" said Armstrong. He drew a bundle of letters from the breast pocket of his coat, and extended them to the other. "A sample of what I've been getting all of this session," he remarked.

Santley waved them aside. "I know what's in 'em. And, what's more, th'

men that wrote 'em mean what they say. It's your last term in the Legislature, if you don't show the Ashford people that you can and will get for 'em some of th' things they expect of their representative."

"Show them I'm willing to sell myself to win support for their appropriations, you mean." Armstrong spoke almost wearily. An impulse which he did not identify stirred Santley. He walked over, and laid a hand on Armstrong's shoulder. "Hugh, old man," he said, "you've played the reformer long enough. I know you're sincere. Ashford County knows it. But that ain't th' thing. Th' people that sent you here see that it doesn't pay. They're crying quits. They want their share of what's being given out. You represent 'em. They've got to get it through you, or go without it. They're asking you now to do what they want. I'll bet th' letters you have there came from some of th' very fellows who voted for you as representative. Ain't that so?"

Armstrong's mouth hardened, and Santley went on: "I can't see for the life of me what you've got to gain by bucking against everybody. You can't make things go your way, and you'll not go th' way anybody else wants. What th' dickens is th' use of that? Tell me."

"Th' use——" began Armstrong, swiftly, and as quickly halted. "You don't understand," he said, slowly. "You couldn't understand. There's no use talking about it."

Santley's hand fell to his side. He gave a grunt of disgust. "Then you're going to vote against th' Traction bill tomorrow? Just th' same as if there was a chance of knocking it out?"

There was no response. Armstrong's face was turned toward the window once more. Santley repeated his question, and continued: "Because, if you are, you might as well pack your bag. Th' bill'll go through, and th' ring here'll drive you out to pay you for your trou-

ble, even if your people up at Ashford County send you back next term, which they won't."

"Tom," said Armstrong over his shoulder, "what's the use? You're wasting your time, I tell you you are. Go down to the crowd. Remember what you said—I'm bull-headed."

Santley swore vigorously, and stood a moment, reluctant. Then he struck his thumbs under his suspenders, snapped them, and left the room.

Armstrong stood by the window for half an hour, his chin on his arms crossed on the sill. After supper he stepped out into the street. June was passing in floods of sunshine and moonlight. The asphalt radiated heat. From the open windows of the hotel came a glare of gaslight, and bursts of conversation and laughter. Armstrong walked toward the river. He had spent many hours on its banks.

Under the archway of maples it was cooler. When he was at the water's edge he dangled his leg over the stone coping of the river wall and laid his hat beside him. He watched the line of tree-tops darken. A fishing crow flapped heavily up the river. His eyes followed it, and recollection carried him a hundred miles to the Northwest, to his own town, nestling among the hemlock hills. It was more than a year ago and he was boarding a train for the State Capital, the representative-elect of his people, his heart beating high with pride and expectation. The strains of the local band and the cheers of the crowded platform rang even now in his ears—"speeding on our distinguished and determined fellow-townsmen to win lasting fame in a victory for honest government," the *Oak Creek Clarion* had said. It was all waiting to be won then, and *he* was the irresistible champion. Hardly had the home station been left behind, as he recalled, when he had shown his metal. The conductor of the train had been for passing him by with a touch of the cap and a smile. But Armstrong had halted him and insisted upon the collection of his ticket. He had heard how these things were done, and a frown had checked the conductor's explanation, "Members of the Legislature are always passed over this road free." Armstrong remembered

but one remark in the brief, propitiatory conversation which followed. It referred to a girl a few seats ahead of him—a girl with softly rounded cheeks and waving brown hair. "The Governor's daughter going down to the Executive Mansion—been visiting a friend in Ohio," the conductor had volunteered.

What had stirred in Armstrong at first sight of the Governor's daughter? Politics had had a rival for him from the onset of his journey. A tilt of the chin, a way of holding a little gloved hand palm uppermost, as if inviting a stronger hand—these things by some magic had seized upon his imagination. Soon he was speculating how he should meet—the Governor. As time went on other discoveries were made by his heart, which sweetened or tormented many lonely moments. For, having met the Governor, it happened that the doors of the big brick mansion by the river opened to him many times, and proffered temptations which the loosest construction did not place within the lines of legislative duty. Conscience-smitten, yet rejoicing, he had attacked his work with new energy. Nothing should be allowed to interfere with that. And yet to what purpose had this all been? At the first encounter worthy of the name he found himself deserted, aye, repudiated by those who had sent him into the fight.

He crushed a handful of gravel and threw it from him. He picked up his hat, and got upon his feet. He walked slowly along the road which followed the river in its bends. It was dark now, and through the trees he saw twinkling lights. Presently he was abreast of these and halted in the shadow of a tree. The house was square-fronted, of weather-stained brick, its stoop and portico netted with vines. On the stoop a man sat, smoking. His sweep of hair, strong, curved nose, and peaked beard were silhouetted against a window-frame of light. It was the Governor.

Armstrong watched him, unobserved, then suddenly strode forward, checked himself, and again walked on. And so to the steps of the house. The Governor recognized him with a word of welcome, and made a place for him beside his own. But Armstrong stood where he was and asked: "Governor, will you tell me now

whether you intend to sign the General Traction bill which will be passed by the House to-morrow?"

The Governor gave a start and stiffened. His lips parted, a patch of red burned on his cheek bones. Then his eyes softened, and he fell to stroking his beard. "Armstrong," he said, deliberately, after a moment; "why do you ask me that?"

"Because, if you intend to sign that bill, you have reasons for doing so which a man in my place should know—reasons which you are not ashamed to tell."

The Governor had expected this. Armstrong and he differed radically on some points of their political duty, but these frankly expressed differences had only cleared a friendship of suspicion of insincerity. The boldness of Armstrong's question was characteristic. The speaker stood with shoulders drooped, his head craned forward, his fingers knit, his eyes searching the other's face. Perhaps, something in the earnestness of the pose recalled days to the Governor now thirty years gone by, when for him likewise there had been no middle road and finger-posts were few. At least he understood that this was no time for refusal. "I will tell you what you want," he said. "But first I should like to hear from you your reasons for opposing this bill."

"I have but one. That is enough. The power which this bill will give to men who have neither honesty nor mercy."

"But the bill will make possible increased railroad facilities," suggested the Governor. "And is not that in the interests of the State?"

Armstrong's answer came quick and sharp. "Is it? Is the price which the people will have to pay for every new rod of track laid, the price which their representatives should lay upon them?"

"But they say—the men who are back of this bill say——" began the Governor, and got no further.

"Governor!" Armstrong spoke in a yearning voice. "Governor, won't you speak to me as a *man*? This is a great question. It is a crisis—to me. I need light. If there are any reasons in which you believe as a *man*—tell me those reasons, Governor."

In the period of silence which followed many things passed through the Gov-

ernor's mind. He realized when he spoke that he was stating a fact—a fact which he had accepted after long debate with himself, with the honest belief that it was for the best. Yet something made him feel shame. "There is one strong reason why this bill should be allowed to pass," he said. "It is the actual need for other legislation this session. You know that we should have immediately at least \$300,000 for schools, and as much more for hospitals. If appropriations for schools and hospitals are not made before adjournment a great wrong will be done. Our schools are inadequate now; the State must assist promptly and generously in the work of caring for the sick and hurt, either that or the work will fall off. Is it not the duty of the Legislature and the Governor to see that these appropriations are made?"

The Governor's gaze was on the ground, and he went on quickly as if knowing that no reply would be made. "You know that it is. I know that it is. And neither of us may evade the responsibility. What shall we do then when we take up the question and find that there is but one way to perform it? Shall we refuse to go on because—because we must compromise on a principle—a principle in which we may be mistaken, after all? Yet that is exactly the choice we have. No appropriations for schools, or for hospitals, or, in fact, for any object may be made in this Legislature without the approval of a majority which is controlled by the men who are interested in this General Traction bill. They will hold up every other legislation until their measure is passed—and signed by the Governor. They are within the letter of the law, too. I cannot change their purpose. Therefore, I will—sign the bill which they will pass in the House to-morrow."

The Governor raised his eyes half-defiantly. The eagerness in Armstrong's face had been blotted out by disappointment; his lips twitched. But there was no surprise there. He raised his hand and pushed back the heavy hair from his forehead with a gesture of impotent resentment. "I thank you," he said. "It was as I expected."

The Governor reached out a hand. "Armstrong," he began. But then a

voice came from the doorway behind them, and Armstrong bowed to the Governor's daughter as she stepped out on the porch. She stood beside her father. "A political debate?" she queried, "I thought I caught the word 'bill.'"

"No, it was not exactly a debate," the Governor returned.

Armstrong started to go. He was bewildered; he wished to find a way out. But the Governor's daughter came and seated herself on the step, leaning her head against a pillar, and she asked him to stay. The Governor said he had letters to write and went into the house.

Armstrong looked down at the smiling face upturned to his and realized that it was not to be denied. An old hunger for her counsel and sympathy seized upon him. He sat down beside her, leaning against the railing; and her story of the day's doings drew him into a conversation under cover of which he found himself studying the play of expression in her dancing eyes and tender mouth. How long had he loved her? How long was he to love her mutely? Always? To-night she was further from him than ever, yet in one way she had never been so near.

She had been making some half-serious remarks upon men in general and their faults, and all at once his own position was flashed upon him by her statement, "Yes, women erect ideals and are true to them, even when the world says their ideals are nonsense. But men, men often abandon their ideals the moment experience proves those ideals to be impracticable. I have read somewhere that men have the courage of their convictions only when courage is complaisance. I am afraid that is true very frequently."

"You think that a man who starts out to do a thing which he believes in should keep at it even when he sees that he can't accomplish it all?" he asked, eagerly.

"It will be accomplished if he keeps at it—and he is the right sort of man."

"But suppose that persons who are older than he and who ought to be a great deal wiser show him that he is going to do a lot of harm indirectly—to others—by keeping up the fight?"

"He must judge of that for himself. If the thing is worth doing he ought to go ahead. Right is right, and will be justified of her children."

"But right does not prevail—sometimes," he persisted.

"But it *is* right. And—oh! well, if you are talking of the sort of man who fails, he had better stop before he begins," she declared, with disdain. "The world is full of well-intentioned men. The man I am talking of is the man who makes others do his way. He is bound to come out on top."

Armstrong was silent. Hope, rekindled in him at her brave words, had been smothered by that last contemptuous reference. A year ago the imputation which he took to himself would have made him boil with resentment; now he bitterly ruminated on its possible justice. "I suppose so," he said. "And women always look for success in a man, don't they?"

"Of course they do," she returned, instantly. "Why shouldn't they? Success stands for courage and energy and all that. It proves that the man has something in him which many other men haven't. Women want to be proud of what they love."

"And they cannot love one they cannot be proud of?" he asked in a low voice. He was looking over toward the river, and hardly knew that he had spoken. But she was searching his face, touched by the unconscious wistfulness of his words.

"I will be proud of the man I love," she answered, softly. "He will be the kind that succeeds."

"Yes, yes; he will be the kind that succeeds," said Armstrong, and came swiftly to his feet. He held out his hand, and his fingers closed on hers convulsively for an instant. He had said good-night, and was walking away almost before she realized it.

* * * * *

The House was passing the General Traction bill. The Hall of Representatives, with its amphitheater of seats, its white walls hung with the portraits of bygone lawgivers, was bathed in sunlight. The Speaker, deep in his chair on the high platform, languidly surveyed the floor where members lolled and fanned themselves. The hum of a score of low-toned conversations mingled with the official droning of a clerk. Some men cursed the heat and some dozed. The battle over, the bill had long before

been fought, and the issue decided. The spoils had been allotted. Some were indulgent, some impatient at the formality of proclaiming this.

Then the clerk began calling the roll on the vote, and a few men looked up. "Abbott!" A voice drawled "Aye." A chuckling murmur greeted the joke. "Acker!" and "Aye!" and its derisive compliment were repeated. "Adams." "Agnew." "Apford." Each time an "Aye!" and fainter applause at the empty registry of opinion. Then heads everywhere were raised.

"Armstrong!" fell from the clerk's lips with added emphasis, and a tall, spare figure shot up in the center of the House. The "backwoodsman" was eager to declare himself, as those around him had expected. Curiosity was mildly pricked. They had watched for him with an interest which not another man among them would have won. There was respect in the intent of those hundreds of faces, but of the tribute he was no more conscious than they. For him it was only the moment of his enunciation. And she was there to hear! There was a bitter triumph in that.

She was in the Visitors' Gallery on the right hand. He saw her lean forward as his name was called. His eyes looked straight into hers, and there was defiance in them as his "No!" rang out. He fancied that her cheeks burned at the laugh which caught up the echo of his response. Then she drew back, and his

glance darted at the nearest of those who jeered him. It was over. He drew a long breath, and suddenly his muscles relaxed. Soon he rose and walked from the room.

Outside he leaned against a column of the long porch where the terraces stepped down to the street. A haze hung over the valley toward the North. His gaze softened as it rested on the purple mass of hemlocks far beyond. Home? Yes, he was glad now that it was to be home for him. And then he heard a step behind him and turned.

She was close to him, breathing quickly. "I have been hurrying to catch you before you—before——" She stumbled, and in that moment something caught him by the throat. "I saw you leave," she said, "and I wanted to say—to say——" Her words died away in a tiny gasp. She gave a bewildering glance behind her.

"You are sorry——?" Armstrong began quickly, and as suddenly was smitten dumb. Back to him came her voice, "The man I love will be the kind that succeeds." He had not succeeded. He stiffened and drew back a little. Then more softly, her words repeated themselves, "I will be proud of the man I love." Proud? Of what? Of whom? And he looked into her eyes, and in an instant he had passed from blindness to understanding, and all the world was held within the clasp of his arms.

PHILADELPHIA, PA.

One Prayer

By Theodosia Garrison

LET me work and be glad,
Oh, Lord, and I ask no more;
With will to turn where the sunbeams burn
At the sill of my workshop door.

Aforetime I prayed my prayer
For the glory and gain of earth,
But now grown wise and with opened eyes
I have seen what the prayer was worth.

Give me my work to do,
And peace of the task well done;
Youth of the Spring and its blossoming,
And the light of the moon and sun.

Pleasure of little things
That never may pall or end,
And fast in my hold no lesser gold
Than the honest hand of a friend.

Let me forget in time
Folly of dreams that I had;
Give me my share of a world most fair—
Let me work and be glad.

NEW YORK CITY.

The Life of a Jack Tar

By C. J. Hicks

[The tar who spins this yarn is a gun captain of the first class aboard the "Indiana." He was recommended as their Nestor by a group of enlisted men aboard the battleship lying in the Brooklyn Navy Yard. "What he doesn't know of the navy nobody knows," they said. He began operations by opening his ditty box and showing his papers as an evidence of good faith. Then, comfortably chewing a large quid of tobacco, he repeatedly circumnavigated a small area of the gun deck, the interviewer following and listening to a stream of biographical reminiscence and reflection which ran steadily for three hours. What he had aboard his mental bark was a full sized book of sea lore and experience, of which what follows is only a brief and inadequate skimming.—EDITOR.]

"For to admire and, for to see,
For to be'old this world so wide;
It never done no good to me,
But I can't 'elp it if I tried."

—Kipling.

I GOT into the American navy by mistake in the first place, but I have stayed there twenty-eight years, and I suppose I shall continue in the service until I am no longer of any use to it and shall have to retire ashore.

I was born and brought up in Virginia, and my people were pretty well to do, but I was a restless sort of youngster with a desire to see the world, and so it came about that I left a good place where I was earning \$12 a week as a sort of subforeman, and made a trip to Washington—just to see things.

This was in April, 1876, and I was seventeen years of age. Previous to this I had tried many occupations, but none of them exactly suited me. I had been a painter for a few weeks, but wielding a brush that weighed a pound and a half made me tired, and I left the place and became a carpenter. That did not please me, either, and at the end of a month I became a machinist instead. In the shop where I went to work I found that they cut the metal with lathes. I didn't approve of that—I wanted a hammer and chisel. So I left that shop and went back to school, but only remained one day. Then my uncle took me in his tobacco factory, and I worked there, receiving free board and clothes and liberal pocket money. After three months he said he would engage me regularly, and I asked:

"How much will you pay me?"

"Ten dollars a week," he said.

"Smith offers me \$12 a week," I replied.

I left my uncle and went to Smith, where I stayed two years, having charge

of a room. I got along well, but still I wasn't satisfied. I wanted to travel and see things.

So I told Mr. Smith that I was going to Washington for a visit. He paid me off, and away I went, having a friend with me. After viewing Washington we went to Baltimore, where we put up at a hotel, and wandered all about the city, taking in the sights. At last I took a street car down Laight Street to Henderson's Dock, where I saw a strange looking ship lying. She had guns sticking out of her side and a man in uniform with a gun in his hand was walking up and down in front of the gangway. He looked as if he belonged to the ship, and as I was always very inquisitive I walked up and asked what she was.

"She's the 'Juniata,' just come back from the Arctic regions," said he. "They're using her for a training ship now."

"What's that?" I asked.

"A ship where they make sailors."

"Can I go on her?"

"Yes. Ask for the sergeant, and tell him you want to ship."

I didn't know what that meant, but when I found the sergeant, I said:

"I want to ship."

"You'll have to see Captain Greene," said he.

He took me to Lieutenant-Commander Kellogg, who took me to Captain Dana Greene. They were puzzled, and said that I didn't look like a poor boy.

I said that I wasn't poor.

"Do you want to ship?" asked Captain Greene.

"Yes, sir," said I.

"Well," said he. "You know, my boy, that beginning this way you can never become a commissioned officer, but you may get to be non-commissioned."

I began to understand that they were thinking of taking me to live on the warship and travel about with her, and I thought that that might suit me very well.

"Is your guardian in the city?" the captain asked.

I said that he was, and gave the name of the friend who had accompanied me from home.

Captain Greene told me about the examinations, and the papers that I must have made out, and asked if I had any money.

"Oh, yes sir!" said I. "How much do you want?" I produced \$170.

He explained that he merely wanted to see that I didn't lose it, and after giving me some advice sent me to get my guardian and go before a court to comply with all the regulations.

A little later I got in the hands of the ship's corporal and my new messmates. I was informed by the latter that I should have to give up my jewelry and my shore clothes, and I was duly skinned—I found out afterward that I needn't have given up these things.

The ship's corporal fitted me out, and I was given a hammock and rope yarns, and told to sling it. That was quite beyond me, but when I offered fifty cents to any one who would sling it for me half a dozen jumped at the chance.

Supper that night consisted of black tea without milk or sugar and "French pantires," as we called them—the hardest soft of hardtack; we used to bounce them on the deck.

"Is that our supper?" I asked.

"Yes," was the reply.

I didn't eat anything.

For two days I starved. I simply couldn't eat the food, which consisted of coffee and hardtack, and tea and hardtack, and hardtack, salt pork and bean soup, and pork and beans. We would have coffee and hardtack for breakfast, pork and beans and bean soup for dinner and hardtack and tea for supper. Sometimes boullion was served in place of bean or pea soup, sometimes we had "slum gullion"—bean soup with bits of hardtack. On Saturdays we had plum duff and on Sundays molasses and rice as an addition to our fare. Once in a while there were fresh beef and fresh

vegetables, but seldom. There was no table; we ate standing up or sitting down by the mess tarpaulin (a cloth spread on deck to protect it) wherever we could find a place. We had no knives and forks, and had to get along with tin cup, tin plate, tin spoon and our own pocket knives.

As I have said, I starved for two days, and then noticing some of my messmates eating soft bread and bolognas, I asked where they got them. The reply was:

"Bumboat. Ask for Mr. Fick."

I went on deck, and spoke to the first officer I met, who happened to be the quartermaster.

"Do you know where I can find Mr. Fick?" I asked.

"What do you want?" he growled.

"Please, sir, I can't eat the food they serve here, and I'd like to have some chicken."

He gave a tremendous roar, and, turning me around, kicked me back among the other boys. I stayed quiet for a while, but I was very hungry, so I asked a good-natured messmate for Mr. Fick, and he took me to him.

I didn't dare ask for chicken this time, but said that I wanted something to eat. He tossed me a big bologna and a loaf of soft bread.

"Thirty cents," he said.

I laid them on a chest while I turned to pay, and when I looked round again they were gone.

"I laid them down here, sir; but they've gone," said I.

"Swiped," said Mr. Fick. "You'll have to buy some more."

I bought more, and this time held on to them.

For two or three weeks I was very miserable, like an old cat in a strange house, but when I found that I could greatly improve my rations by joining an independent mess and paying a few dollars a month I began to get along better.

The work was all new to me, too, and very hard at first. It was drill, drill drill, morning, noon and night. The drill of to-day is nothing like so severe, because so much is done by machinery. It took twelve men to serve one of the nine-inch guns then, while now six men serve the eight-inch or thirteen-inch guns.

The old gun crew was:

- 1 and 2.—First and second gun captains.
- 3.—First loader.
- 4.—First sponger.
- 5.—Second loader.
- 6.—Second sponger.
- 7.—Powder monkey.
- 8.—Shellman.
- 9.—Right handspikeman.
- 10.—Left handspikeman.
- 11.—Intackleman.
- 12.—Sidetackleman.

There was gun drill and boat drill, single stick, revolver and rifle drills, and, hardest of all, sail and 'spar drill, and every now and then, as a pleasant surprise, fire drill—no warning, we had to jump at the signal.

We went on a cruise to Bermuda with the North Atlantic fleet, and showed ourselves very smart there, but got into trouble for not obeying the admiral's orders. The training ship is not under his orders, and we were right, but all the same it got us blacklisted, and when we made port we were immediately sent out again.

By the time that cruise of the "Junia" was over I had begun to feel very much at home aboard ship, and to think I was something of a sailor.

One day about three months after I had first joined I stood looking at the compass as if it was an old friend of mine. The quartermaster was at the wheel, and I had just heard him say that she was heading nor-nor-east, half east. I had not noticed that her course had been changed immediately afterward.

Up came Lieutenant-Commander Kellogg, and asked: "How's she heading?"

"Nor-nor-east, half east, sir," said I, without waiting for the quartermaster.

"What," said the lieutenant. "Do you know the compass?"

"Oh, yes, sir!" said I.

He came up and looked for himself.

"Get out," he said. "You don't know what you're talking about. Why did you tell me it was nor-nor-east, half east?"

"I just heard the quartermaster say so," said I.

"Very well," said he, "you don't know the compass at all. Now, you won't get shore leave until you learn it."

With that I set to work to learn. I

chalked the compass out on the deck, and I had my nose down in it all the time when I was not scrubbing or rubbing brass or drilling. I went mumbling about it all through my drills, and when I lay down in my hammock the compass was with me till I fell asleep and even afterward, for it came at me again in the shape of a nightmare.

"What kind of a boy is that?" Lieutenant-Commander Kellogg asked the quartermaster.

"He's a pretty good boy," was the report.

Soon after the lieutenant-commander examined me.

"Well, have you learned the compass?"

"Yes, sir."

"Let me hear you box it by the west."

I started in at the north, working east.

"By the west!" he said. "By the west!"

That stopped me, and I went back to north and began all over again, still working east.

"By the west! By the west!" cried Mr. Kellogg.

"Yes, sir," said I, "I'll work round to it, but I've got to go by the east."

He laughed, and sent me to study it again.

The truth of the matter was that I didn't know the compass at all, but had simply learned the points by heart from north by east, and if any one stopped me I had to go back to north and begin all over again. Nowadays the boys have regular cards for learning the compass, and it is quite easy, but in the old times it was a task, but I conquered it and got my shore leave, and soon after was promoted to the second class of naval apprentices, and I worked up without any mishap till I ranked as an able bodied sailor, drawing \$21.50 a month. I had begun at \$15 a month. During this time I changed ships, to the "Monongahela," then to the "Trenton," then to the "Galena."

In 1880 I was in the Mediterranean when the earthquake at Chios buried 1,500 people. We steamed in all haste to the scene, and went to work to help the survivors. We used all our canvas, even to our sails, making tents for them, and

gave them provisions. Then we went ashore with picks, shovels and crowbars to excavate among the ruins, hoping to find some yet alive under the fallen masses of stone.

I had a pick, and when I hit a big stone a sounding rap one of my comrades said that he heard a groan. I hit the stone again, and heard the groan again, and then we all worked like mad, and after half an hour reached the man. It was a Greek priest. He had not been hurt, but was starving to death, as he had been three days without food. He was the only survivor among the buried. We carried him away, and soon had him comfortable.

Three months later while we were lying at Genoa this priest came aboard, fat and smiling, inquiring for the men who had rescued him. The officers didn't know, but he finally found out, and wanted to take us all out to supper. We thanked him, but we would not go.

When a sailor gets ashore he would sooner not travel with a priest.

We went down to Monrovia, calling on our Consul, and cruising about, and got back to the Mediterranean just in time to answer a hurry call to go to Alexandria to protect Americans. On the 7th of June, 1881, I had charge of a boat that had gone ashore to make the sun-down trip. As we lay at the landing waiting for our officers a civilian with blood on his face rushed down to us, followed by some servants.

"What boat is that?" he asked.

"The 'Galena's,' sir," said I.

"Will you lay me alongside the 'Invincible'?"

"Yes, sir," said I, and we rowed him toward the British flagship. He turned out to be the captain of the "Monarch."

"My steward is killed, and another of my men cut down," he said.

Before we got alongside the "Invincible" she had two of her boats armed, lowered and on the way to the shore.

That was the night of the massacre, and the next day we were swamped with refugees. We had 365 aboard, Americans, English, Moors, all sorts, claiming American protection. We did all we could for them, both officers and men giving up their quarters to their guests.

As we left the harbor to take the ref-

ugees to a place of safety the English fleet was going into action to smash the forts and Arabi Pasha. We cheered them heartily, and Admiral Gherardi, who was in command on our flagship, the "Lancaster," was hauled over the coals in consequence, as the Secretary of the Navy said that it was our duty to be neutral. He would have thought differently if he had been there himself.

At Malta, where we landed the refugees, I caught the Mediterranean fever, and when our ship reached Gibraltar I was lying in my hammock on the very edge of death. I heard the two doctors belonging to our ship discussing me. They said:

"He'll die if we take him with us, and he'll die if he's transferred."

I didn't care much what happened. I was very weak, and was burning and stifling in a dark place where I had not room to turn round.

Finally the doctors sent me ashore, and by mistake I was first taken to the military hospital. That was a dreadful place—dirty beyond description and infested with vermin. I was put on a diet of rum and milk, but this proved so attractive to the nurse that he took it and let me go without. Beyond stealing my food, he paid no attention to me, and as I was delirious our Consul, Anthony Sprague, of Massachusetts, when he called found me covered with dust, rolling about the floor and killing things all over the walls. He immediately took me to the civil hospital, where I remained in clover for seven months. He told the British authorities what he had discovered in their hospital, and as soon as I was well enough to sit up I had a visit from the Governor, Sir Charles Napier.

His aide-de-camp, a haughty fellow, with an eyeglass, accompanied him.

Sir Charles asked me if it was true that the military hospital was in as bad condition as our Consul reported.

"Yes, sir," said I.

"Say 'Yes, your lordship,'" said the aide, fiercely. I paid no attention to him till he repeated it, and then I said:

"I call the President of the United States 'Sir,' and I have no higher title for any other man."

"Why don't you rise when you're spoken to?" he said.

"I don't rise because I can't," said I. "I'm too weak yet."

"He's one of those impertinent Yanks," said the aide, angrily.

Sir Charles, however, did not share the feelings of his subordinate, but pursued his inquiries very kindly. His daughter was with him, a pretty girl of eighteen years, and she noticed that I had my bed protected with a mosquito bar edged with pink ribbon. That took her eye immediately, and she said:

"How much better that is, father."

He agreed with her, and so all the beds in the ward were fixed like mine. Of course, the condition of the military hospital was none of our business, and our Consul's report to the British was informal, and made in pure friendliness. The result was a general cleaning up that did much good.

I never in my life had a better time than when I was recovering in that hospital. As soon as I was able to eat Mr. Sprague called on me and asked if I could eat anything. When I said that I could he sent in a grand feast, and after that he and his daughters and Sir Charles Napier fairly kept me loaded with delicacies. On the Fourth of July they sent me a cake three feet high. I was too sick to notice it at the time, but it was the first thing I saw when I became conscious. It had an American flag on top of it. I had so much given me that I was able to supply all the patients in our ward. The Consul called twice a day, and his daughters also called very frequently. He sent his carriage every day to take me out driving, and if ever a sailor was petted I was.

I got up a football team among the patients as soon as I was able to run about, and we broke every gas lamp in the courtyard, but if any one asked who had done the mischief the answer always was "the Yankee."

That made it all right.

At the end of seven months in this snug harbor along came the "Nipsic," and I went back to duty. She took me to New York, where I was paid off, honorably discharged, having served my time of enlistment. I received \$850, the accumulations of three years, and started ashore, but met Lieutenant Schumaker

in the navy yard. I had known and served under him as a midshipman.

"Going aboard ship?" he asked.

"No, sir; I'm going ashore. I've just served my time."

"Better come with us on the 'Brooklyn.' We have a place for you."

But I hadn't been in the United States for three years, and he couldn't persuade me then.

Out into Brooklyn I went, and had my fling for three days and nights, spending \$150 seeing the sights and treating my friends. I took a run up to Boston and down to Baltimore, but did not go to my old home in Virginia. My father and mother were long dead, and my family had scattered. I have never visited that place since I left it.

At the end of the third day I had enough of the shore, and I dressed myself in my sailor clothes, and put all my landsman's togs in a valise.

"I'm going to sea again. What'll I do with these?" I asked McKelvey, who keeps the hotel in York Street, Brooklyn, where I was stopping.

"Leave them here till you come again; they'll be all right," said he.

"I won't be back for three years at least," said I. "I'm going to give them away."

I stood on the street till a seedy looking fellow came along.

"Here," said I, "take this."

He backed away as if he thought I had dynamite in it. I followed him up.

"Take it," I said. "It's all right. It belongs to me, and I'm giving it to you. There's a new suit of clothes in it."

He took it very doubtfully, but when I opened it and showed him the new suit with the neckties, collars, shirts and all the other things he grinned clear across and trotted away. People looked at me as if they thought I was drunk.

Down to the "Brooklyn" I went (the old "Brooklyn," a square rigged frigate), and a little later we were off to China, through Suez. This was in July, 1886. We went into the Persian Gulf, and lingered there some time, visiting a city at which no American ship had touched for twenty years. We got a telegram telling us to hurry along to China, and the next place we hit was Bombay.

Here a party of us got shore leave and did the city, having a pretty good time.

Our sailors have their best times in ports of North America, England or North Europe. They don't get along so well in South Europe or South America or Asiatic or African ports. There's plenty of society and it is cheap there, but not nice.

Jack is supposed to be a rough brute, but he has his ideals. The American sailor simply can't associate comfortably with Kanakas, Indians, negroes, Spaniards, Portuguese, Chinese or even Japanese. Their ways are not our ways. They're coarse, that's what's the matter. We get enough of that in our business and don't want it in our pleasure.

So we only had a moderately good time ashore at Bombay. We rambled about the place, had dinner at a tavern, saw the public buildings, and in the night went to the famous Tower of Silence, where the Parsees place their dead.

We paid about thirty rupees in bribes to be allowed to climb a ladder to the top of the tower and hold our noses. That tower gives the best reason for holding noses of any place I ever was in.

It was a rare privilege that we gained by bribery. No one is allowed on the tower—except as we go there. Travelers declare that no one except bearers of the dead go beyond the gate of the tower, but we did that night. We saw the whole thing and were very glad to get away from it again. The vultures are there in a mass.

We went from Bombay to Borneo and up the river through the domain of Rajah Brookes, the wonderful Englishman who carved out a new kingdom for his country among the Malays. We steamed up a beautiful river through the wildest of tropical scenery, with parrots and monkeys in the trees on either hand.

A little later we were cruising in the inland sea of Japan, having first touched at Yokohama and put ourselves in communication with our China fleet. By special permission we were allowed to land at many towns of Japan, from which the ships of foreigners were at that time generally excluded. We had a good time till we broke our crossheads, after which a Russian gunboat gave us a tow to Nagasaki. We met an English tramp

steamer that sold us some fresh provisions and then boasted in the papers about relieving our starvation. We had plenty of provisions, but not fresh, and we paid for those we got from the Englishman.

When the repairs were made we started for home, and at the end of the long cruise I was paid off again at the Brooklyn Navy Yard, receiving something like \$675. This time I was ashore thirteen days, cruising about, taking in Coney Island and the theater, treating my friends and visiting all the wonderful sights that I heard about.

When I was ready for sea again I shipped aboard Admiral Walker's flagship, the "Chicago," of the White Squadron. That was in July, 1889. We had Zogbaum, the artist, aboard making pictures of the new navy for *Harper's Magazine*. He used to come out with his camera and wearing rubber boots when we were holystoning, and to plague him we used to turn our backs. That was just fun, of course. He could get all the pictures he wanted.

I was six years aboard the "Chicago," and on the 19th of April, 1895, I was again paid off at the Brooklyn Navy Yard, and went for another cruise ashore. This trip I was twenty-two days on the land, but at the end of that period was driven back to what had become my true element, shipping this time on the "Maine" and going from that to the monitor "Amphitrite."

I entered a gun competition there and came out first gun captain. In 1898, when the Spanish War broke out, I was at Philadelphia aboard the "Miantonomah." My time was up, but the captain told me that if I would continue to serve he would get me a month's leave of absence with pay when we went North again. I was willing, and so we went to the war.

Nothing much happened. We patrolled outside of Havana harbor with a lot of other old ships (everything that could carry a gun was sent down there). Sometimes the forts fired at us, and once the "San Francisco" got a shell through her stern, but it didn't raise even ordinary excitement among us.

Once a steam launch bearing a flag of truce came out of the harbor and spoke

us, asking permission to take some sick people through our line to another part of the coast. Permission was given and the launch turned back.

A group of officers on the superstructure leaned over to hear what was said, but missed it, and a young lieutenant ran up to me and asked what the launch wanted.

"General Weyler sent the flag of truce to warn us that if we don't keep outside the three-mile limit he will fire on us," was my answer.

The young lieutenant eagerly ran back and communicated this valuable intelligence, whereupon all the other officers laughed at him. He repeated it and they laughed harder. Then he came back to me and asked what was wrong with the news. He didn't see even then.

"Why," I said, "don't you suppose Weyler will fire at us anyhow?"

"Oh, yes," said he, and went away, a wiser young man to that small extent.

Every ten days the "Miantonomah's" vacuum pump broke down and we had to go to Key West to fix her. And that's all I saw of the war. Nevertheless, I was a great war hero when I got North again. The people were wild about heroes and ready to worship any one in uniform.

We landed in Newport and the folks there came to worship us. One of their offerings was a grand clambake, which we had in a park there. After it was over, when I was strolling through the park, a man came up and told me that Mr. Bull wanted to see me. I asked what Mr. Bull he meant. I didn't know any Mr. Bull, except old John, who was not a personal friend. But I went to see.

It turned out to be Congressman Bull with a very jolly party.

"What will you have to drink?" was the first question.

"If you want fun with me," I said, "I must stay sober."

They had caught another sailor, and they plied us with questions about the ships, which we answered as well as we could.

We were with them for three hours and had a splendid time. All took supper together and then all went to the theater.

I was on board the "New York" when she was Admiral Sampson's flag-

ship. I wanted to go to Manila, and Captain Chadwick wouldn't let me leave; but soon afterward I was ordered to join the training school, and I have been breaking in landsmen ever since.

They are a fine class, the men we are getting now under the new regulations. Most of them are young Americans of high grade mentally and physically. They will take on any amount of polish. We have foreigners, too, in the navy, but they are not as good as the natives. They can be taught up to a certain point, and then they stop improving and stand still till they begin to go backward.

Some people think that the navy is a place for black sheep, and a few years ago it was not uncommon for a magistrate to pardon a man convicted of some crime on the condition that he would join the navy. That is not done now. We don't want rascals, thieves and toughs. Black sheep get in among us at times and then they get out again. We want to have things so aboard our ships that we can leave our ditty boxes open with money in them and find everything safe when we come again. There is little thieving. If anything is stolen on a ship the whole company is looking for the thief, and when he is found the punishment is severe. After court-martial he is imprisoned at hard labor for a term of years and also dishonorably discharged from the service. The same sort of thing happens to a deserter. Men dishonorably discharged lose all their pay; so the penalty is no trifle. Desertions generally happen among new men who have not got used to confinement aboard ship. They are fewer than they were when I first joined, but are still too numerous, as it comes very hard on a young man who has been in the habit of roving about the streets freely after his day's work was over to have to stay aboard ship for three months at a time. He can't see good reason for it, and I think that if the regulations were relaxed in case of new men it might have a good effect.

Ordinary offenses, such as breaking leave and neglect of duty, may be punished by confinement in the brig or by putting a man in irons. The severest sentence that can be inflicted without court-martial is double irons for fifteen days. The brig is the ship's prison and

is not such a bad place. Bread and water is the fare.

The liberty books of the ships show that a wonderful change has taken place in the habits of the men during the time I have served. In the old days the books showed that seventy-five per cent. of the men on shore leave returned to duty intoxicated; now not ten per cent. of them come back in that condition. More than 5,500 of our sailors and marines have taken a pledge not to touch intoxicating liquors during the time of their enlistment. The naval branch of the Y. M. C. A. in Brooklyn, for which Miss Helen Gould gave the magnificent building on Sands Street, has more than 1,200 members, and there are other branches in the principal ports. Such a fine place, filled with all sorts of apparatus for amusement and instruction, could not fail to influence the entire navy, and the men's appreciation of it is shown by the fact that sometimes as many as five thousand men make use of its privileges in the course of a day—non-members as well as members being admitted, tho the members have the advantage of a discount of 20 per cent. on all charges.

In our navy the very best of feeling prevails among the men and also between officers and men. There is no such thing as a "hell ship" in the navy, with drunken or brutal officers abusing their subordinates. Officers and men are both under law, and the law is enforced. I have seen officers strike men and I have seen them promptly court-martialed for it. If a man has any complaint to make he can always get a hearing from the captain of

a ship, and I have seen captains take the men's part even to the point of telling subordinate officers that they did not believe them.

Taken on the whole, the officers of our navy are usually the best friends the men have and will go to any trouble to help them along, lending them books and giving them special instruction. Our men have no fear of their officers, but a great deal of liking and respect for them.

It is not so in the other navies. On the way to Peking a Russian gun hauled by marines stuck in the mud. Along came an officer and began to knout the men. Our gun, hauled by our marines, stuck in the same place, and up came McCalla and put his own shoulder to the wheel. That shows the difference.

Now and then there is a nasty nagging officer, but he doesn't get on well. His brother officers make him understand that he is ungentlemanly, and the men have their own way of punishing him. They obey, but the work doesn't go well and he gets marked down for deficiency, and the captain overhauls him.

What the navy needs most now, to my mind, is more officers and more cooks. An officer can't drill seventy men and give proper instruction to each, yet that is what they are supposed to do. One cook for one hundred men, as they are apportioned now, is too few, and the result is often seen in poor rations. The food is excellent, but much is spoiled in the cooking.

We hope to have the finest ships in the world in a few years, and we certainly have the finest men in the world already.

NEW YORK, MAY.

Nocturn

By Margaret Bartlett Cable

At the waking of the morn,
When madrigals are born,
Wake, heart of mine, leap up and sing—
Sing the silent bliss of night,
And the strength that comes with light;
Through hours of toil let song upspring!

At the drowsing of the day,
When sounds the vesper lay,
Breathe, heart of mine, a soft refrain—
Thanks for day with labor blest,
Praise for twilight's gift of rest;
Till listening stars catch up the strain!

NORTHAMPTON, MASS.

The Sympathetic Strike

By Ethelbert Stewart

SPECIAL AGENT OF THE UNITED STATES DEPARTMENT OF LABOR

IN the clashing interests of organized labor and organized employers the central point of attack and defense just now is the sympathetic strike. Employers, through their own associations and individually, generally concede recognition to the more powerful trade unions and enter into agreements with them. The point now sought to be gained is to prevent, by these agreements, the strong union which must be treated with from helping the weaker ones. From the shiboleth "We will treat with our men only as individuals," has come the next step, "We will treat with each union by itself." Considerable progress has been made by the associated forces of employers, and the retreat of the unionists from the Sympathetic Strike citadel has not been precipitous, but, nevertheless, a retreat. As if recovering from the attack, the retreating unions shifted their forces to a new position on the same battlefield and made a stand for sympathetic arbitration. This pleases the employer generals no better than the other, and the battle is now on. Victories are reported on both sides. The International Typographical Union, at its Cincinnati Convention in August, 1902, repealed section "142" of its General Laws at what amounted to an "Unconditional Surrender" order from the American Newspaper Publishers' Association. Section "142" was as follows:

"All contracts or agreements entered into by unions affiliated with the International Typographical Union shall contain a proviso to the effect that such contract shall be null and void in case of strike or lockout of any affiliated union occurring after all efforts of arbitration have failed through the fault of the employer."

At its last convention the American Newspaper Association prohibited its members from signing an agreement with the Union embodying section "142" or any phase of it. Its Commissioner, Mr. Driscoll, appeared before the Typographical Union Convention in Cincinnati, August, 1902, and with offers of

five-year contracts, and a speech in which he showed them how silly it was for intelligent, high-priced men to be sympathetic, carried his point. The printers exchanged section "142" for good contracts for themselves. Mr. Driscoll wisely refrained from quoting the words of the Chief of Locomotive Engineers in 1886, words which shocked the labor world from center to circumference, "What has a four dollar a day man got in common with a dollar a day man?" but his (Mr. Driscoll's) address was, in fact, an elaboration throughout of the same proposition. President Lynch, of the International Typographical Union, in his annual report, practically advised the repeal of section "142," in order to secure the long time agreements, at the same time dropping some hints as to the probable cause of the fight against the section. However, Mr. Lynch, in another part of his report, shows the folly of the ultra "autonomy" doctrine, which confines trade union membership strictly to one sharply defined trade in an industry, and opened the way to broadening the doors of the Typographical Union. The repeal of section "142," forced by the Employers' Association, will result in industrializing the International Typographical Union, probably, as it is believed to contain too many men who will not be "Locomotive Engineerized," to permit of its becoming a labor oligarchy. In its contracts with the Typothetæ, or Association of Employers other than daily newspaper publishers, this union still maintains its sympathetic arbitration clause. In its Chicago contract this clause is as follows:

"Any employer signing this agreement having altercations with the Mailers' Union, the Photo-Engravers' Union, the Stereotypers' Union, the Newspaper Writers' Union, or the Typefounders' Union, also agrees to refer such altercations to arbitration in the same manner as if the altercation was with a member of Typographical Union No. 16."

The Iron Moulders' Union of North America, at its Toronto Convention in

July, 1902, had to face this same question of sympathetic strikes, and in receding from it in the form of a strike fell back upon the same position of sympathetic arbitration which has heretofore been held by the printers. It adopted the following resolution, which it made a part of its constitution:

"Whereas, While we firmly believe in a complete solidarity of all labor interests; and

"Whereas, We realize that in no trade can so much be accomplished by a thorough unity of action as among those directly connected with the foundry; therefore be it

"Resolved, That it shall be the policy of this organization to render all possible assistance to our sister organizations when in trouble, provided they shall first submit their grievances and request our assistance before entering into a struggle with their employers; and be it further

"Resolved, That upon the receipt of a request for aid that might involve our members in a strike it shall be the duty of the Local Union or Conference Board to whom such request is made to at once take action thereon and submit the same to our President and Executive Board for their consideration; and be it further

"Resolved, That our members shall be bound to abide by the decision of our President and Executive Board, the same as provided in our Constitution in the case of a grievance of our own members."

This is the present attitude of the Iron Moulders.

Much is said in the newspapers about the attitude of President Keefe, of the Longshoreman's Union, toward sympathetic strikes, as shown in his recent report to his union. Inasmuch as the Longshoremen's is an industrial organization, including in its membership every occupation involved, from captains of tugboats to ore-dock laborers, it certainly need not concern itself about sympathetic strikes. Besides, in many of its agreements, it specifically stipulates that a strike to enforce article 16 of its constitution is not a violation of the agreement, and that said section shall not be a subject of arbitration. Now article 16 is as follows:

"SECTION 1. Whenever any vessel or barge loads or unloads with non-union men, then it shall be the duty of the Local where such vessel is destined to enforce extra charge of ten cents per hour for unloading lumber, and five cents per thousand for unloading lumber, two

cents per ton for unloading iron ore and coal, twenty-five cents per thousand bushels for elevating or trimming grain, two cents per ton for trimming ore and coal; and for boats which do not trim, two cents per ton extra for unloading. Provided, further, that boats loading or unloading lumber shall be punished by enforcing grain, coal or ore rates; and those loading ore, coal or grain shall be punished by enforcing lumber rates; and where boats after being fined still refuse to employ union labor at their ports where loaded or unloaded, the Locals in ports for which said boats are destined are requested to double the fine for each succeeding offense, and it shall be the duty of the Local to notify the aggrieved Local and the General Secretary-Treasurer that the said fine has been enforced."

A tolerably effective form of sympathy which may well render this organization fairly indifferent to sympathetic strikes. It is said that this section, and its systematic enforcement, changed a Senator's mind as to the "ignorant working-man," and convinced him that here was ability that must be recognized.

Before the Miners' organization took its present industrial form the operators strenuously objected to sympathetic strikes on the part of the miners' local unions, to help the mule-drivers, the cagemen, blacksmiths, etc. employed about the mines. This opposition forced the abandonment of the several distinct trade unions in this industry, and the grouping of all employed in the business into one union. The Miners' Union now controls everything, excepting hoisting engineers, in the coal business. In New York City the fight against sympathetic strikes in the building trades has so far resulted in a provision for sympathetic arbitration, this being embodied in section 2 of the final plan, as follows:

"2. Where an agreement exists between employers and employees all disputes in relation thereto shall be settled by a Board of Arbitration with an umpire if necessary. The decision of said Board or umpire shall be final. Should either side to the dispute fail to select an umpire, or fail to abide by the decision of the umpire, the dispute in question shall be referred to the General Board of Arbitration within 24 hours after such failure or refusal. The question of sympathetic strikes, or lock-outs, and all questions as to the jurisdiction of trades, must be referred to the General Board of Arbitration, it being agreed and understood that such kinds of work as have been heretofore recognized as being in the posses-

sion of a trade are not subjects for arbitration."

The attempt of the Contractors' Association to rule out the hod carriers and building laborers will, if successful, result in what will be in effect an industrial organization in the building trades in New York. If, for instance, assistance can be given the hod carriers only after the scale for the more skilled unions is signed, then the skilled unions will insist on all scales coming up at once; the demands will have to be conceded in gross, or all the unions will fight for all the scales. When the forty-three unions in the building trades are thus forced to act as one to protect all, they will soon drop trade-union lines and become a building trades organization, including the hod carriers and laborers.

This is what the employers are bringing on themselves as a result of their fight on sympathetic strikes. This is what occurred when the various brewery unions were driven back from sympathetic action.

The public has been somewhat misled in forming its opinion on this subject by the deceptive advertising methods of one side: The movement of Social Evolution is to lift the bottom up. It is only as trade unions do this that society or social

progress has any interest in them. It is only as they do this that they are helpful to society. Oligarchies, like some of the railroad organizations, have no social significance. They better themselves, not the world. Destroy the power of the strong to help the weak in trades unionism and its usefulness as a social force is gone. Whenever a man or body decides by an agreement to henceforth have no sympathy for another man or body of men, he not only isolates but insulates himself from the current of forces that propel. He is no longer a man among men. Socially he has ceased to exist. The labor oligarchies that have been rendered absolutely unsympathetic by their own selfishness and by contract have long since ceased to be reckoned a part of the industrial organization of the country. In the long run the employers will gain nothing; they will either force the trade unions to reorganize along industrial lines, or force them into oligarchies which will provoke the birth of other organizations to supplant them, and the fight will have to be made over again.

Walt Whitman says: "Whoso goes a furlong without sympathy, walks to his own funeral dressed in a shroud." This is as true of a trade union, big or little, as it is of a man.

WASHINGTON, D. C.

For the Freedom of the Theater

By James A. Waldron

MANAGING EDITOR OF THE *New York Dramatic Mirror*

THE theater presents an air of prosperity. In New York, where there are dozens of places devoted to dramatic and kindred amusements of various sorts, there is a blazonry of superficial signs that suggests at least the monetary success of the persons engaged in this form of public catering, and to the average person the average entertainment offered seems to be sufficient. Yet it cannot be denied that from the viewpoint of the judicious—a minority seemingly of lit-

tle immediate influence as distinguished from the mob, and yet a body of ultimate authority because it determines art standards and finally enforces them—the stage has fallen from its former estate of dignity and is largely given over to the inartistic and the vulgar. The enlightened among those that enjoy the theater for years have found little to their liking in the theater, and now find little in it that attracts them. Moreover, the enlightened nowadays seldom enter a theater

unless assured beforehand that their intelligence will not be assailed or their sensibilities shocked by one or another play heralded as "popular." Joseph Jefferson, who retains undiminished his ability to please, altho he continues in time-worn pieces; Richard Mansfield, whose artistic aims always promise something of value even if his personal achievement may not satisfy at times; Mrs. Fiske, the most subtly artistic and admirably ambitious of American women players—these and but a few others may be depended upon to offer something worth while to the rational playgoer. Much of the rest that comes under the head of amusement in the theatre has little to commend it, while it has much that is open to criticism for insincerity, superficiality, vulgarity, and even worse.

Of course, New York is a great metropolis, with transient tens of thousands who, in a great measure, support the more flashy lines of theater offerings that after their periods here are sent out to the other cities of the country labeled as "great New York successes," and there really is no legitimate stamp of New York approval upon many of the pieces thus exploited; but the craze of commercial management to cater to the floating population of New York that usually relaxes its morals when here, and indulges in amusements that it would not patronize at home, is not so astonishing as is the idea of commercial management that the general public of the country is represented in taste as to the theater by the relaxing transients in New York. This managerial error is but one of many that have followed the commercializing of the theater, to the theater's almost utter demoralization.

Some seven years ago the Theater Trust, otherwise known as the Theatrical Syndicate, was formed. Its alleged purpose was to simplify and systematize the business side of the theater of this country. The theater from time out of memory had been noted for the laxity of its business direction, but also always the theater had prospered in a business way, taking one period with another, practically in the measure of its wholesome and artistic dem-

onstrations; for it is an institution in which the artistic should control, or at least in the conduct of which the money idea should be dominated by the art idea. The more glorious history of the stage proves this, for in that history the records of artistic achievement are writ large, while there is nothing of moment recorded about mere "managers," who, in the best aspect of the theater, belong to the background. And beyond this the history of the theater shows that only artistic and wholesome drama survives. The meretricious or the erotic, even when it is brilliant, perishes except as an aberrant phase of literature. The theater has no continuous use for it.

It cannot be denied that the Syndicate performed what it set out to do in the matter of "simplifying" the business side of the stage. From all appearances, however, the members of the Syndicate have been the only gainers by the operation. Those of them that were rich before are now very rich, and at least two of them that began in very modest pecuniary circumstances now are millionaires, as their recent open investments in theater property show. The results of Syndicate rule to the theater as an institution, and upon the legitimate profession of the theater, have been deplorable.

The Syndicate had practically effected its combination and secured its hold before those most naturally and legitimately concerned in the theater had any suspicion of the scope and meaning of the movement. It had secured for its purpose, by agreement and contracts with the managers and owners of theaters, what amounted to absolute control of the larger number of the first-class houses throughout the country, that control in several large cities being comprehensive; and this had been accomplished without the necessity, usual in most big transactions involving valuable property, of "putting up money." In other words, the Syndicate in the beginning secured the handling for its own purposes of property representing millions—from which it has profited enormously—without originally investing much, if it invested any, money of its own. Of course, that

such a thing was possible implies a reflection upon the intelligence of other persons who really owned or managed the theaters. How it was possible will be explained.

The Syndicate is composed of six persons: Al. Hayman and Charles Frohman, Marc Klaw and Abraham Erlanger, and Nixon and Zimmerman, who originally represented, and still compose, three distinct business firms. These firms formerly were in sympathy in many things relating to theater traffic, and they still exist for subsidiary purposes, while their members together compose the Syndicate. Years before the Syndicate was formed Hayman had organized and been the chief figure in a theater monopoly on the Pacific Coast, whose operations were denounced by the press of that section and demoralized its stage for a long period. Hayman came East, and with Frohman and others has partnerships in theaters and various enterprises that relate to the operations of the Syndicate. Frohman is known as the most active and enterprising *entrepreneur* in this country. He controls a majority of the better theaters in New York, and is the great reproducer of foreign plays, the market for which he controls. His many enterprises at the inception of the Syndicate made him the most valuable individual asset of the combination, for to represent to managers throughout the country that in certain circumstances they might have for their theaters his many "attractions," while in other circumstances they could not, meant a great deal. Nixon and Zimmerman were taken into the combination because they controlled the desirable theaters in Philadelphia, Baltimore and Washington—cities necessary to the Syndicate scheme. The most important of the three firms at first, however, and the most aggressive and powerful to-day, was and is that of Klaw and Erlanger. Before the organization of the Syndicate this firm had managed to form a little monopoly of the better theaters of the South, reaching to New Orleans, in connection with a general theatrical and "booking" agency that they conducted in New York. This booking agency, a middle institution

between traveling enterprises, stars and combinations, so-called, on the one hand, and lessees and managers of theaters throughout the country on the other hand—aside from its restricted usefulness as it related to the Southern monopoly of its managers—served at once as the nucleus and the organizing mechanism of the Syndicate.

This booking agency, while serving the purposes of its owners, who then in a comparatively small way also were themselves exploiters of "attractions," had served other managers of attractions and managers of theaters in the manner of a middleman. It was easy, therefore, for those who operated it to suggest to the managers of all theaters desired by the Syndicate—the formation of which still was a secret—that it should be permitted, for certain fees or percentages, to "book" all the attractions needed by those theaters for a term of years. The average theater manager thus approached with a proposition, acceptance of which would relieve him of all the care and trouble incidental to booking his season and being assured a "good line of attractions," perhaps naturally fell into an agreement the ultimate results of which gave him no concern. He did not realize that by this arrangement he was relinquishing control of his theater to the point that left him really with no more authority than a mere janitor of his premises would have, or that he was lending himself to a combination that eventually would hold the better theater interests of the country for years as in a vise. Of course, there were managers of the better sort that had taken pride in their management, and in a knowledge of dramatic affairs that enabled them to pick and choose from the field of attractions those they believed to be best suited to their public. This class of managers naturally demurred to the plan that would leave them as mere figureheads; but it is said that the booking agents, by claiming that they controlled all desirable attractions, convinced the managers that unless they fell into the plan they would find it impossible to conduct their theaters. At this stage of the game the Syndicate really did not

control the necessary attractions so absolutely as they claimed they did; but having secured control of the theaters, which were necessary to the attractions, they appear to have quickly brought into submission those actors and managers of combinations that were inclined to balk. The scheme went through. Its success illustrated the business indolence of the average owner or manager of a theater and the cowardice of many players of note whose only legitimate excuse for permitting themselves to be used may relate to the fact that the business sense and the artistic temperament seldom are found in union.

Thus the Syndicate almost at once secured control of and laid under tribute the better activities of the theater. It was much as tho six travelers on a common highway should assume to dictate to and collect toll from all who might fare, after erecting a barrier. The managers of theaters have suffered less from the combination than have the artists, altho all have felt the grasp of an exacting master. Of course, theater managers are more directly related to the dominant idea of money that actuates the Syndicate. When the artistic side of the theater realized what had been accomplished by the Syndicate, however, the bolder among the players united in a chorus of alarm and protest. The chain began to gall at once. But it proved to be a verbal demonstration only. "When the Trust was formed," said the venerable Joseph Jefferson, some time after the first excitement, "I gave my opinion as against it, considering it inimical to the theatrical profession. I think so still." Richard Mansfield said: "Art must be free. I consider the Trust or Syndicate a standing menace to art. Its existence is an outrage and unbearable." Mr. Mansfield went so far as to speak in this strain to audiences in theaters managed by members of the Syndicate, so violent was he at first in his denunciation. But he later concluded that he would have to bear it, altho if he and half a dozen others of the more prominent actors who foresaw the inevitable evils of the Syndicate had bravely stood

out and fought it, they would have won and dissolved it. The late James A. Herne said of the combination: "Its effect will be to degrade the art of acting, to lower the standard of the drama, and to nullify the influences of the theater." And this was true prophecy. The better class of theater managers condemned the combination, altho being in its power some of them did not talk for publication. Augustin Daly, who held himself aloof, said: "I do not believe that the best interests of the dramatic art or the highest aims of the theater will be served if the spirit of competition is chilled, curbed or destroyed. The first aim of all such combinations or syndicates must be to absorb opposition and kill off rivals." And in truth that is just what the Syndicate, among other things, has been busying itself about.

Assured of a practical control of the theater, the Syndicate proceeded to administer the "business" with a view to securing the best money results for its own combination. Art, as it had related to the theater, fell into subordination to the merchant idea. Individual effort and enterprise, which implies the exercise of a variety of ideas and a healthful friction of intelligences necessary to any institution in which art is a factor, was gradually eliminated, unless it could be brought directly into a position contributory to the enrichment of the Syndicate or to some of the persons who now hold the theater as an institution to be worked for their exclusive benefit. The Syndicate exploited its own ideas to the exclusion of all others whenever and wherever possible, and its own notions naturally were restricted to a strengthening of its hold.

In its traffic with the theaters that it booked the Syndicate, through its booking agency, exacted large fees, in many cases five per cent., of the gross receipts from week to week. This payment was inevitable, whether the theaters realized any profit or not, and the work set against these fees was of no relative importance, as it might be done by a clerk. And the booking agency also in many cases exacted from the stars and combinations that it booked

with the theaters other fees not at all contingent upon the profits of the stars and combinations. In a word, the scheme was to insure large returns to the Syndicate and its agents from the businesses and properties and enterprises of other persons without any care as to whether the other persons made or lost money.

This was not the worst. While the Syndicate agents booked scores of attractions they also booked their own attractions, which naturally they favored in every way possible, in giving them the better "dates" in the better theaters, etc. In free circumstances the attractions that the Syndicate agents booked, and that were the enterprises of persons not in the Syndicate, would be in competition with the Syndicate's own attractions. The conditions may better be understood, perhaps, when it is said that not only were the fortunes of the attractions of outside persons to a considerable extent in the hands of the Syndicate by this means, but also that the Syndicate was enabled by its hold on the theaters to acquaint itself with all of the details of the inner business of the outsiders' attractions—details that in all enterprises of a competitive nature are necessarily kept secret—while the inner details of its own ventures were kept to itself. By this means it could enjoy advantages not necessary to explain. It was found, too, before the Syndicate had long been in operation that it was possible in some cases for the Syndicate to put a competitor out of business. One of the easiest of several methods at its command was so to arrange a tour that more money would be spent in railroad fares than it would be possible to take in at the door. Another means was to book a tour of theaters that could not yield a profit. Perhaps the most arbitrary—and certainly the most expeditious—way was to refuse point blank to book any tour. Formerly the managers of traveling theater enterprises made up their routes long ahead, and knew before the beginning of a season just what territory they had to cover. It is not necessary to dilate upon the advantages of such

anticipation. One of the alleged conveniences announced by the Syndicate under its system was that it could book an enterprise in a few minutes for a season, whereas it formerly took managers individually weeks to perfect their routes. But the Syndicate claim of quickness, it soon was learned, was not the only feature of its method. Many companies booked by it have not known their routes two weeks in advance on their tours, and have thus suffered many disadvantages. By keeping routes secret the booking agents had it in their power to manipulate matters to their own advantage and for Syndicate purposes, and to punish persons against whom spite might arise "in the course of business." The power of the booking agency over most enterprises has been supreme.

It is not to be wondered at that the Syndicate and its agents have waxed rich and strong, or that the ventures of "outsiders" have steadily grown fewer in number. As the ventures of outsiders have grown fewer, the enterprises of the Syndicate and its several individual firms have increased in number until it has seemed but a question of a few more seasons before the Syndicate would literally own and provide the theater of the country. Its members already promote and own, either openly or covertly, it is said, a majority of the attractions that fill the better theaters of the country. It can be stated, however, that their enterprises usually betray their origin. In the dramatic field the tendency of the Syndicate idea is to multiply attractions of mediocre merit. Let a player's head show a little above his fellow's, and soon he will be "starred." It is only necessary for the Syndicate to see a small talent to lead it to attempt to impose the small talent upon the public as a great talent. Flamboyant advertising and flashy surroundings are relied upon to cover up defects of merit. Aside from its exploitation of mediocrity in drama and the importations of Charles Frohman, some of which have been good and others vile, the Syndicate frequently plunges extravagantly on shows of women in flush numbers and in gaudy and vulgar combinations

and surroundings. The word "show," in fact, may be said to have been blown in the Syndicate glass. No member of the Syndicate in conversation has been reported to designate or describe any theater entertainment, whether his own or another's, or whether a Shakespeare play or a farce comedy, as anything but a "show." And even to the casual eye the stream of "amusements" for which the Syndicate is directly or relatively responsible reflects its source.

It should be understood that in its dealings with other persons concerned in the theater the Syndicate and its practical representatives have followed a characteristic policy aside from some of the details of its methods that have been suggested. At the outset it realized that the more prominent actors were absolutely necessary to its plan, and to them it paid much deference. Perhaps some of the more prominent actors at first took this as a legitimate tribute to their artistic worth. Actors respond more quickly to flattery than any other class of professional persons. But the conditions were not so agreeable to the great class of ordinary actors who were not so necessary to its plans, yet who were forced to do business with it or seek some other vocation.

For years there was no hope of an organized and effective opposition to the Syndicate by those who had the power to combat it in the interest of fair dealing in the business of the theater and of the sane and artistic on the stage. A single-handed and consistent effort by a woman—Mrs. Fiske—furthered by faithful and earnest management, to follow her purposes as an actress on lines absolutely independent of the Syndicate, was long the only practical protest against existing conditions. Mrs. Fiske fought alone for years for liberty, playing in undesirable theaters, because desirable theaters were shut to her by the Syndicate, but still playing successfully. She even won in the courts of Colorado in a case in which the Syndicate's agents had secured a second-class theater in Denver after she had booked in it—the Syndicate controlling all the first-class houses there—with

the purpose to prevent her from appearing at all in Denver on her way to San Francisco. The courageous example of this actress, with growing difficulties put in the way of managers and actors, inclined at last to dispute an arrogant combination, seemed finally to have inspired a concerted opposition on the part of a few, and accessions to the little band of independents have followed, until there is promise of ultimate freedom in the theater.

About a year ago Mr. James K. Hackett, an ambitious and enterprising actor-manager, and Mr. Maurice Campbell, the husband and manager of Henrietta Crosman, who had followed Mrs. Fiske in successfully defying the Syndicate, joined with Mr. Harrison Grey Fiske, manager of Mrs. Fiske and of the Manhattan Theater, and these three formed what they named "The Independent Booking Agency." Determined themselves to conduct their business on independent lines, these managers will next season have several enterprises of the better class in addition to those with which they now are identified. They concentrated their interests for convenience, but at the same time announced that their agency would be open to all persons in the theatrical field that desired to be free. A significant motto of this new agency was "No Fees," and as its methods were disclosed it gained new recruits. Among the first to come into the new agency and work hand in hand with Messrs. Fiske, Hackett and Campbell, were Messrs. Weber and Fields, who stand as the best types in their popular field of comedy, and who next season will have several differing theater enterprises of their own. It is said on the best of authority that next season the independent group of managers and actors will be joined by several notable figures, and that the following season—the delay being made necessary by existing contracts—several of the best known persons and organizations in the field of the theater will add to its strength.

The Syndicate had so intrenched itself that a mere combination of managers of attractions and actors, unless it assumed the proportions of an exodus

from Syndicate control, or unless those that comprised it were ready to undergo all sorts of hardships incident to playing in the poorer theaters, would have been in a measure ineffective for the common purpose of independence. Thus the first matter to which the Independent Booking Agency turned its attention was the securing of theaters in such number and of such class as would offer to recruits possibilities for long tours embracing leading cities. The headway made by the Agency in this matter during the first year of its existence has been remarkable. It already has assured two theaters in Manhattan, two in Boston and one each in Brooklyn, Cleveland, Detroit, St. Louis, Chicago, Pittsburg, Buffalo, Baltimore, Washington, Milwaukee, Louisville, Cincinnati, Philadelphia, Montreal, Kansas City and other places, in most of which it has heretofore been impossible for an independent attraction to play, owing to the control of the Syndi-

cate, besides scores of theaters in the minor cities. In several cities capital has come forward with such faith in the new movement that new theaters are promised. It is believed by many, from recent events in the theater field, that if it should be necessary, the Stair and Havlin Company, which long has operated popular-priced theaters in many cities, and which now owns and controls one hundred or more houses widely distributed, would throw open its doors to the new movement. It seems to be the policy of the Independents, however, to secure by their own means enough houses to insure absolute independence on lines of perfect freedom for all that may wish to join in the movement; and there would seem to be no doubt that the days of arbitrary control of the theater of this country for the benefit of the few and to the discouragement of high ideals are numbered.

NEW YORK CITY.

Characteristic Texts

By John Townsend Trowbridge

From Voltaire.

"JE fais le matin des projets,
Et le long du jour des sottises."

Thus ever, while the world revolves,
I plan the right, I do the wrong:
I make each morning wise resolves,
And act but follies all day long.

From Virgil.

"Tu ne cede malis."

Yield not, whatever woful stroke may be
Thy portion, when befalls the evil day;
But draw fresh courage from calamity,
And forward press, where Fortune points
the way.

From Goethe.

"Muth verloren, alles verloren."

He loses little who loses wealth,
He loses much who loses health;
Who loses courage, loses all.
O trembler, drawing fearful breath,
Guard well thy days, yet know that death
Is never the worst that can befall!

ARLINGTON, MASS.

LITERATURE

Another Edition of Shakespeare

THE Bowen-Merrill Company are publishing a new edition of Shakespeare, under the general supervision of Professor Dowden, two volumes of which lie before us.* They are attractively bound, of an admirable reading size, a thin octavo, with a good, clear text and legible footnotes.

At first sight it might seem as tho this edition in its eagerness to make a place for itself were in danger of falling between two stools, being too scholastic in plan for the general reader on the one hand and not thorough-going enough for the student on the other. Of the former danger the very existence of notes on words so familiar as *tush*, *pish* and *bookish* would appear to furnish an instance; of the latter, the comparative brevity of the note on *Othello* I, i. 21, "damned in a fair wife," to which Furness devotes five quarto pages of close print. For after all a book must direct itself to one sort of public or another; it cannot oscillate between several. One of the "features" of the edition is the introduction of textual variants, thereby increasing its already rather conflicting functions by that of a *variorum*. The notes, which are at the foot of the page, as they should be in a reading edition, are yet in many cases so swollen beyond the mere reader's needs as to encroach upon the text and crowd it into a narrow and inconvenient strip of type on the very confines of the page. Nor while we are on the subject can we refrain from exclaiming at the kind of note which simply vulgarizes the text by translating it into the literal and commonplace. So on *Othello* I, i. 124: "At this odd-even and dull watch of the night,"

it is explained that dull "has here the sense of dead, lifeless. Compare, 'O sleep, lie dull upon her,' *Cymbeline* II, ii. 31." What an innovation for the

first edition that omits this variety of pedantry!

And yet for a kind of reader there is a great advantage in getting so much in so small a compass. For even tho the notes may fall short of scholarly completeness in some instances, they do at least start almost every question of interest in connection with the play; they arouse an intelligent curiosity and keep in the reader's eye matters which, while their importance may be easily exaggerated, yet should, we think, be always carried in consciousness during the reading of Shakespeare—the condition and authority of the text, Elizabethan usage, Shakespearean idiosyncrasies, and the like—matters of which, it must be confessed, the general reader, flattered by complaisant editors, is as a rule deplorably ignorant.

In an edition of this kind, then, which virtually pretends to introduce the general reader to the serious perusal of Shakespeare, a good deal will depend upon the editor's trustworthiness. Now in every play there are a certain small number of *cruces*, from a commentator's manner of dealing with which it is possible to form a pretty shrewd estimate of his editorial capacity and temper. In *Othello*, since we may safely let Professor Dowden's volume take care of itself for the present, one of the most disconcerting of these stumbling blocks occurs in the use of "defunct," I, iii. 265. Here Mr. Hart deserts the usual text, that of the Cambridge edition, which he ordinarily follows, "in me defunct," and restores "my" from the first folio—in our opinion rightly. His note on the passage is ingenious and as satisfactory as anything heretofore; tho it seems odd to us that no one, so far as we know, has ever suggested that "defunct" has here the meaning of accomplished, complete (*defungi*), which agrees with the context and with the folio, and does make sense. With equal judgment Mr. Hart has restored the folio readings in several other disputed passages; II, iii. 328; III, iii. 124;

* THE DOWDEN SHAKESPEARE. *Othello*, edited by H. C. Hart. *Cymbeline*, edited by Edward Dowden. Indianapolis; The Bowen-Merrill Co. \$1.25 each.

IV, ii. 65. In fact, his devotion throughout this play to the folio is to us not the least of his recommendations.

But there is in the play another and even sterner test of an editor's character. Incredible as it seems when one's attention is first drawn to the matter, the action of the drama, whatever the ideal effect may be, allows only thirty-six hours after the landing in Cyprus—virtually thirty-six hours after his marriage—for the growth and culmination of Othello's jealousy—an interval seen to be utterly inadequate to its results when the motive of Desdemona's murder is remembered. On this point, which has called forth some of the most tormented reasoning ever written, Mr. Hart expresses himself in the following simple fashion—and the remark is characteristic of the sense and moderation with which he as a general thing treats his difficult passages:

"Probably Shakespeare troubled himself little about the question. It satisfied him that he produced a work unequaled in power, whether for the stage or the study. How many careful readers do actually find the time question a stumbling block, unless they are called upon to worry over it? And to what extent does it produce any incongruity in the action? . . . I cannot bring myself to attach the apparently requisite importance to this department of *Othello* criticism; or to regard it indeed as much more than an intricate and highly instructive intellectual puzzle, to which there is probably no satisfactory solution. The fact seems to be that Shakespeare follows, on the one hand, the time occupied by the telling of the original story to the end, where he closes up its dilated conclusions into one grand climax, entirely his own conception. On the other hand, it is needful that these be compressed into a 'more continue time,' for the purposes of action; a necessity that none had better practical dramatic knowledge to enable him to carry out than Shakespeare."

This may be said to be Richard Grant White's line; but how good a one whosever it is! Shakespeare had to produce a piece which should give realistically an impression of long drawn development; but idealistically, both in passion and structure, an impression of rapidity and compression. He succeeds in giving both. How long will it be before critics and commenta-

tors learn that literature is not to be judged by anatomical cross sections?

Why the Mind Has a Body

THIS book* deals with those perennial questions which every soul must sometimes struggle with, whether it solves them or not, and which haunt even those who resolutely turn away from them. It deals with them with fairness, with profound comprehension and with a lucidity which, in view of the closeness of the reasoning, is remarkable. The disgust with metaphysics felt or professed by most people is due in great part not to the subject, but to its treatment. So much has been written badly, diffusely and confusedly that the world has been wearied. But the world will never weary of clear, concise reasoning, of keen criticism based on adequate knowledge; and, however it may be with individuals, the race will never weary of asking what is matter and what is mind, and how are they related. These are the questions which Professor Strong proposes to answer, and which to a great extent he does answer.

The problem first discussed is the issue between interactionism and automatism. According to the interaction theory, in sensation the body acts on the mind; in volition the mind acts on the body. Automatism holds consciousness to be an accompaniment or function of the activity of the brain, on which it exerts no influence. Two theories belong here. Huxley and those of his school regard consciousness as an effect of brain action; others maintain what is now called parallelism, which means that consciousness and brain action flow along together, in a kind of Leibnizian "pre-established harmony," and have no causal connection. As Professor Strong says, the great question is not in which direction the causal influence runs, but whether the relation of mind and body is such as to permit of causal relations at all.

For, in deciding whether or not such causal relation exists, what are we to

* WHY THE MIND HAS A BODY. By C. A. Strong. New York: The Macmillan Co. \$2.50.

say of the universal validity of the principle of the conservation of energy? Is it, as Helmholtz said, "a universal law of all natural phenomena," or is it only an hypothesis, useful in dealing with certain classes of physical fact? And is not the tendency of some biologists to fall back from Darwin to Lamarck, and attribute to mind an influence on bodily evolution, significant of a general, if not final, drift of thought back to the position of Anaxagoras?

Again, if we reject causality in explaining the relations of the mind with the body, we are committed, if not to materialism, at least to a mechanical theory of the universe; "brain events, taken with other physical events, form a closed circle." And finally parallelism seems to involve the denial of the physical efficiency of mind, and automatism the denial of its general efficiency. That automatism really does involve this denial appears from the fact that causal inertness of mind is one of its cardinal principles. But parallelism denies physical efficiency only; and that efficiency of a different kind is conceivable is really the conclusion toward which the whole argument tends. The bearing of this on the question of free will and responsibility, and on ethical theory in general, is obvious.

Our limits preclude further analysis. We can only praise the admirable statements of the results of physiological psychology, and of the present status of psychological theory. The critical exposition of interactionism and automatism is as clear and concise as a geometrical demonstration, and while we may not call it unanswerable—knowing that answers will be made—the issues are so clean cut as to be practically decisive.

One point only will we dwell on. Evidently Hume's doctrine concerning causation must be overthrown if Professor Strong's metaphysical argument is to prevail. He admits that Hume was right in denying that we can perceive any "real tie" between cause and effect; even between mental states we perceive merely a phenomenal continuity. But he maintains that

Hume did not disprove the existence of a "rational connection" between cause and effect. Such a connection Professor Strong thinks established by the qualitative and quantitative relations between cause and effect disclosed by the progress of science. The great example of such demonstration is the modern doctrine of the correlation of forces, which enables us, to a certain extent at least, to "discover the effect in the cause," and to see why a certain effect should follow a known cause. From the existence of a "rational connection," it is not a long step to hold that the mind is a force, and exerts what is commonly called "power." With this fulcrum the enormous burden of metaphysics may be moved, and the way is open for a suggestion, if not a demonstration, of the mode in which mind may act on matter.

In the constructive part of his "Psycho-physical idealism" Professor Strong is more dogmatic, and therefore less satisfactory than in his critical exposition. That we have a "transcendent" kind of knowledge of the existence of other minds will, of course, be violently controverted, and the argument for the mentality of things-in-themselves will meet with equal opposition. But it is an advantage to have the distinctions between the different theories of phenomenalism and of idealism clearly brought out, and no one can deny that Professor Strong has conscientiously tried to state fully and fairly the views which he criticises adversely. He has given a fresh interest to metaphysical speculation, and his book will not only stimulate the curiosity of beginners in the study, but will aid philosophers in general by the completeness of its presentation of the different views now taken of the fundamental problem.

German Ambitions

UNDOUBTEDLY "Vigilans sed Æquus" intended this series of Letters,* now reprinted from the London *Spectator*, to

* GERMAN AMBITIONS. AS THEY AFFECT BRITAIN AND THE UNITED STATES OF AMERICA. By "Vigilans sed Æquus." New York: G. P. Putnam's Sons. \$1.00.

be a double warning, and the editor of the *Spectator*, who has warmly endorsed the letters and has written an introduction to the volume, apparently wishes that there should be no mistake in omitting this country from the possible operation of those alleged menacing conditions which German ambitions have created. We do not see, however, why the existing good will between the United States and Great Britain should require us to consider that the latter's enemies are necessarily our own; and therefore a *caveat* should be entered against the assumption under which the book is written. Upon this point the utterances of German publicists, professors and journalists should at least have an American, not a British, interpretation.

At first view the contents of the book disclose a seething mass of national envy, discontent and ambition which permeates German life, and whose force is directed primarily against Great Britain. The United States, it may be fairly said, ranks second in estimated obstructiveness to German ambition, and Russia third, because the last named, tho an ever present menace, is to some extent already provided against, while the former newly confronts Germany in trade ambition and colonial policy. The argument of "*Vigilans sed Æquus*" is based upon a class of writings thoroughly representative of the new German school of growth and racial expansion. The writers, it is pointed out, are not merely obscure Pan-Germans, but include university professors, "men who would speak under a full sense of responsibility to their hearers, and on whose consciousness is stamped the saying of Von Sybel: 'What the professors reasoned out, that Bismarck achieved.'" We have no space to repeat here even a few examples of the utterances taken from this mass of aggressive literature, which abounds in settled ill-will and meditated vengeance against Great Britain. We could fill two pages with lists of the writers and their books, and ten pages more with the quoted language of anti-British menace and contempt. There are, it is true, notable exceptions of good temper and fair-mindedness, such as Delbrück, Marcks and Arndt; but the rest of the forty odd writers quoted from are implacably hos-

tile to great Britain. The great majority of them join in condemning her policy as selfish, her trade methods as effete, her fleet as decaying in *personnel* and construction, and in declaring that her maritime supremacy is doomed.

With regard to the United States, the chief German objections cited are against the Monroe Doctrine, the inroads of American manufactures, the Dingley tariff, and the American control of the Caribbean Sea.

All this, of course, is perfectly legitimate matter of German objection against Great Britain and the United States. Germany has her own ambitions, and whatever nation they confront must have its ability to hold its own or be distanced in the race. Among these ambitions, or schemes, which the future, according to these writers, is to see realized are the formation of a Central European Zollverein to check the American trade invasion; the creation of a large fleet, which may be used either to humble Britain or eliminate the Monroe Doctrine; and the eventual occupation of a part of Brazil or some other fertile part of South America. We omit reference to the Pan-German cult in Europe, the question of Holland's absorption, of future German control of Constantinople, or the occupation of Asia Minor as a German colony. Even these would not exhaust the list of German ambitions as suggested by the writers referred to.

The value of this book as an exhibit of political evidence is considerable. That the opinions contained in that evidence represent the mass of intelligent German aspiration there can be no doubt. They contrast in a most instructive way the diplomatic amenities of the Government with the strong, popular impulse, little heeding amenities or compromise, which animates new Germany. Assuming that wars occur very often through national misunderstandings, it is in every way desirable that the sincere beliefs of a majority of Germans should be revealed. It is one of the aims of social philosophy, according to Victor Hugo, to dissolve angers by the study of antagonisms, and better material for such study could hardly be procured, so far as Germany is concerned. It is useless to enlarge upon the possible conse-

quences of the ambitions so impressively set forth in these letters. Much more to the best immediate purpose would be a similar exhibit of American or British popular aspiration, if such can be made, so that the German publicists and people can know more accurately the nature of the problems which confront the two Anglo-Saxon Powers. It would lessen the dangers of international friction and improve the prospects of peace all around.

Leo XIII

MONSIGNOR O'REILLY'S biography* of the late Pontiff may, we suppose, be regarded as, in a certain sense, official. The author tells us that he was summoned to the Vatican a few years ago and invited to undertake the task. Abundant and official documents were placed at his disposal, and he was even furnished with the personal memoirs of His Holiness. The result is that, instead of the outline sketches of Leo's career which have hitherto appeared, we have a full length and carefully elaborated portrait, drawn by an authorized hand, in which all the details in the background of the canvas are filled in scrupulously and with due attention to the historical perspective, so that no doubt the august model would have little difficulty in recognizing in the work before us the authentic image of his moral and intellectual physiognomy, his acts and government.

Reading such a book is like getting at the sources. But, then, sources are often interpreted differently, and altho Monsignor O'Reilly shows himself thoroughly familiar with the places, the men, the things, and even the secret of the things of which he speaks, he was perhaps in too close communion with the Head of his Church, too passionately sympathetic with every phase of his life, too deeply saturated with his thoughts, and too docile intellectually to be altogether impartial in his presentation of the Pope's sentiments and line of action on the complex situations with which he had to deal. The tone of panegyric is rather too pro-

nounced throughout, and the reader would have been pleased if the author had occasionally let the Pope's deeds speak for themselves. The book is written not only to make known the facts of a life that was almost commensurate with the last century, but to defend and eulogize every act of Leo in relation to the troubled century itself. There have been plenty of differences with regard to certain features of the Papal policy, even in the curia. Monsignor O'Reilly is silent on the subject, evidently holding firmly that all the acts of Leo, great and small, were guided by the special direction of Providence.

The great value, however, of this sumptuous and beautifully illustrated edition of 744 pages is that it will form a copious and valuable source of contemporary information for the future historians of one of the most fruitful and remarkable Pontificates in the annals of the Roman Catholic Church. Translations of all the important encyclicals are given, and these documents exhibit a wonderful grasp of the moral needs and dangers of modern society, besides proposing solutions for the questions that at present disturb the world.

Mr. Page's Novel

ANOTHER story* of Reconstruction days in the South, and a better one than "Red Rock," where there was too much of the sentimentality of misfortune, too frequent appeals to the reader's sympathy. But most of us are more gracious with our admiration than with our sympathy, and "Gordon Keith," the hero of this novel, compels admiration by showing sufficient energy and courage to overcome the difficulties of a situation rendered more or less tragic by the results of the Civil War. Indeed, the dramatic interest hinges upon his triumph over the commercial villainy of Northern capitalists, who were disposed to take a financial advantage of Southerners during this period of almost universal bankruptcy.

But the motive of the book is to prove a natural and social distinction between

* THE LIFE OF LEO XIII. By Monsignor Bernard O'Reilly. Philadelphia: The John C. Winston Company. \$2.50 net.

* GORDON KEITH. By Thomas Nelson Page. New York: Charles Scribner's Sons. \$1.50.

the thoroughbred Southerner and the Northern man supposed to belong to the same class. Thus having created a paragon of courage, virtue and energy in the person of his hero, Mr. Page thrusts him into the social life of New York, where prestige depends upon wealth rather than upon character or good breeding; and, page after page, he demonstrates the eternal difference between the young Southerner and his Northern companions. The youth's very tan and awkwardness are made to redound to his glory, and the fact that his courtesy and kindness actually bring him under suspicion is used by the author to prove that the Yankee had not at that time a conception of the gentleman which would enable him to recognize one by his manner.

But to convince the popular mind that there is an elemental difference between the Southerner of high degree and everybody else has always been Mr. Page's literary business. He labors under the delusion, peculiar to novelists of that section, that probably the only perfect gentleman in this world is the Southern man of more or less Virginia ancestry. This is a mistake, of course, and grows out of the extraordinary consciousness of superiority in all Southerners whose pedigree includes a number of colonels and governors. It is not so much a personal fallacy as it is an unbecoming insistence upon their precious distinction; and in the fiction of the South it is a quality that has been so accented as to become a sort of provincial absurdity.

Meanwhile, the New South, that is sweating and striving and learning to labor behind the scenes of this older civilization, has no interpreter in modern fiction. Apparently no one has the wit to see the dramatic interest involved in a situation where a whole generation of young aristocrats have been chastened in the fields and warehouses of the world into laborers. Mr. Page barely hints at it in this story, but his main theme is the old one of pedigree, pride and power. Now this old environment, these conditions and the men resulting from them are passing away, and the sooner Mr. Page, in common with other Southern writers, recognizes the fact that the romantic details of plantation monarchies and other features of the old South are

no longer interesting material, the sooner shall we have a representative literature of that section. Novelists in the North have long since passed from the gory annals of the Civil War to later and more vital phases of life, and it is time the South buried her dead and dealt more exclusively with her living heroes, lest the world should conclude there are none worthy of her past glories.

Felix

No one familiar with Mr. Hichens's previous work will take up the present volume* with any expectations of finding it to contain a *pleasant* story—a tale, that is, dealing with the smooth surfaces of existence whereon graceful and gallant figures glide easily, harmoniously and in happy accord, with nothing to remind us of the dark depths in the tide of life beneath. Mr. Hichens dives deep into the current with his men and women. So deep, in fact, that he stirs up considerable sediment in the process. It is, of course, open to debate whether such a course is, after all, either curative or tonic in effect. We all know that evil tendencies and debauching conditions exist to shame our civilization; that debasing influences operate and pestilential habits obtain in modern society, so that to own oneself worldly wise is equivalent to admitting, incidentally, a knowledge of a pretty revolting catalog of vices. But it is yet to be proven that the ventilation and open advertisement of such pent-in atmospheres tends toward a correction of them; to anything, in short, but a tainting of those concerned in the performance. "For," to quote our author against himself, "there are surely acts that cannot be done, for whatever cause, without leaving a stain upon the doer of them." But if Mr. Hichens wades into turbid depths he does not wallow in them. There are certainly repellent details in *Felix*, but they are not treated flippantly nor with any relish for the gruesome.

Felix, an English country-bred lad, just out of Rugby, full of the "long, long dreams" of youth, is sent by his widowed mother to Tours in France, in order there

* *FELIX.* By Robert Hichens. New York: Frederick A. Stokes Co. \$1.50.

to study the French language. With no experience, no preparation, he is brought abruptly into contact with Balzac, through such of his works as "*Les Illusions Perdues*" and the rest, which he eagerly devours. "How much a human being can learn from a series of books in the way of worldly wisdom" is subsequently proved. The boy returns to England full of his innocent and gigantic egoism, his mind sharpened into a sort of surgeon's scalpel with which he dissects every one and everything about him. His home he tickets dull, his mother narrow, his sister stupid and his brother-in-law insular and bigoted. To escape it all, to be free and unfettered in his search for the TRUTH—poor lad!—he goes to London. It is through the exceeding bitterness of his experience there, through contact with unexpected degradation in those he conceives most worthy of esteem and reverence, that he awakes at last, chastened and humbled, to a clearer perception of the eternal verities and his own real relation to them.

Mr. Hichens's work in this book is masterly. His people—men and women—even the pitiful little dog, Chico, and the world in which they move, are all vital things. And if anything could be said to do it, the end would seem to justify the means in this case, for nothing could be nobler, more deeply touching—almost Biblical in its stern simplicity and limitless significance—than this sharply disciplined prodigal son's return.

But the same old question persists. *A quoi bon?* Will the pitiless exhibition—the infecting excursion into miasmic regions—help?

The International Year Book. A compendium of the world's progress during the year 1902. New York: Dodd, Mead & Co.

There is no period on which it is so difficult to obtain information as that which is a few months past. Histories and cyclopedias are, at the best, several years old, and newspapers and magazines are usually destroyed as soon as read. To fill this gap between the current and historic such books as this are indispensable, and the *International Year*

Book is one of the best of its class. It is not only good for reference, but also for reading. From the articles on literature, drama and science one can obtain, as in no other way, a comprehensive survey of the activity of the world in those departments. There are some thirty full page illustrations and maps of Persia, Siam, Cape Colony, the Balkans and the Panama Canal site.

A Rambler's Notebooks at the English Lakes. Lake Country Sketches. By the Rev. H. D. Rawnsley, Honorary Canon of Carlisle. New York: The Macmillan Co., \$1.75.

The visitor to the Lake District will assuredly find his pleasure enhanced if he read these sketchbooks, introducing him to a delightfully old-time picturesque world, full of customs, ceremonies, legends, superstitions and interesting personalities. We read about the real John Peel, a typical character of the Lake District, whose inhabitants seem mostly to be "mighty hunters before the Lord," keen to the last, like the veteran herein described, who, trying to follow the finish of a hunt, exclaimed, in impatience with his fast failing eyesight: "Hang thur auld een o' mine! I wish that they wer nobbut out al' togidder; I believe I wad see better through t' hooals!" Very interesting are the reminiscences of Wordsworth gleaned from among the peasantry who had known him years before. As a poet he had little honor in his own country; indeed, the popular impression seemed to be that Hartley Coleridge, who has left more genial memories than the austerer poet, is responsible for Wordsworth's success in that capacity: he got most of "his potry out of Hartley;" "Hartley did t' best part o' his poems for him!" He is more cordially remembered as an expert skater; as one who had theories on the way chimneys should be built with due regard to the picturesque; and a natural guardian of the landscape, preventing trees from being cut down or rocks from being blown up unnecessarily. "Fwoaks began to tak his advice, ye kna, aboot trees, and plantin', and cuttin', and buildin' chimleys, and that mak o' things. He had his say at t' maist o' t' houses i' these parts, and was verra particler fond o' round chimleys." Would that every

community had a poet in its midst, "a vara practical-eyed man" like Wordsworth, with a "terr'ble girt deep voice" to make his admonitions heard! Canon Rawnsley is a worthy successor to Wordsworth and Southey as supporter of the best in Lakeside tradition.

Songs and Sonnets of Pierre de Ronsard. Selected and translated into English verse by Curtis Hidden Page. Boston: Houghton, Mifflin & Co., \$4.00 net.

The Introduction to this handsomely printed little volume is a clear and sympathetic account of Ronsard's life and of his place in French literature. The translations are excellent. They do not reproduce in English the effect of Ronsard's language, which for several reasons is an impossible task; but they do convert these old French poems into modern English poetry, and that without sacrificing a due literalness. The following sonnet tells a good deal at once about Ronsard and the skill of Ronsard's translator:

TO HIS VALET.

I want three days to read the Iliad through!
So, Corydon, close fast my chamber door.
If anything should bother me before
I've done, I swear you'll have somewhat to rue!

No! not the servant, nor your mate, nor you
Shall come to make the bed or clean the floor.

I must have three good quiet days—or four.
Then I'll make merry for a week or two.

Ah! but—if any one should come from HER,
Admit him quickly! Be no loiterer,
But come and make me brave for his receiving.

But no one else!—not friends or nearest kin!
Tho an Olympian God should seek me, leaving
His Heaven, shut fast the door! Don't let him in!

Love Letters of Margaret Fuller. New York: D. Appleton & Co., \$1.35.

All "letters" are apt to be, and the *Love Letters of Margaret Fuller* are particularly, like overhearing a conversation at a telephone. It takes as many persons to make a correspondence as it does to make a quarrel; and where the letters

are so very occasional as these, it is too bad that the party of the second part should not be allowed to give the clue to the numerous references and allusions with which this sort of writing is stuffed. And yet in spite of this drawback the present collection does serve to reveal a little more of a personality which, elusive enough at best, is, in default of any permanent production, fast becoming apocryphal. "She was infinitely less interested in literature than in life," Emerson says of her; and, indeed, there was a strain of indefinite experimentalism about all the "transcendentalists" of which she possessed even more than her share. It is this peculiarity, perhaps, as much as anything, which has made their actual accomplishment seem, with a few exceptions, so ludicrously small beside their aspirations and tinges their various activities with a shade of unreality, of make belief, as tho after all they were only playing with life. Avid of experience, they all seem, and she in particular, to have missed the reality of existence by their very eagerness, as a child is distracted by the variety of its desires from the enjoyment of the feast. "I wish, I long to be human, but divinely human," she writes. And it was very likely as another effort toward fulfillment that she spun the semi-serious romance for Mr. Nathan, which these letters commemorate, so factitious, so insubstantial does it all seem. The fact is, we are inclined to think that their isolated publication rather distorts the perspective in which they ought to be viewed. They were written during her period of protest, before she had learned to "accept the universe" and while her sense of relative values was still confused, so that the reader must beware of attaching to them a greater importance than is justified by the episodic character which she herself seems to have assigned them from the vantage point of a maturer judgment.

Old Testament Criticism and the Christian Church. By John Edgar McFadyen. New York: Charles Scribner's Sons., \$1.50 net.

The avowed purpose of this book is to bring about a better understanding between the critical and the conservative elements in the Christian Church, and for this work no one could be better

qualified than Professor McFadyen. He himself belongs to the critical school, and accepts without hesitancy the main points for which the critics have contended. But his spirit is so conservative, his manner so reverent, his sympathy so broad and his appreciation of the religious difficulties that the critics have raised is so keen, that he is able to speak to the conservative school more as a friend than as an alien. Of offensive partisanship the book is absolutely free, and one feels in reading it that he is listening to the conclusions of a fair and wise judge, who has heard with close sympathy and interest the evidence and the pleas of both sides in the case, and who gives a judgment which could not well be avoided. But in spite of these merits, we doubt whether the book will go far toward bringing about the reconciliation aimed at. The differences to be adjusted are too fundamental, too radical, and even in this volume, where every unnecessary difference is eliminated, the real difficulty becomes only the more apparent. Between the old theory of inspiration and the theory accepted by Mr. McFadyen—which proclaims it “revolting to our common sense to suppose that Esther and Ezra are inspired, while the Republic and the Antigone of Plato are not”—there can be no reconciliation save through surrender. Between the Christ of the old theology and the Christ of the critics, after all that can be said in the way of reconciliation, there is a difference that can be removed only by a complete readjustment of belief. If this book accomplishes anything in the way of harmony, it will be by the help it gives in this painful process of readjustment.

The Pauline Epistles. By the Rev. R. D. Shaw, M.A., B.D. Imported by Charles Scribner's Sons, New York. \$3.50 net.

The merits of this book are almost entirely literary. To one who cares little for the critical questions involved and whose interest is chiefly in the positive message of the Epistles, a better single volume could hardly be named. It is written in such a fresh and animated style that one is almost unconscious that

he is reading a commentary, and where there is theological argument or dogmatic controversy, it is set forth in language so simple and natural that even dogma ceases to be wearisome. The author has also a lively historical imagination, and presents with genuine dramatic power the historical background of the Epistles. But fine writing is hardly the demand of the day, at least among biblical students, and in spite of its literary excellencies this volume will command very little attention or respect among thoughtful readers. The author has historical imagination but lacks the historic *sense*. He has a knowledge of the critical questions involved, and assumes to use the critical method, but he lacks the critical *sense*. He is more adept in dealing with theories and arguments than he is in recognizing the force and significance of facts. In short, he is an advocate, with a tradition, or at any rate, with an idea, to uphold, and from the beginning, before any of the facts bearing on the case are cited, one feels sure of the conclusions to which he is going to arrive. Of the value of such conclusions even the most uncritical must have his suspicions.

The Silent Maid. By F. W. Pangborn. Boston: L. C. Page & Co. \$1.00.

A pretty story of enchantment, told in the cadence of quaintly turned English phrases. *The Silent Maid* is bewitched of her speech by the elf king in the forest where she lived long ago, so that she might not love a mortal man when she went among the peasantry of a certain noble lord to lighten their sullen nature by teaching them to sing. The author does not make it quite plain how she was able to sing and not to speak. But all enchantments are arbitrary, and this one does not interfere with the interest of the tale when the maid really does love the inevitable “mortal man.” In modern times such a conceit would be an absurdity, but cast far back into that green bow-ered past where even history is half mythological, the medieval atmosphere furnishes an excuse for all that is incredible.

Literary Notes

"THE SPOILSMEN," by Elliott Flower, has already attracted the attention of Grover Cleveland, Robert C. Ogden and Charles H. Schieren and is indorsed by them. (L. C. Page & Co.)

....Mrs. Julie Frankau, the wife of a wealthy London merchant, and a leader in London society, writes her third novel, "Pigs in Clover," under the pseudonyme of Frank Danby. (J. B. Lippincott Company.)

....Mr. F. Berkeley Smith, the author of "How Paris Amuses Itself," will again be in evidence as an author and illustrator this fall. His latest book, entitled "Budapest, the City of the Magyars," is announced for publication about September 15th. (James Pott & Co.)

...."The Negro Problem" is the title of a forthcoming book to be issued through Messrs. James Pott & Co. It will contain contributions by Booker T. Washington, Prof. W. E. B. DuBois, Charles W. Chesnutt, T. Thomas Fortune and other leaders of the colored people.

...."A Parish of Two," by H. G. McVickar and Percy Collins, is published by the Lothrop Publishing Company, of Boston. The fashionable society life in New York City and elsewhere furnishes the *motif* for the story. The authors are both men who know well the life of which they write. The story is based upon an exchange of letters between the two men, one set being written by each author.

...."Principles and Ideals for the Sunday School, an Essay in Religious Pedagogy," by Ernest De Witt Burton and Shailer Mathews, will be brought out through the University of Chicago Press. The book will appeal not only to teachers, but also to the boys and girls of grammar school and high school age.

....More Indian folk lore appears in "The Book of Nature Myths," by Florence Holbrook. This book is intended as a regular second reader for the primary grades, and will have a tendency to awaken interest on the part of the child readers, so that knowledge of folk lore will be absorbed as it were, almost without knowing it. The illustrations, by Mr. E. Boyd Smith, are of distinct value.

....Miss Gertrude F. Lynch is one of the editors of the Unit books now being issued by Howard Wilford Bell, of this city. There are some novel points connected with the unit books scheme, one of which is the idea of charging according to the number of units of printed matter the books contain, a unit being 25 pages, and the charge for each unit being placed at one cent. Fiction, science, memoirs, biography, poetry and the drama, history, adventure, travel, translations, law, logic and bibliographical books are comprehensively included in the series forthcoming as unit books.

Pebbles

A FOREIGNER'S LETTER TO THE ONES AT HOME.

RED BOTTOM, PA., October 8th.—My Dear Friends: This is an extraordinary country. Every day I find in it new things to excite my wonder. I have made it a practice from the moment of my arrival upon these shores to read the papers which represent the various political parties and social classes. This plan I have adopted in order to obtain information from both sides of every question. Hence I am able to form my own opinions without prejudice. I must tell you first of the condition of the country, as I find it to be from reading the Republican and Democratic party organs. The United States is to-day enjoying an unparalleled period of prosperity, with prices higher and the masses more badly off than they have ever been in the history of the nation. Happiness and contentment exist everywhere, and unless there is a change for the better soon it is almost certain that there will be a political upheaval at the next general election. There is no doubt that the plain people, who are for the most part living in opulent splendor, wish to let well enough alone, and the probabilities are that the shortsighted capitalists, who are not satisfied with millions, but must wring billions from the oppressed and long-suffering masses, are swiftly bringing their own destruction. Subdued murmurs of discontent are heard everywhere, and the whole nation appears to be happy in the enjoyment of an era of unexampled progress. There is work for everybody, and thousands of men still in the prime of life find themselves thrust aside unable to find employment because they have committed the crime of becoming 35 years of age. The outlook for the country is certainly a dismal one, but the bright star of democracy never shone with greater splendor than to-day. The republic is undoubtedly doomed if the breach between the classes and the masses goes on widening, but the manner in which the American people have adapted themselves to the requirements of a republic is wonderful. The trusts have made it impossible for a young man to hope for independence hereafter, and the chance for the American boy was never before as bright as it is to-day. The lowest, most humble lad in the land may aspire to the highest office within the gift of the people, altho it is a sad and solemn fact that money alone is the moving factor in American politics at the present time. I hope to be able to learn more about the people and their condition during my stay in this most blest and sadly misgoverned country.—THEOPHILIS FITZMAURICE GARMOYLE, in *Chicago Record-Herald*.

EDITORIALS

"Not Sprightly Enough"

A FEW weeks ago a chorus girl in one of the liveliest and most popular of summer operas committed suicide at her lodgings because she had been discharged the night before by the manager on the ground that she was "not sprightly enough." The play went on, amusing its audiences nightly. Probably no one missed her. Chorus girls look much alike anyway, and there are plenty of them. The ranks are easily kept filled. One can almost see the cue of young girls, all sprightly enough now, waiting at the stage entrance to take the place of any who drop out. No doubt the manager was correct in judging her guilty of the capital crime. He was merely the foreman of that jury of twelve hundred who sat nightly to see if she was sprightly enough; the great gray public which cannot amuse itself but must, like an Oriental monarch, hire others to appear to be happy before it and, since it pays for the pretense of joyousness, must get its money's worth.

Still it must have been hard for her, night after night, to dance and sing and smile, when she thought of what was coming when she could no longer please, when she felt her limbs, instead of moving with freedom and grace, already beginning to stiffen, when she saw the pit yawning before her. Gazing across the footlights into the spotted haze, the crowded faces with their critical eyes, and lips loosened to laugh, seemed to fuse into one with the hollow eyes and grinning teeth of the picture on the carbolic bottle in her little room. Could she smile into such a face? She must try, but her smile has an answering grimness and in her eyes there is no joyousness of life, only the fear of death.

The people did not come to see this. Tired by the long day's work at being sprightly themselves in office and in factory, they have pooled their craving for amusement, and the wit of one becomes the mirth of many. They have taken the color from their lives, leaving them gray, and put it all on the stage. They have cul-

tivated immobility of feature, they have lopped off every gesture, they have stilled every expression of emotion, driven every vestige of romance from their daily life, and so they demand it in exaggerated form in the theater. They must hire others to be witty and beautiful, since they have no opportunity themselves to be other than stupid and ugly. What should be the graces of life become the monopoly of the stage. What should be the spontaneous manifestations of their own joyousness become the tasks of those who take no joy in them. They sit still and look on while their proxies of pleasure sing, dance, laugh, recite poetry and make love on the stage. They get other people to do their work for them so they can enjoy themselves, which they do by getting other people to enjoy themselves in their presence.

The people feel defrauded when those they have hired to look happy at fifteen dollars a week do not show themselves so. How can they be merciful when they, like the chorus girls, feel the touch of the whip on their shoulders and the prick of the goad whenever they are "not sprightly enough"? Our preachers, our teachers, our generals, our mechanics, are cut off just as soon as they get a little stiff in the joints, no matter how clear they may yet be in the head. The longevity of the race is increasing, but the age limit is lowering. No matter how much a man may know, how good he is, the world has little use for him if he is "not sprightly enough."

To be wideawake, to be able to dodge, jump and turn quickly, are essential qualifications in "getting along" under the conditions of modern life. The trolley car and the automobile are excellent drill-masters in the art of "stepping lively"; those who are not agile or who are thinking of anything but the present and their immediate surroundings, get killed off. A few generations of continuous city life ought to produce a race which would be very lively steppers indeed; alert, alive, quick of decision and determined in purpose, with the powers of continuous thought and meditation atrophied,

with eyes all around the head, but no eye directed to the past or the future. Unfortunately for our speculations, Providence with its inscrutable purposes—let us even say wisdom, altho in this as in so many other ways it thwarts our most earnest efforts—has made it impossible for a city-bred race to exist long, and sterilizes those who possess in a marked degree the qualities which lead to success in city life. Providence has its own peculiar ideas of what is fittest to survive, very different from ours, and evidently does not esteem mere sprightliness the most desirable virtue to perpetuate. In fact, in the race of races, a certain stolidity, *naïveté*, deliberateness of thought and slowness of adaptation to changing environment, what some would even call stupidity, seems to hold its own surprisingly in the world in spite of all our efforts to eliminate these qualities and cultivate their opposites.

But for immediate and practical purposes, he who would succeed must be sprightly. It is in the city as in the surf, he who swims shallowest will be less likely to be caught by the undertow. It is dangerous to go deep. We need to add to our prayers, Give us this day our daily agility.

A Social Boycott

A CORRESPONDENT, a Northern woman who has lived for years in the South, offended not a few people in that region by declaring that there was no real freedom of thought tolerated in that section. They declared that the statement was not true. The treatment which Mr. John S. Wise has lately experienced in Richmond would seem to justify the charge.

Mr. Wise, son of the Governor Wise of the period of the Civil War, who signed the death-warrant of John Brown, is himself a Republican and a lawyer in this city, and has argued the case of the negroes who have been excluded from the polls by the new Virginia Constitution. His joining the Republican party was such a mortal offense, aggravated by his professional act, that he finds himself boycotted when he visits his ancestral home. Indeed, he has for this reason ceased the attempt to maintain social

relations which are refused him. For this reason he has lately given up his box at the Richmond horse-show next October.

John S. Wise is a man of high character and fine ability. He belongs to one of the most distinguished of the First Families of Virginia. He is a good enough man for the best society in New York. But he is not regarded as fit to associate with by the proud representatives of those families in Virginia. They pass him with a cold stare. It is all because he differs from them in politics. And yet they claim that they allow freedom of speech. It would seem that the charge made by our correspondent is true, at least in Richmond. A man is not free there to hold and express an opinion on political subjects which differs from that of other white men, and yet enjoy social equality. He can in New York; he cannot in Richmond, and we fear not in Charleston or New Orleans. This fact is an evidence of an imperfect civilization which has not yet reached the stage of tolerance.

We mentioned New Orleans, and here is another case, of a very different sort, from New Orleans. The American Federation of Labor, which covers North and South, proposes to organize the stevedores and other negro laborers into unions. White laborers are organized already, but not the negroes. The proposal to organize them is received with indignation by the New Orleans press. The leading papers declare that "the organization of negroes into labor unions ought not to be encouraged or tolerated by the white unions." Why not? Is this a free country, or is it not? Says *The States*:

"No man nor any organization is powerful enough to stem the tide of Caucasian sentiment on a question of this character."

It would seem that this "Caucasian sentiment" will tolerate no contradiction. An organizer of the Federation of Labor went to Vicksburg to organize the negro workmen there, and he was driven out of town; at least so he reports, and he did not think it healthy to remain. This, again, does not look like that freedom of thought and expression which

some of our readers tell us is fully allowed in the South.

The argument presented for not allowing freedom in this matter is significant. We again quote from *The States*, which declares that fellowship of white with colored labor unions is sure to result in social relations, and these must be absolutely forbidden. It says:

"It has been asserted by observant writers and thinkers that the amalgamation of the races in this country is inevitable in the course of centuries; that beginning with the very lowest classes of the whites it will slowly, but unceasingly and irresistibly, progress until in the end all visible traces of a negro race will have disappeared. We are wont to scoff at this theory, but nevertheless, while we scoff, that process is going on, and nothing will stop it outside of the absolute separation of the races.

"In our judgment the most insidious and dangerous advance made in that direction in recent years is this tendency in labor unionism to organize negro unions. It is but a step between industrial fraternity and social equality, and a very short step at that."

As the right of white laborers to organize does not, from the New Orleans point of view, involve the right of negroes to organize, even so the outcry raised against the whipping of a white woman in the Georgia convict farm must not be misunderstood to imply any objection to the whipping of negro women. It appears that the negro women there took advantage of the popular clamor to object to being flogged any more, but Captain Foster told them plainly that if they did not behave themselves they would not only be whipped but whipped severely. But he is not whipping white women any more. The Georgia Legislature is likely to pass a law forbidding the flogging of women. They can hardly frame a law applying the prohibition solely to white women, for that would be unconstitutional; but it will be easy to get over that difficulty, for they have had long experience in avoiding discrimination in the letter of the law while maintaining the discrimination in its execution. A law forbidding the flogging of women might easily be obeyed in the case of white women; but why should such a little matter as a law stand between a negro woman and the lash?

The Causes of Non-Church Attendance

THE recent careful census of church-attendance in London is giving rise to some very searching consideration of the causes of a serious decline. In 1886 a census was taken of the attendance on a single Sunday, with no distinction of age or sex. With that is to be compared the much more careful census just taken, which extended over seven months.

During these seventeen years the population of London has increased by about 500,000; but the attendance at the various churches has decreased. The population of London (excluding institutions) is a little less than 4,500,000, while the aggregate attendances at two services on a Sunday were 1,002,940. While the population has increased by half a million since 1886, the attendance seems to have fallen off by about 150,000. This decrease is almost entirely confined to the Church of England services, for while the Nonconformist churches show a falling off from 369,000 to 363,000, the Church of England attendances are reduced from 535,000 to 396,000. If we compare the total attendances of the different bodies we find the Church of England credited with 430,153; the Protestant Nonconformists with 416,225; the Roman Catholics with 93,572, and "Other Services" with 62,990, or a total of 572,787, against the 430,153 of the Established Church.

We may fairly suppose that one-half the population of a city can go to church if they wish. We may also fairly assume, with the experts, that of the total attendance 35 per cent. attend both services, which would reduce the total attendance to 850,000. It would then seem that over 1,400,000 needlessly absent themselves. That is, to quote the *London Guardian*, the leading Anglican journal, "about 60 per cent. of those who might go to church or chapel are kept away either by hostility to religion or by apathy," and the proportion of those who attend has, in the case of the Church of England, been reduced by one-fourth.

Now what is the reason for this diminution?

First and most important, we presume,

is the breakdown of the conventional obligation to attend church. Canon Scott Holland, in discussing the subject, tells the story of an Oxford dean to whom the sight of a scanty band of communicants at the college chapel called up the reflection that in his day the undergraduates "would have been gated if they had not been there," and he remarks that there is very little such moral "gating" for non-attendance now. People can stay away without losing caste. This means that those who go are those who want to go, and they are in church in spite of great temptations to go elsewhere.

Closely connected with this, if not another phase of the same explanation, is the great increase in the number and variety of Sunday amusements, the trolley, the golf links, the attractions of the country and sea side, the music halls, all of which draw off those who are not seriously inclined or not heartily attached to the churches.

We may add that as the struggle of life becomes more severe a great many, especially men, wish to take Sunday as a day of absolute rest, and that to dress for church and sit an hour or more in a pew is to them no physical rest or refreshment. This particularly forbids attendance twice on a Sunday.

But why is it that the Church of England services suffer more by this non-attendance than those of the Nonconformists? The explanation given by *The Guardian*, which ought to be a competent authority, is somewhat surprising. It recognizes the fact that the custom has become more general with the higher classes, which attend the Established churches, of going into the country for the Sabbath; but the chief reason which it suggests is that to the poorer people the elaborate form of worship is not attractive. They find it hard to follow the services in the Prayer Book, and the music does not appeal to them. This practically excludes them from taking part in prayer and praise, and they go to chapels, where they can find greater simplicity and heartiness.

Another reason given by *The Guardian* is an admission that Nonconformists pay more attention to the sermon than do the preachers in the Established Church. Indeed it says that this "extremely low

standard of preaching" is in part due to the "disastrous system of life-appointments" of incumbents, who hang on to their places when totally unfit to give instruction to the congregations to which they are "chained." Nonconformity has a more elastic system, and therefore draws the people to hear its better sermons.

But even Nonconformity does not quite hold its own, and yet we may be satisfied that it is the tens of thousands of serious men and women, who care enough for God and religion to support and attend the churches, whose moral influence will control public sentiment and govern the country. Moral earnestness will always conquer and rule in any conflict with indifference.

The Fate of the Salaried Man

MANY years ago in a noteworthy chapter of his fearless discussion, "What Social Classes Owe to Each Other," Professor Sumner called attention to "The Forgotten Man." This unfortunate member of society was neither rich nor poor. The execrations that fall on lords of industry were not meant for him. The sympathy that goes out to the unfortunate did not extend to him. His social function was to pay the tax which millionaires evaded and from which the poor man was exempt. He carried the burden of caring for the helpless, of relieving misery, merited or unmerited, and sustained the losses inflicted upon the business community by reckless financiering or the struggle between labor and capital.

Perhaps it is progress, perhaps something else, but the forgotten man no longer answers to Professor Sumner's description. Twenty-five years ago he conducted a modest business, or, from the saving of a comfortable salary, he had accumulated a little property, in spite of the tax gatherer, as provision for old age. His too faithful performance of his social function as general and residuary burden-bearer was his undoing. He voted for all the special legislation that corporations wanted, expecting thereby to improve business. He voted appropriations for education and

for libraries, for institutions of relief, and for administrative bureaus to aid and regulate all sorts of promising things. Then he paid the bills, submitted himself to regulation, and began to scan the improving business situation to find out what there was in it for him.

He soon enough discovered. The Trust, which he had all unknowingly helped to create, was already on the scene. It grew and multiplied. It took possession of industrial opportunities and of the channels of trade. And then it did something unexpected. It observed the forgotten man. Hitherto, whatever else he had endured, the forgotten man had enjoyed seclusion. Now he was dragged into the light and asked what he was good for anyway. Instead of answering: "I accumulate capital for industry to grow on, and I pay taxes that some one else would have to provide if I did not," he was unwise enough to say: "I do business; I am an independent operator; I compete with you;" or to say: "I am a professional man; I contribute something to society that is more important than material wealth; I work with ideas; I discover; I invent; I enlarge human knowledge." This made the trust laugh. "We can show you quicker ways of accumulating capital than by putting savings in the bank," it said. "Independent business enterprises, conducted by individuals, are not up to date. Those of you who are wasting life as our competitors may sell out to us if you like. We will pay you salaries to work for us if we find you worth while. Or, you can go through bankruptcy if that suits you better. As for you professional gentlemen, the sooner you quit dreaming and talking about your ideals, the better off you will be. Your ideas are too loose, and you speak your minds too freely. If you want to make a living from now on you will have to preach, or practice law, or lecture, or conduct your newspapers, to suit us. We don't think it necessary to buy out your good will, or to place you on our salary roll, but in one way or another you all will have to curb your tongues."

This purpose of the trusts, already partly realized, is likely to be more fully achieved in the near future. The middle class is becoming a salaried class, and

rapidly losing the economic and moral independence of former days. But it has not ceased to be made up of forgotten men. Every other class in society receives consideration of some kind—differential or sympathetic, as the case may be. Every other class enjoys some share of the "general prosperity" when times are good. The salaried man is notoriously at his worse estate when everybody else is making money. If the salaried man were not unselfish he would pray fervently for business disaster and industrial depression, for then only has his income a fair measure of purchasing power.

The years since 1897 have been "prosperous" beyond all precedent. The trusts, capitalized at over \$6,000,000,000, have made untold millions. The wages of labor have been forced up, after much hard fighting, twenty to thirty per cent. Salaries have remained practically unchanged. Meanwhile, the general level of prices has risen thirty per cent. Breadstuffs and farm products generally have risen even more than this amount. Thus, while the millionaires have doubled or quadrupled their fortunes, and the wage earners have obtained in advances a part of the increase of living, the salaried men, including the professional classes, are not more than half as well off as they were seven or eight years ago.

What, then, is to be the fate of the salaried man? This is one of the most serious questions of the time. The salaried class is evidently to be a large one. It is to include a majority of those men who hitherto have controlled American public opinion. What is to be the effect of the increasing economic disadvantage of this important part of the community? What will happen when the most intelligent third—and by all odds the most moral third—of our population finds that it can no longer associate with a third which admits none but millionaires into "society"? What will happen when the great middle classes, facing the increasing cost of living and the diminishing rate of interest on savings, finds that it can no longer make a decent provision for old age? Will it tamely submit to social inferiority, and settle down to make the best of a low standard of living? Will it be satisfied

with some makeshift provision, like an increased life insurance? We doubt it.

The situation is a dangerous one, and the multi-millionaires will do well to think about it. They can make no greater mistake than to suppose that they have made their fortunes through superior intelligence. "Money making power," as all the world knows, has been in large measure an unscrupulous use of corporate privileges created by wrongful legislation. The brains and the force of character of the American people are now where they have always been, in the middle class. When this class awakens to a realization that it has become a salaried class, with even less stake in "prosperity" than the wage-earner has, the day of corporate privilege and of private monopoly of opportunities that rightfully belong to all men will be over. Will the outcome be Socialism? The question is a good one for the multi-millionaire to ponder.

The Tourism Industry

It has been estimated that over 3,000,000 tourists visit Switzerland every year, almost as many strangers as inhabitants, and, if the gain from each one of the visitors is no more than seventeen dollars, the country realizes over \$50,000,000 from this source of revenue. On account of its infertile soil, its rigorous climate and its mountainous surface, Switzerland seemed condemned by nature to perpetual poverty, but by reason of the taste for wild and rugged scenery which has developed in the last hundred years it has acquired a greater wealth per capita than the level and fertile countries surrounding it. But it is not through its natural advantages alone that the Alpine region has come to be included in almost every European tour, however brief, but because here has been most completely developed what we call, somewhat inadequately, "the hotel business," but which the French, who coin words with less hesitation than we, have named "the tourism industry." The hotels of Switzerland, large and small, are closely associated not only with each other but also with the railroads, with the guides and with all the minor vocations which

live upon the tourist. They unite in publishing journals, books and maps, bargaining for supplies and boycotting, papers which find fault with their methods. Alpine tourists have often wondered that the guides were so much alike in their information, misinformation and lack of information, but the reason for this sameness in their ciceronage is due to the fact that there is a school for guides, where they are taught that curious medley of history, legend and biography which they exude so easily at the rate of three francs an hour. There are also given courses in cooking, marketing and serving, where the young waiter can learn the etiquet of the dining-room, how to get the largest possible tip for the least amount of service, to understand all languages, even the Ollendorffian dialects, and to produce from the kitchen as from a magician's bag any article of food or drink that his cosmopolitan guests may demand. Certainly tourism is entitled to the rank of a distinct profession.

In the United States this industry is yet in its infancy, in spite of its large proportions, developing slowly without the assistance of tariff legislation, for so far the Rocky Mountains have no protection against the competition of the Alps, and while Americans form only five per cent. of the tourists in that region, they very likely leave there some five million dollars a year. We are manifestly at a disadvantage compared with Europe, especially in the lack of historic, legendary and literary interest in this country. This fetishism of locality is strongly developed in many people, and when they visit an historic spot they feel themselves influenced by the thoughts or deeds which have made the place famous. Under this inspiration they behave very strangely, different people being affected in different ways, as in inhaling nitrous oxide, some weeping, some excitedly frivolous, some reciting poetry and some writing it, some seized with a mania for destroying the venerated relics and carrying away fragments of them. The influence seems to be something like the gas which escaped from the crevice at Delphi, which caused goats to caper and afterwards inspired the priestesses of the temples erected

there. According to our theosophical friends, this is an aura or emanation which lingers in the locality, a sort of a scent, as it were, which great men leave in their tracks and by which we can follow them, and this theory is supported by reference to the radiations given off by certain uranium minerals. It is a matter of common observation, however, that the sentiments and emotions aroused are not at all dependent on the reality of the event or the genuineness of the relics, for William Tell's chapel and the tomb of Hamlet work as well as any. This casts some doubt on the radio-active theory, for, in the case of the false localization of a fictitious event conceived by an author several hundred miles away, the corpuscles exciting the sentimentality must be exceedingly minute and diffused.

Whatever may be the cause of the effect of locality on the interest and the emotions, there is no doubt of its reality and power. According to our American custom of reducing everything to the common denominator of the dollar, it would be quite possible to calculate from the standpoint of the tourism business the pecuniary value of a legend or a poem. Who says poetry does not pay? How much is "The Prisoner of Chillon" worth to the hotel and shop keepers around Lake Geneva? They could have built the castle, yes, and hired several men to grow gray-haired in its dungeon for less than the contributions of romantic visitors have amounted to in the last ninety years. By means of "The Lady of the Lake" the barren hillsides of Loch Katrine and the Trosachs are able to support in affluence a large population. We call attention to these commercial aspects of the poetry industry for the purpose of arousing our numerous American Byrons and Scotts to a sense of their neglected opportunities. In order to get rich all a poet would have to do would be to get options on some point of scenic and historic interest and then write a great poem about it. He would then be able to live in luxury for the rest of his life on revenue derived from hotels and trolleys and from concessions to the vendors of postal cards, spoons and lithograph albums. Any promoting syndicate would finance a suitable poem under

these conditions, so if our poets only had more business ability they need not suffer the harrowing experiences of "Arthur Stirling." A man who intends to become one of the world's greatest authors should at least take the precaution to purchase a picturesque birthplace. Any old house would do, because if it is not already dilapidated enough, it would probably acquire a sufficiently antique flavor if he lets it age while he is becoming famous.

Our poets and novelists are somewhat at a disadvantage because our history is too recent to be romantic, but this gives all the greater field for the exercise of the creative imagination. There is no reason at all for importing as many ghosts as we do, and a haunted castle could be constructed in this country better than anything Europe can show. Good Indian legends can be grown in almost any locality with a little care and attention, and it adds an interest to a very ordinary cliff to know that a persecuted and necessarily beautiful Indian maiden leaped thence to her death. We have mountains of all shapes and heights; we have water in any desired form, still, running, spouting or frozen; we have nice clouds and elegant sunsets, for we have often heard people call them so; we have rocks and caves; we have the money, too. All that we need is great events and great authors. We shall be a formidable competitor for Europe just as soon as we have a lake with which are associated such names as Cæsar and Ariovistus, Calvin and Rousseau, Byron and Shelley, Gibbon and Voltaire, Amiel and Sismondi, De Candolle and De Saussure.

Labor and the Building Industry in New York

By their contest with employers the workmen of the building trades in the city of New York have already lost nearly \$40,000,000 in wages. For a long time more than 125,000 men were idle, and work was suspended upon structures representing an investment of \$90,000,000. A considerable number of men have been employed for a few weeks past, because the associated builders have induced unions that are not the blind

followers of their walking delegates to accept the provisions of a new arbitration agreement. Other unions—there are about forty of them in the building industry—have rejected this agreement at the demand of their walking delegates, the most influential of whom is one Samuel Parks, recently convicted of assault and now about to be tried under four indictments for blackmail and extortion.

The situation is one that deserves the earnest attention of all who are prominent in the labor organizations of the country. Why has not the arbitration agreement been accepted by all the unions? Mr. Moffett, the editor of the official organ of one of them (the Bricklayers' Union), publishes his opinion that "by a wide margin this is the fairest and best constructed plan of arbitration in existence." He adds:

"The interests of no one have been injured in it, except those of that type of walking delegate—unknown, happily, to our trade—whose reign is one of rule or ruin, and who more than once has given a black eye to trade unionism."

Here lies the secret of the stubborn resistance offered by certain unions now—and by nearly all at first—to the overtures and advances of the associated builders. Walking delegates have been fighting to retain the power which they had used dishonestly and to the pecuniary advantage of themselves. In some instances the loyalty of the rank and file to their chosen representatives, in others the fear of punishment which those representatives could inflict, has given them the continued support of a majority in their organizations. Slowly but steadily this support has been undermined and withdrawn, and now these unworthy leaders are striving to gain reinforcements by inducing a national union to suspend work upon the steel-frame buildings in all the cities of the United States.

When the builders in New York came together in May last and decided to suspend work until it could be resumed under satisfactory conditions, the situation had become intolerable. Agreements had been broken; delegates were ordering local strikes for the most trivial causes or for no cause whatever, and the entire building industry was constantly exposed to paralysis by sympathetic strikes

due to the refusal of some suburban dealer in lumber or other material to recognize a new union of his teamsters. Moreover, the builders were weary of paying corrupt delegates for peace. It is well known that large sums had been extorted from them. This is something as to which they are unwilling to give detailed information; but the public utterances of persons employed in the District Attorney's office, the statements made privately concerning the new house of the Union Club and other buildings, and the facts brought out at the trial of Lawrence Murphy, together with other evidence, tend to support the assertion which has been made that the cash extorted from contractors and builders in the last two years exceeded \$400,000 and may have been twice as much.

The builders stopped work and offered their plan of arbitration, with the avowed purpose not of eliminating the walking delegate altogether, but of taking away his power to withdraw men from work arbitrarily and to put them back again for a price. It should be borne in mind that wages and hours are not involved. Wages have been very high; a reduction of them is not proposed, nor is there any disposition to lengthen the work day. Not only are the unions to be recognized, but the builders bind themselves to employ union men exclusively when they can get enough of them. They are determined, however, that their work shall not be subject to repeated, unforeseen and unreasonable interruption, and that the reign of the corrupt walking delegate and blackmailer shall end.

They and the unions that have accepted their terms deserve the support of all honest union workmen in New York and elsewhere. The discredit which organized labor has already suffered by reason of this contest should not be made more injurious by the reinforcement of Parks and his associates through the agency of sympathetic strikes in other cities. If, however, such aid should be given, the situation would then so affect the interests of organized labor that it would demand a conference of labor leaders for a careful and conscientious investigation of it. Indeed, we are inclined to think that such a conference is warranted by the case as it

now stands. Owing to the part that corruption and extortion have played in this controversy, or in the events which led to it, the labor leaders of the United States might well unite in undertaking the work of purification. "Grafters" have had no place heretofore in the councils of American organized labor. They should be resolutely excluded now.

The Sun-Dance

The point of view of the anthropologist and that of the philanthropist are utterly different.

It is the business of the anthropologist to observe and record the habits, practices and beliefs of the rudest and most undeveloped tribes; while it is the business of the philanthropist to teach and elevate them out of their barbarism so as to make the most and best possible out of them. Both objects are laudable, altho in different degrees. The philanthropist blunders if he has no sympathy with the savage and can see no good in his beliefs and ways, which must simply be replaced by something more civilized. Equally the anthropologist errs, and errs more seriously, if he wishes to preserve races or tribes in savagery, as museum specimens, to be gazed down upon curiously by superior races, like devil-fish bottled up in alcohol for scientific study. A man's a man for a' that, be he Indian or Andamanese, and he has the right to rise, and our first duty must be to raise him. This matter is a practical one with us. Our Government has properly forbidden the sun-dance among the Indians, with its cruel and bloody rites, just as we forbid prize fights and bull fights, which are also interesting anthropological exhibits, or as the British Government in India forbids swinging from hooks or the burning of widows. A couple of anthropologists in California are charged with getting up sun-dances for the purpose of taking photographs. They defend themselves on the ground that "these dances constitute a religious observance." So the procession of Jugger-naut is a religious observance. They say:

"In ordering the dance prohibited the Government has been influenced largely by the Indian missionaries, who have never understood the sun-dance or, in fact, any of the religious ceremonies of the Indian tribes."

Those missionaries doubtless understand the sun-dance as well as anybody does; but they also understand that it stands for barbarism, which we do not wish perpetuated, even if these anthropologists do.

The Turkish Troubles

Conditions are growing worse and worse in both ends of the Turkish Empire.

The very important statement just issued by the Bulgarian Government puts the blame for the atrocities in Macedonia on the Turkish Government, and thus implicitly excuses the Bulgarian revolutionists. A multitude of instances are given, from official sources, of assassinations and other terrible atrocities committed by the Turks. It does not tell of the other atrocities committed by the Bulgarian insurgents, which may be just as bad. One of the most surprising phases of the uprising in Macedonia is the attitude of the Greek Christians in Macedonia, who fraternize with the Turks against their Bulgarian fellow Christians, and the utterance of the Greek Government at Athens, taking the side of the Turks, and advising the Greeks in Macedonia to denounce the revolutionists to the Turkish authorities. Not only are the Armenians in Eastern Turkey threatened by the Kurds, but also the seizure, by the Russian Government, of all their ecclesiastical property in the Caucasus, amounting to \$14,000,000, cripples them not only in any possible revolutionary designs, or even in self-protection, but makes it difficult for them to give help to refugees from Turkish danger. It is only the Armenians who have fled to this country, or to England or France, who enjoy peace and liberty.

Gaston and Alphonse

The reports of the subway disaster in Paris tell of the same conduct which seems always to characterize a French stampede, that the men trampled on the women or thrust them ruthlessly aside in the rush for the exit stairs. We have not forgotten that when the steamship "Bourgogne" was struck the Frenchmen temporarily abandoned their chivalry and filled the boats, leaving the women and children to perish; nor when the

great charity bazaar burned that gentlemen of the most fashionable set in Paris and bearing honored names deserted, and even in some cases struck down, the ladies who were under their protection that they might make their own escape. They trusted that none would be left alive to tell the tale of their cowardice and brutality, but, unfortunately for them, many of the ladies escaped through a back window, and there were some unpleasant scenes between their brothers and fathers and their recreant escorts. A frightened crowd is an awful thing, and no man who has not been tested can say with confidence how much of his etiquet and his ethics he will retain in such a crisis, but when disasters occur in countries not under the sway of the Salic law it seems somehow that a larger proportion of the weaker sex are saved. From their literature, their laws and their customs we know that Frenchmen look on women very differently from us, and their reputed conduct toward them in moments of danger is quite in accord with what we should expect from their opinion of the opposite sex. However, we do not venture to speak with confidence on this point, for every nationality thinks its own women are the best and the best treated.

The new Pope complains that they have put him in prison and then run away. Well, he has the key, beyond question; why does he not unlock his prison? He is better off than was his third predecessor, Gregory XVI, when he came to the gate of heaven, according to the story current in Rome when he died in 1846. It is said that when he knocked for admission Peter asked who he was. "I am your successor, Gregory," was the reply. "Then open the gate yourself," said Peter. "Did not I give you the key?" "Certainly you did; I forgot it." Gregory turned and twisted the key, and it would not open the gate. Peter bade him turn harder, but it was of no use. "Are you sure you have the right key?" said Peter. Gregory looked at it carefully and then exclaimed, "Oh! I have made a terrible mistake. It is the key of my wine cellar!"

Saul and Pulitzer are among the

prophets. The latter gentleman has given a million dollars to Columbia University to establish a school of journalism, and intimates that he may give another million. Columbia needs the money badly enough, and if the cost of some of the existing necessary professorships can be transferred to this new fund it will be a substantial advantage, and a considerable help toward the securing of the ten millions which President Butler asked for at his inauguration. Certainly good journalism requires somewhat indiscriminate general culture, and we can hardly think of a single department foreign to a journalist's profession.

It is difficult to understand the internal politics of the Catholic Church, and this fact is illustrated by the reported request to the Pope by a representative of the Archdiocese of Cincinnati that the American clergy be withdrawn from the government of the Congregation of the Propaganda and be put on the same footing as the Church in Catholic countries. Immediately several bishops have protested that they do not desire the change. We had not imagined that they did; it is rather the priests who wish, if we are correctly informed, to be delivered from the absolute rule of their bishops and to secure larger canonical rights.

A new metal is reported to have been discovered by a Frenchman, M. Edward Mollard, and the discoverer claims that it is lighter and stronger than aluminum, does not cost one-twelfth as much, has a higher power of resistance than iron and does not rust. From the description it seems to be an alloy of aluminum, something like the new alloy with magnesium, now sold under the name of "magnalium;" but the secrecy maintained by M. Mollard and the ambitious claims he makes for selium lead us to suspect that there is an error in cabling the name and that the *i* in the word should be an *l*.

We shall much regret to have Governor Taft leave the Philippines, but if he is to become Secretary Root's successor he will still have control of our new possessions. He should be succeeded by a man who is not a bigoted Caucasian.

INSURANCE

Strike Insurance Again

RECENT circulars announce that a Bureau for Inter-Insurance against losses by labor strikes under the style of the Employer Underwriters at the reciprocal exchange, has been established in Louisville, Ky., with Mr. W. C. Nones as its attorney and manager.

The plan of operation is that of reciprocal individual underwriting. Under this scheme the expenses of conducting the business have been rigidly limited to 20 per cent. of the premiums, thus leaving 80 per cent. thereof as available for the payment of losses. In addition to the payment of premium, the subscribers will be contingently liable for four times the amount of premium in case it may be required to pay losses. The subscribers underwrite severally and not jointly, so that no one of them can be held for the delinquency of any of the others. Policies will be issued only to persons, firms or corporations who are subscribing underwriters. The policies issued will be written in groups, whereby the underwriting of subscribers will be still further limited to losses incurred in the particular group or groups in which policies of insurance will be issued to them respectively. No policy will be issued in any group until that group is completely filled, and some little time will thus elapse after insurance is applied for before the policies can be issued. The Fidelity Trust and Safety Vault Company, of Louisville, Ky., has been selected as custodian of the funds of the bureau, and 80 per cent. of all premiums, when received by the attorney and manager, will be turned over to this concern for investment until required to meet losses. Provision has been made for continuing the business of the bureau in competent hands, in case of the death or permanent disability of the attorney and manager. The forms it is proposed to use in the business, including the subscription agreement and application for policy, as

well as the policy of insurance itself, have been submitted to eminent counselors at law, who have advised that the business, as it is proposed to conduct it, is entirely within the law. The business is purely and simply an insurance proposition, but it is not intended that insurance in this field is to be indiscriminately offered to employers of labor. The risks to be insured will be carefully selected and scrutinized, and only those employers who treat their employees fairly, in the true sense of the word, will be knowingly accepted as subscribers and policyholders. The attorney and manager will have power to cancel any subscription and policy at any time before a loss is sustained, and any unfair treatment of employers will act as a cause to bring about such cancellation. It is claimed that the business of the bureau will conserve the best interests of employees as well as of employers. The peculiar feature of the business is that no solicitor will be employed by the bureau. If any employer is not sufficiently interested to read and consider the carefully prepared forms, which will make the plan and scope of the business perfectly plain to him, he will not be annoyed by having the matter pressed upon his time and attention against his will. The forms will not be made public. They will only be submitted to selected employers, representing risks which it is believed can be accepted. On general principles secrecy is always bad business, but in order to protect himself in the use of the forms which he has devised, after a long course of careful study, the attorney and manager has resolved to keep secret these forms or the main features of them.

The present Advisory Committee of the Employer Underwriters' Association consists of the following gentlemen: D. M. Perry, Indianapolis, Ind.; Jesse Peterson, Lockport, N. Y.; F. C. Nune-macher, Louisville, Ky.; W. E. Caldwell, Louisville, Ky., and Henry Terstegge, New Albany, Ind.

FINANCIAL

Our Trade with Canada

OWING to the discussion in England of Mr. Chamberlain's projects concerning trade between Great Britain and her colonies, the official report of our trade with Canada during the last fiscal year is more interesting and significant than such statements in preceding years have been. It was in April, 1897, that Canada began to give to imports from the mother country a tariff preference of 12½ per cent. The preference was increased to 25 per cent. in August, 1898, and it has been 33 1-3 per cent. since July 1st, 1900. In spite of this advantage enjoyed by British manufacturers and exporters, however, the imports into Canada from the United States rapidly increased. In the past year both our exports to and our imports from Canada (\$123,472,000 and \$54,660,000, respectively) have been larger than ever before. The following figures, just published by the Bureau of Statistics, show the growth since 1896, the year preceding the grant of a reduction of duties on British goods:

	Imports from Canada.	Exports to Canada.
1896.....	\$40,887,565	\$59,687,921
1897.....	40,309,371	64,928,821
1898.....	31,870,486	83,714,086
1899.....	31,220,967	87,974,961
1900.....	39,369,074	95,319,970
1901.....	42,482,163	105,789,214
1902.....	48,076,124	109,642,993
1903.....	54,660,410	123,472,416

It will be seen that the British exporters' advantage of 33 1-3 per cent. in the Canadian tariff has not prevented an increase of our exports from \$65,000,000 to nearly \$123,500,000. A Canadian official report sets forth, as follows, the imports into Canada from the United States and from Great Britain in the same years:

	From Great Britain.	From the United States.
1896.....	\$32,979,742	\$58,574,024
1897.....	29,412,188	61,649,041
1898.....	32,500,917	78,705,590
1899.....	37,060,123	93,007,166
1900.....	44,789,730	109,844,378
1901.....	43,018,164	110,485,008
1902.....	49,206,062	120,814,750
1903.....	56,000,000	129,000,000

The increase has been \$13,000,000 in im-

ports from Great Britain, and \$71,500,000 in those received from this country. For the month of June, 1903, in this table the imports are estimated. The difference between the annual totals of the Canadian report and those of our Bureau of Statistics is probably due to the higher valuations imposed by Canadian officers.

Canada now takes 59 per cent. of her imports from the United States, and only 25 per cent. from Great Britain. Each of these two American countries is a natural and convenient market for the other, and tariffs cannot prevent an interchange of commodities at the boundary. But they do unnaturally restrict trade, and with respect to many products they are a burden that should be removed. We regret that this international trade is not promoted by a reasonable treaty of reciprocity.

ASSESSOR'S figures show that prominent New York capitalists and bank officers hold more than \$3,000,000 of stock in Chicago banks.

....Under Secretary Shaw's offer of March last to refund \$100,000,000 of bonds, short term bonds to the par value of \$81,000,000 have been received and exchanged for new 2 per cents.

....The branch concerns recently established in England by American manufacturers of electrical machinery have now on hand British contracts to the value of more than \$10,000,000.

....During the fiscal year which ended on June 30th 537 new national banks were organized, and 339 of these had a capital of \$25,000 each, approximately. These small banks are situated in places having a population of less than 3,000.

....Mexico's steel factory, at Monterey, is now in full operation, producing rails and the structural shapes used in buildings. The company's capital is \$10,000,000, and it employs 7,000 men at the works and in its mines.

....Dividends announced:

Buffalo & Susquehanna R. R. Co., preferred, 1 per cent., payable Sept. 1, 1903.

Survey of the World

The Field of Politics

In their State convention the Republicans of Nebraska unanimously supported John L. Webster, of Omaha, as a candidate for Vice-President. They congratulated the State because "we have made it manifest that there is no permanent place in American politics for a political leader who bases his claim for popular support upon the failures or disappointments of the people." Concerning industrial combinations the platform says:

"The Republican party recognizes that legitimate business, fairly capitalized and honestly conducted, has increased our industries at home and expanded our trade abroad, and enabled us successfully to compete with foreign countries in the markets of the world; but the Republican party is unalterably opposed to all combinations of capital, under whatever name, having for their purpose the stifling of competition and arbitrarily controlling production or fixing prices."

The wish is expressed that every ship carrying American goods and products into the harbors of foreign nations shall sail under the American flag, and the platform calls for legislation that will cause the desired change in our ocean carrying trade. Of course, Mr. Roosevelt is named for the Presidency in 1904.—At a banquet given to Secretary Root in Washington last week Postmaster-General Payne read a letter sent by Mr. Root to the Republican National Committee in 1900, declining to accept a nomination for the Vice-Presidency, the writer saying that after consultation with President McKinley it had been decided that the situation resulting from the recent war made it advisable that he should

remain at the head of the War Department.—In Ohio there has been a lively contest in the Democratic party for control of the State convention, to be held this week. Col. John L. Zimmerman is the candidate of the conservatives for Governor, and Mayor Tom L. Johnson, of Cleveland, is supported by the Bryanites. At last accounts the delegates were almost evenly divided, altho Colonel Zimmerman was saying that he had secured a clear majority of them.—At the National Encampment of the Grand Army Gen. John C. Black, of Illinois (Commissioner of Pensions in President Cleveland's first term) was elected Commander, and a resolution was unanimously passed congratulating "that splendid soldier, exemplary commander and patriotic citizen, Gen. Nelson A. Miles, upon his attainment of a distinguished and honorable retirement after a matchless record as a soldier of over forty-two years' service, without just criticism of his official conduct." The Service Pension bill was approved.—Mr. Bryan says that the nomination of Senator Gorman for the Presidency "is not to be thought of" because "it is evident that in the fight now being waged between the masses and organized wealth" the Senator's sympathies are with the latter. It was a great misfortune for the party, he adds, that Mr. Gorman was made Democratic leader in the Senate.—Interest in Mr. Cleveland's possible candidacy has been revived by the publication of a letter received by Henry S. Little, a prominent Democrat of New Jersey, from Ex-Senator James Smith, Jr., of that State, in which Mr. Smith said that Charles F.

Murphy and other Tammany leaders at a recent conference agreed with him that "the only thing to do was to nominate Mr. Cleveland," and that in his opinion the latter was the only man the Democrats could elect. Mr. Little, who, like Mr. Cleveland, is a Trustee of Princeton University, remarked that Mr. Cleveland, while he preferred to remain in private life, would, he believed, accept a nomination if convinced that it was his duty to do so. He expects that the New Jersey delegates will be instructed to vote for him in the convention, and he expresses a hope that the party will be "spared the humiliation of the nomination of a man like Ex-Senator Hill, who is absolutely unfit for the office." This excites the anger of Mr. Hill's friends. Mr. Murphy, the Tammany leader, admits that he regards Mr. Cleveland as the strongest candidate that can be named.—Official notification was given to the State Department on the 21st, by the Chinese Minister, of the purpose of the Chinese Government to open two ports in Manchuria on Oct. 8th, the date set for the evacuation of that province by Russia.

The Canal Treaty at Bogota

It appears that the unanimous vote of the Colombian Senate against the pending canal treaty was not a final rejection of the agreement, but was an expression of disapproval of it in its present form. Very little news has been received from Bogota since that action was taken, but it is known that the Senate, on the day following that vote, appointed a committee of three to confer with the House as to the preparation of a bill or resolution which should authorize President Marroquin to make a canal treaty upon certain specified lines, and also to ratify it without further Congressional action. It is reported that the amendments desired relate to the question of sovereignty on the canal strip, and especially to the character and jurisdiction of the courts. The unanimous vote of disapproval was due partly, it is said, to the dispatches sent to Minister Beau-pré by our State Department to the effect that any amendment would probably cause the rejection of the treaty at Washington. The substance of these dis-

patches was given to the Senate, and it is reported that some members of that body regarded them as threats. Altho there is believed to be in the House a majority for the treaty as it stands, the action of the Senate prevented action in the House, except such as may now be taken as a result of the conference. There is much dissatisfaction in Panama, but Dr. Herran, who represents Colombia at Washington, asserts that there is no indication there of an attempt to secede. The Minister representing Nicaragua says that if there is to be a renewal of negotiations with his Government the first step must be taken by the United States. Mr. Roosevelt is disposed to await official advices as to the action and intentions of the Colombian Congress.

International Yacht Race The first of this year's series of yacht races for the "America's" cup was sailed on the 22d, and at the end of it the "Reliance" was leading the "Shamrock III" by nine minutes. On the 20th the two yachts started for this race, but the contest was given up for lack of wind when only half the course of 30 miles had been covered. At that time, however, the "Reliance" was leading by nearly two miles and, in the opinion of good judges, had demonstrated her superiority over Sir Thomas Lipton's challenger. The course on the 22d was 15 miles to windward and return, beginning near the Sandy Hook lightship and extending south-south-westward along the New Jersey coast to a turning point in the neighborhood of Asbury Park. A fine breeze and a clear sky made the day an ideal one for such a race, and the contest was witnessed by a great number of spectators on excursion steamboats and private yachts. On the beat of 15 miles to windward the "Reliance" gained 3 minutes and 21 seconds over "Shamrock III," and on the homeward run she increased this lead by 5 minutes and 39 seconds, crossing the line just 9 minutes in advance of the challenger. This was reduced, however, to 7 minutes and 3 seconds by the time allowance of 1 minute and 57 seconds granted to "Shamrock III" as a result of the official measurement of the two yachts. In the

three races of 1901 the winner's lead was smaller, ranging from 41 seconds to 3 minutes and 25 seconds. Both yachts were admirably handled. The victory of the "Reliance" was due in large measure to her greater sail area. On the water line the length of each yacht is a few inches less than 90 feet, but the sail area of the American boat is 16,169 feet, against 14,337 for the challenger, which carries more sail than any of her predecessors. The cup was won in 1852 by the yacht "America" in a race around the Isle of Wight, and this is the twelfth attempt to regain it. The cost of these contests is indicated by the current estimate that the expenditures of Sir Thomas Lipton in his three campaigns have been not less than \$2,000,000.

The Government's Labor Policy

It was reported last week that, owing to the disclosures in the case of Miller (an employee in the Government Printing Office), the President had ordered an investigation in all the Departments, to ascertain whether there had been any discrimination against non-union or union men in the Government service. While it does not appear that such an investigation was ordered, it is known that inquiries have been made by the heads of Departments, in response to a letter in which, on July 22d, the Secretary to the President, at the direction of Mr. Roosevelt, called their attention to accompanying copies of the latter's two letters to Secretary Cortelyou, relating to the Miller case. We have referred heretofore to these letters. In the first (July 13th) the President ordered the reinstatement of Miller (who had been dismissed virtually at the demand of the union from which he had been expelled), and said:

"On the face of the papers presented, Miller would appear to have been removed in violation of law. There is no objection to the employees of the Government Printing Office constituting themselves into a union if they so desire; but no rules or resolutions of that union can be permitted to override the laws of the United States, which it is my sworn duty to enforce."

The second letter, dated on July 14th, was as follows:

"In connection with my letter of yesterday, I call attention to the judgment and award of the Anthracite Coal Strike Commission in their report to me of March 18th last:

"It is adjudged and awarded that no person shall be refused employment or in any way discriminated against on account of membership or non-membership in any labor organization; and that there shall be no discrimination against or interference with any employee who is not a member of any labor organization by members of such organization."

"I heartily approve of this award and judgment by the Commission appointed by me, which itself included a member of a labor organization. This Commission was dealing with labor organizations working for private employers. It is, of course, mere elementary decency to require that all the Government Departments shall be handled in accordance with the principles thus clearly and fearlessly enunciated."

Copies of these letters were sent to the heads of Departments, the letter of transmission said, "for your information and guidance, as they indicate the policy of the President in this matter." Thereupon inquiries were made in the navy yards and elsewhere, and notice was given that there must be no discrimination against union or non-union workmen. Some use of this may be made in politics. The Engineers' Union of Chicago is reported to have begun a movement designed to prevent union workmen from voting for Mr. Roosevelt in 1904.—The union which procured the discharge of Miller has placed in the hands of the Public Printer additional charges against him, to the effect that he was unkind to his wife in 1871, and that he was guilty of bigamy in 1888. Miller declines to make answer, saying that the charges are absurd.

Other Labor Questions

Samuel J. Parks, the walking delegate who recently asserted that he had ordered 5,000 strikes in the building industry at New York, was tried last week under one of the four indictments pending against him, and was found guilty of extorting \$200 from an employer named Plenty, as the price of ending a strike which he had ordered. Parks declared that he had never seen Plenty, but the check for \$200 was produced, and the evidence against him was convincing. The prosecuting officer sought

to show by his questions that Parks had been brought to New York from Chicago by a prominent construction company in order that he might order strikes on work in which that company was not engaged. The maximum penalty for his offense is imprisonment for five years. The District-Attorney has evidence in hand which will probably yield five new indictments against this man. His followers are now repudiating him, and a full resumption of work in the building industry seems near at hand.—Governor Durbin, of Indiana, has removed from office President McCleery and Commissioner Reardon, of the Police Board in Marion, where bitterly contested strikes are in progress, because they have declined to use their official power for the repression of violence in connection with these labor controversies. Their successors are men who will undertake to preserve order.—In St. Louis the local union of telegraphers applied for an injunction to restrain the Western Union Company from discharging employees because they were members of a union, and from keeping a so-called blacklist of the men discharged. Judge Rogers, of the United States Circuit Court, denied the application, holding that the company had a right to discharge at any time an employee not under contract; that the discharge of union men was not conspiracy (as had been alleged), because there could be no conspiracy to commit a lawful act; and that the company had a legal right to maintain a list of the names of discharged employees, with causes of removal, and might give this list to others, provided that its statements were true and that it was honestly circulated.—Judge Gray, who consented to serve as chairman of the Board of Arbitrators (or as umpire) in the controversy between the coal miners of Alabama and their employers, has announced the Board's decision. The wages of men working by the day are to be increased proportionately whenever those of miners working by the ton are increased by the sliding scale based upon the price of iron. Hereafter the men will be paid semi-monthly, and the commissary checks or credits issued to them will be redeemed in goods only when presented by the miner himself or some member of his

family. Men who work less than 20 days in a month are to be fined, if not disabled by illness, and the fines are to be paid into the treasury of the district union. Both sides agreed to submit the question of the employment of boys. The Board decides that no boys under the age of 14 shall be employed or permitted to be in the mines.

Our Islands in the Pacific

The War Department is considering propositions for the construction of a system of railways in the Philippines, and has been in correspondence with Governor Taft on this subject. Surveys have been made by engineers who were formerly interested in Sir William Van Horne's Cuban railway. It is proposed that a road shall be built from Manila to the most northern harbor of Luzon, with a branch extending to the East coast; that another shall extend southward from Manila to Batangas, and that shorter lines shall be constructed on other islands. As private capital would be unwilling in the present condition of the country to construct the proposed 1,000 miles of road without some assistance from the Government, and as such assistance could not take the form of land grants, the suggestion is made that the Philippine Government shall guarantee the interest on bonds representing the actual cost. The Insular Government, it has been decided, has ample authority to do this. The Department believes that the proposed railroads would be very useful in preventing insurrections as well as in developing the natural resources of the islands. The full beneficial effect of such railways could not be realized, however, unless steamboat lines should be established and maintained in connection with them; and such lines are included in the project.—The Vice-President of an American company holding contracts for extensive harbor improvements near Manila has forwarded to the War Department his opinion as to the use and value of Filipino labor. The company employs 1,000 natives. They must be taught, this officer says, by American superintendents, and they become good workmen if they are provided with comfortable homes, amuse-

ments and schools for their children. He opposes the introduction of Chinese labor, saying that the temporary advantage to be gained by the employment of Chinese workmen would be outweighed by the injury which both Americans and natives would ultimately suffer on account of Chinese immigration. The greatest need of the islands, he adds, is the abolition of the Dingley tariff duties on products of the islands shipped to the States.—The health authorities have reduced the death rate in Manila from 46 in 1900, and 38 in 1901, to 30 in 1902 and only 22 (thus far) in 1903, with which may be compared 22 for Washington, 24 for New Orleans, 20 for Boston, and 19 for New York. This has been accomplished in spite of the prevalence of cholera and plague during the last two years, and in opposition to the prejudice and ignorance of the natives, who are accustomed to conceal cases of infectious disease and have little knowledge of sanitary rules.—In Mindanao several of the native leaders have again rebelled against American rule. On the 21st the troops attacked a stronghold of the Dattos of Binang-Binang, on the shore of Lake Lanao, and captured it after half a day's fighting. The Sultan of Deseen has apologized for the recent treachery of his followers, explaining that it was due to the action of his son, whom he has punished by excluding him from succession to the Sultanate.—It is expected that the conflicting claims of Great Britain and our Government to several small islands near the north coast of Borneo will be submitted to arbitration.

Lord
Salisbury

Lord Salisbury died at five minutes after nine in the evening of August 22d, at Hatfield, the ancestral home of his family. He had been sinking rapidly for several days—indeed, he was a sufferer from Bright's disease for several years—so that his children and near relations had time to gather about him. He was the last survivor of the great statesmen of Queen Victoria's age, and with him may be said to have passed away a distinguished generation. In his early years he had, however, known real hardship. The family is descended from the second

son of the great Lord Burleigh, Queen Elizabeth's stalwart minister. This son, Robert Cecil, was created Baron Cecil of Essendine in 1603 and Viscount Cranborne the next year, this latter title remaining in the family as the inheritance of the heir apparent to the estate. The title of Marquis of Salisbury was bestowed in the year 1789. The late Marquis was born at Hatfield, February 13, 1830, and was christened Robert Arthur Talbot Gascoyne Cecil, being the second son. Following the tradition of his family he was educated at Eton and Christchurch, Oxford, and during his two college years was known as a diligent student. For several years thereafter he traveled, going as far as Australia, where, it is said, he lived the rough life of a miner. On returning to England he obtained a fellowship at Oxford, but soon left that retreat for a more active life, being elected a member of the House of Commons for Stamford in 1853. His allowance of money was not liberal, and in 1857 he pretty well severed himself from the head of the family by marrying the daughter of Edward Hall Alderson, a barrister who afterward became a judge. To eke out his living during these years he engaged in various kinds of newspaper and magazine work. In Parliament he took a firm stand on the Conservative side and made himself known for his caustic and relentless manner of debate, so that he acquired the name pretty generally of being a cynic. In 1865, while in the midst of a Parliamentary debate, he received word that by the death of his elder brother he was now become Viscount Cranborne and heir to the estates. The deceased heir had been blind and a great invalid. Lord Robert's promotion was immediately recognized by the Tory leaders, and in 1866 he was made Secretary of State for India in Lord Derby's Cabinet. Two years later the death of his father raised him to the peerage and put an end to his career in the Lower House. He is said to have regretted what seemed a cutting short of his political career and even to have consulted lawyers on the possibility of retaining his seat among the Commons. He soon, however, made a place of national importance for himself in the House of Lords. In 1869 he was elected

Chancellor of the University of Oxford, and in 1874 Mr. Disraeli brought him back into the Cabinet once more as Secretary of State for India. India at that time was under the stress of a great famine, and, as always, Lord Salisbury showed his efficiency in meeting the demands of the situation. At the close of the war between Serbia and Turkey, in 1876, he was sent to Constantinople as Special Ambassador, and with Sir Henry Elliot conducted a series of diplomatic concerns with advantage to England. Again, in the Berlin Congress, he faced the diplomats of Europe successfully. At last in 1885, on the fall of the Gladstone Ministry, he became head of the Cabinet as Secretary for Foreign Affairs. He held office for only a brief while, and on his retirement devoted much of his time to chemical and electrical studies. Again, after the defeat of Lord Rosebery's Liberal Government in 1895, Lord Salisbury was asked to form a Cabinet, and it was during this second tenure of the Premiership that he directed those diplomatic relations in the Far East and in Africa which are fresh in the world's memory. In 1902 he resigned the Premiership, and after that time took no direct part in national politics. He leaves five sons and two daughters.

The Humberts Convicted

The last scene of the Humbert trial caused as much excitement in Paris as any of the preceding days, and the evening papers could not be printed off fast enough to satisfy the buyers all over the city. The prisoners were brought into the court at noon, and maintained their customary pose of injured innocence. After the pleading of Advocate Hesse in behalf of Romain Daurignac, Mme. Humbert's brother, Mme. Humbert herself arose to make the revelations which she had so often threatened and which had been so eagerly expected. It will be remembered that the large swindling scheme of the Humberts depended on a fortune alleged to have been left them by an American named Crawford, who turns out never to have existed. Mme. Humbert's revelation was as follows:

"Gentlemen of the Jury: When I wanted the address of M. Crawford he answered:

"'You cannot know me. I am not called Crawford. I am not known by that name.'

"'Then what name?' I asked.

"He replied:

"'My fortune was made during the war of 1870, by reinvestments of rentes, which were then very low, and a large quantity was bought here.'

Mme. Humbert paused again, lengthily, and then continued:

"His name is Regnier, the intermediary between Marshal Bazaine and the Germans. I had already transacted business with one Regnier, who appeared to me to be a mysterious personage, and who said to me:

"'Be careful, Madame, not to confuse me with the notorious Regnier.'

"That is how I suddenly learned Crawford's name. I never told my husband. I swear on my daughter's head. This is the first time he hears the name."

Addressing the presiding Judge, Mme. Humbert went on, exclaiming:

"What I say is true. The Crawfords exist, the fortune exists, and I, Mme. Humbert, will bring actions against the Crawfords."

It is thus the French make all their doings interesting. The Regnier whom Mme. Humbert brought into the affair was sent by the Empress Eugénie, then at Hastings, England, on a mission to Bismarck in 1870. Regnier went to Metz, introduced himself to Marshal Bazaine and persuaded him to surrender to the Germans.—After being out for four and a half hours, the jury returned and brought in a verdict of guilty, no attention whatever having been paid to Mme. Humbert's sensational statements. M. and Mme. Humbert were sentenced by the court to imprisonment for five years and to a fine each of 100 francs. Emile Daurignac and Romain Daurignac were sentenced to imprisonment of three and two years, respectively. Maître Labori, the counsel for the defense, has put in a plea for a new trial on the grounds of technical irregularities.

The Bulgarian Insurrection

Within twelve hours after the arrival of the Russian squadron at Iniada, in Turkish waters, the Porte replied that the demands of Russia for the punishment of all concerned in the assassination of M. Rostkowski, the Consul at Monastir, and for the appointment of more efficient officers in the disturbed provinces, had all been complied with, and requested the withdrawal of the squadron on the

ground that its presence tended to encourage the insurrection. The Russian ships were immediately recalled to Sebastopol. Italian, English and French war ships are reported to be in readiness for immediate action, but so far there have been no naval demonstrations by any of the Powers except Russia. The efforts of the revolutionists to spread the disturbance eastward, with the view, presumably, of embroiling the Bulgarian Government, are apparently successful.

outrages of Turkish soldiers on non-combatants it is reported that troops on a train leaving Uskub fired on the Bulgarian workmen who were repairing the railroad track and killed eight of them. The Turks bombarded and destroyed the monastery of Constantine, near Losengrad, which was held by fifty insurgents. Three villages near Florina, containing Bulgarian revolutionists, have been captured by the Turkish troops and their garrisons,

The Balkans

They have burned thirteen villages in Eastern Adrianople, and their inhabitants have taken refuge across the Bulgarian frontier. A detachment of Turkish troops is reported to have been defeated there with a loss of 300 men, while the insurgents lost only fourteen. Telegraphic communication with Adrianople has been destroyed. Near Monastir three Turkish battalions attacked a thousand insurgents and were repulsed with a loss of over two hundred after a battle lasting six hours. As illustrating the

amounting to several hundred men, completely destroyed.

Belgian and Dutch Colonies

In May of this year a motion was introduced in the British Parliament which charged the Administration of the Congo Free State with violating the terms of the Berlin general act and called on the other Powers signatory to the act to adopt measures which would abate the evils prevalent in

that State. It was evident that Lord Cranborne and the Government believed in the maladministration of the State, but at the same time did not wish to sanction a bill which might offend Belgium. The bill after some debate was passed in an amended form, and as a result Sir Edmund Constantine Phipps, the British Minister to Brussels, has handed to Baron de Favereau, the Belgian Foreign Minister, a copy of the note addressed by Great Britain to the other Powers. The evils, which undoubtedly exist in Congo, however much they may be exaggerated in some of the reports, have arisen chiefly from the fact that when the State was founded by the King of the Belgians in 1885 all "vacant lands" were taken over the King's property. Now the *domaine privé* thus established was really the land from which the natives got the ivory and rubber which form the staple of Congo exports. The natives in this way became subject to the Government in a manner not far removed from slavery, since the products of the land were entirely controlled by a ring of seven trusts working for the private interests of the Belgian sovereign, and the tribesmen were forced to bring in ivory and rubber under the supervision and inspection of native soldiers, whose barbarity is said not to stop at cannibalism. "*Le Bulletin Officiel de l'Etat Indépendant du Congo*" has replied to the British note, asserting that the Congo State is independent of the Berlin act, that Belgium has faithfully observed its obligations to maintain an open field for commerce, and that the acts of violence, when committed, have been the work of private persons and have been properly punished by the State.—Holland, on the other hand, has succeeded at last in suppressing a rebellion in Sumatra, which has been going on intermittently in that island for thirty years. The original cause of the war was the refusal of the tribe of Achins (the name is variously spelt) to acknowledge the suzerainty of the Netherlands over the territory, and to obtain support in his opposition, the Sultan sent an embassy secretly to the United States diplomatic agent at Singapore. That was in 1873, and ever since that date the Dutch colonial troops

have been engaged in putting down one insurrection after another.

Manchuria After much pressure Mr. Conger, the American Minister at Peking, has obtained a written promise from Prince Ching that on October 8th he will sign a treaty with the United States which, among other things, will guarantee the opening of the two ports of Mukden and Tatung Tao. October 8th is the date agreed on by Russia for the evacuation of Manchuria, "if circumstances permit," and it has long been the design of this country to secure a definite promise from China that the ports of that province would then be open to commerce. According to Chentung Liang-Cheng, the Chinese Minister at Washington, China has been perfectly willing to make such an agreement, but has dreaded the complications which might arise with Russia. For one thing, Russia might take such a promise as a "circumstance" preventing her evacuation of the province. Meanwhile, according to a report of the American Consul at New-Chwang, Mr. Henry Miller, Russia is preparing to render the opening of the Manchurian ports as ineffective as possible. The chief exports from the United States to the province have been cotton goods, kerosene, lumber and flour. In each of these lines Russia is endeavoring to secure the lead and to establish herself so firmly that no opening of ports will affect her position. She is sending cotton goods from Moscow, kerosene from Southern Russia, lumber from Siberia and the Yalu, and flour from Harbin. Just before Mr. Miller's report was sent, a Russian steamer with 2,000 tons of lumber for the Chinese Eastern Railway arrived at New-Chwang. This was the first of a new Russian line of steamers entering into the coasting trade of Siberia, Japan, Korea and China. The name of the company is the Pacific Steamship Company Energia, and its head office is at Vladivostock. Many other lines of Russian steamers are actively engaged in the Pacific traffic, and the passenger boats plying between Dalny and Japan and between Dalny and Shanghai are well furnished and well provided in every respect.

Possible Hungarian Independence

By Francis Kossuth

[Francis Kossuth is the son of the famous Hungarian revolutionist who was so warmly welcomed in this country in 1851. He is the leader of the advanced Liberal party in Hungary. — EDITOR.]

AMONG the cherished principles that Americans have inherited from their fathers is the right of every nation to manage its own affairs in its own way, and to dispose of its own fate according to its own will.

The just God, who rules the affairs of nations, does justice to those who fight with an unconquerable, iron will for the cause of freedom and liberty, and the worst despots of Europe have been taught during the second half of the last century that the rights of many are more sacred than the right of one; and that the liberty of the people has to go before the selfishness of the ruler; so that "*the right divine of kings to govern wrong*" (as Pope wrote) has become now a right divine of the past!

In the States all elderly men remember the name of my revered father, Louis Kossuth. He was for a short time the welcome guest of the people and Government of the Great Republic, and their profound sentiments of sympathy and welcome were expressed on many occasions and in the most solemn form.

Louis Kossuth had fought bravely for the cause of human liberty and national independence. The citizens of the United States at that time were men of peace, but they knew that the world was wicked far beyond the ocean which separates their blessed land of liberty from old Europe, and that despotism which lives by violence and profits by iniquity can only perish by a sword; so they honored the man who stood up, sword in hand, against despotism which was denying the rights of a people worthy of freedom, punishing women by the scourge, imprisoning, torturing and slaughtering men, and corrupting the moral sentiment of all.

All these are things now of the past. Tyranny has met with its fate in Austria as well as in Hungary; and the monarch who began his reign as a tyrant is now a constitutional ruler, who was bitterly tried by fate and fearfully visited by God. He is now old, and has become

mild, and benevolent, and patient, and true to the oath he made, to respect the constitution of the country over which he rules.

But Hungary has never ceased to propose to exist not only actually but visibly on the face of the earth, and the people of Hungary know that it is impossible for their country to exist as a free state unless the independence of Hungary is complete.

The comparative peace and the unquestionable personal freedom which exist since 1867 in this country may satisfy many Hungarians as individuals, but cannot satisfy them as citizens nor as patriots whose duty is to make way for the independence of their country.

Many millions of people, out of the twenty millions of whom the greater portion owe their civil and political rights to Louis Kossuth, have never ceased to think and to feel as he did, and are now taking an active part in the political life of their country, as the "*party of independence*," erroneously called the "*independents*" by the foreign press.

This party, the aim of which is to make Hungary independent of Austria, is growing in strength and consideration every day, and it has now overthrown the Széll Cabinet and has forced his would be successor to come and negotiate about parliamentary peace.

It may interest the readers of this paper whether there is any likelihood of Hungary ever being independent of Austria.

Louis Kossuth believed in this, as in a natural consequence of the dissolving action of political liberty on the conglomeration of various nations and states which form the Austrian Empire, each of which has a past of its own, and several have been powerful and glorious independent states in the past.

The Austrian Emperor lost, a hundred years ago, the "Holy Roman" Imperial Crown, which was practically the crown of the German Empire.

The Imperial Crown of Austria is an empty title, and has been chosen because the Hapsburgs have long been Dukes of Austria.

When the whole German Empire stood behind the few millions of Germans living in Austria it was easy for the same to establish this hegemony, which they abused for several centuries.

But when Germany ceased to be under the rule of a Hapsburg Emperor, and especially when Austria was expelled from the German confederation, there was no more reason why Austria should continue to be a German State.

In round figures there are 26 millions of inhabitants in Austria and 20 millions in Hungary. The total number of Germans in Austria amount to 9 millions, and there are 17 millions made up of various Slavonic races. Austria is therefore practically a Slavonic state, and Hungary is a Magyar state, because in Austria nearly two-thirds of the population are Slavonic, and in Hungary 53 per cent. are Hungarians (the remaining 47 per cent. being divided among several races, of which the Roumanians are the most numerous).

It is quite clear that 9 millions of people cannot domineer over the other races, and yet they not only pretend to do so in Austria but even in Hungary; the Hungarian Army is commanded in German and has Austrian flags, a fact which revolts every true Hungarian.

The partial independence which the constitution of 1867 has procured to Hungary, notwithstanding all its disadvantages, has yet enabled the country to develop its resources and to make a steady and considerable progress, so that

it now stands on a level with any state as far as civilization goes.

And while the complete autonomy of Hungary in its internal affairs has produced this strengthening effect, the constitutional government in Austria has, on the contrary, disintegrated Austria by strengthening separately Austria proper, Bohemia, Galicia, etc.

Austria is therefore fast progressing on the way of total disintegration, and the endless difficulties which exist in the Vienna Parliament are but a visible sign of the process which is going on, and which nothing can stop, because it is a natural consequence of unavoidable premises.

The finger of God in the history of the Dual Monarchy points therefore to the separation of Hungary and Austria, which may perhaps become a confederation at some time, unless the unnatural ties which unite the two states increase the growing antipathy between the inhabitants of the same to such a degree that when the final crash comes it may become total and ultimate separation ensue.

It is absolutely certain that no such event is likely to happen during the lifetime of the present Emperor, but it would be a rash assertion to say that it is also excluded during the reign of his successor, who does not sympathize with the Hungarians, and stands in the repute of being under military and clerical influence.

Blessed be the land of liberty, where everything is settled according to the laws and the interests of the country, and where an ocean lies between the free citizens of the States and the nearest tyrant at hand!

BUDAPEST

The Rune of the Sea

By Gertrude Huntington McGiffert

THE fateful line of level light
Girdling the gilded sea;
The gnawing waves on the wastes of sand,
And the pitiless hunger for Thee.

The black hulks looming like ghostly dreams;
The wide, wide sundering sea;
And beyond—Eternity's desolate edge
That shadows Thee and me.

PELHAM MANOR, N. Y.

The Enfranchisement of the Negro No Blunder

By J. W. Hood, D.D

PRESIDING BISHOP OF THE AFRICAN METHODIST CHURCH

[The late utterances of Senator Tillman, Major Vardaman and others make this article particularly timely. Bishop Hood is one of the ablest and most influential among American negroes, and has a close acquaintance with Southern conditions.—EDITOR.]

I HAVE been informed on authority claiming reliability that about ten years ago a concerted effort was entered upon to prepare the minds of the American people for the contemplated disfranchisement of the negro; and that to this end the best writers obtainable were employed to prepare articles for such journals as are willing to publish that kind of matter.

It is not my purpose now to write a general defense against the many misleading and false statements with which the country has been flooded; but I want to ask attention to the other side of the oft repeated statement that this nation blundered when it gave the negro the right of elective franchise.

A false statement frequently told and permitted to pass unchallenged is sometimes accepted as truth. By making it appear that the enfranchisement of the negro was a great blunder, and that he was unworthy of the ballot, it was hoped that the way would be paved for his disfranchisement with general acquiescence. There can be but little doubt that to a large extent the intended effect has been achieved. Nevertheless, the enfranchisement was not a blunder; but was the negro's only salvation at that period and a blessing to the States.

Whatever tends to the elevation of any portion of the people is a benefit to the whole. And nothing has tended so much toward the elevation of the negro as the elective franchise. The benefit of enfranchisement to the negro personally will first claim our attention.

The worst condition in which a person could be placed is that of being a slave without an owner. With an owner he has some protection. Even an unmerciful man has some regard for the life of his beast. Cupidity if nothing else compels this. But the great majority of men in a Christian land have human feelings;

and become more or less attached to those who render faithful service; and when the service is long continued there is a growth of tenderness and sympathy; especially when the servant is property. In such a case, some masters were ready to defend the rights of a servant, or what they chose to demand for him, with their own lives. It was this disposition on the part of many masters to protect their slaves, even some who were not saints, which relieved slavery of some of its worst horrors and caused some to regard it as a blessed institution.

But when slavery was abolished the property right ceased and other ties were severed. Turned loose to remain in the presence of their former owners, who felt that they had been unjustly deprived of their property, the slaveholders would have been very different from any other humanity if they had felt like continuing a protecting and fostering care over the freedmen. Then it must be remembered that the slaveholders were a very small portion of the Southern people. Granting that they still felt a sympathy for the freedmen, and I am glad to bear testimony that many of them did, yet there were thousands who never owned slaves, and never had any kind of interest in the negro.

It must therefore be evident that the only way that the negro could have been protected in his rights at that time was to give him the ballot with which to protect himself, the best and surest protection that a freeman can have.

When a man has a vote, or, in other words, when a man is endowed with the full rights of a citizen, he is a factor that must be considered. Men who want his vote will seek him; and this puts him upon a plane which he could not otherwise reach.

When there were 20 to 24 negro members in the North Carolina Legislature

no measure especially intended to degrade the negro was ever adopted. Some were introduced, but they were referred to a committee, and that was the end of them. Not because the negro vote alone was sufficient to defeat such measures, but because it was not good policy to offend the negro members, whose vote had the same force as any other.

There were many measures which were not political. On all such measures it was just as easy for Democrats as Republicans to secure negro votes in support of their measures. Sometimes easier; for there was a larger number of the better class of white people on the Democratic side of the house, and negro members were always more ready to regard the wishes of that class when they could do so without sacrifice of principle. For instance, there was a measure before the Legislature of great importance to a certain section of the State which was antagonized by other sections. It was a thoroughly Democratic section, and therefore was mainly supported by Democrats. It was found that the only hope for the measure was in securing negro votes; but there was no negro in the Legislature from that section. So it was necessary to get certain negroes to certify to their brethren in the Legislature that the measure was all right. When that was done the necessary votes were easily obtained. It must be evident that men thus placed under obligations to the negro would not go out of their way to treat him unkindly.

The decision of the Supreme Court of the United States that the negro is entitled to a trial by a jury of his peers, and that the denial of this right is ground for an appeal to that court, was a result of his enfranchisement. Not much has been said about that decision; but it was by far the most important decision ever rendered in the negro's favor by that court. In view of that decision it seems to me that even Bishop Turner might overlook former shortcomings.

Having resided in the State of North Carolina nearly forty years, having visited every section of the State, and having known something of conditions, both before and since the enfranchisement of the negro, I do not hesitate to affirm that nothing else did so much to give

new life, vigor and healthy activity and prosperity to the Old North State as did enfranchisement.

The foundation for the wonderful improvements which have been made in this State during the last thirty-four years was laid in the Constitution which was adopted by the Reconstruction convention of 1868. Such a Constitution at that time would have been an utter impossibility without the negro vote.

Nothing can more clearly indicate the benefit of the negro enfranchisement than a comparison of that Constitution with the one adopted in 1865, under the Andrew Johnson plan of reconstruction. That plan left the negro out, and the Constitution adopted has the appearance of pages from ancient history when compared with the one adopted in 1868, in the framing and adopting of which the negro was a very important factor. It was simple, plain and complete. The antiquated laws and forms were entirely eliminated.

I noticed that soon after the Constitutional Convention assembled in Virginia last year there was a proposition offered to abolish the county court system of government. This was one of the things which was done by the convention in North Carolina in 1868, and indicates how far the State of North Carolina leads the "Mother of Presidents."

The number of negroes in the convention was not large. The majority of the convention determined that the Constitution should contain nothing respecting race or color, and so completely was this idea adhered to that even in the roll of members the race is not mentioned. I can therefore only give the number from memory. I recognize fourteen names belonging to those of the negro race, and I think that was the total number. This was a very insignificant portion of the total membership of the convention; but, by acting wisely, they exercised a very much greater influence than their number would suggest; and, besides this, there were a considerable number of white members who represented a large black constituency. For it was agreed by the colored leaders that in all the black counties a portion of the delegates should be white, and there was only one exception to this rule; and that was in a

county in which it was said that no white man would accept the nomination.

The convention was mainly divided between those who favored the Reconstruction on the Congressional plan and those who were opposed. They stood about 100 for and 20 against. But among the 100 there were several groups and different shades of opinion. There were the extreme radicals and the conservatives.

In the caucus of the majority which nominated the president of the convention there were three candidates; two Northern men—namely, General Abbott and Colonel Heaton—and one native North Carolinian—namely, C. J. Cowles. Mr. Cowles was the candidate of the conservative native group, composed largely of the old Union element from the West, and the largest group in the convention.

General Abbott and Colonel Heaton were both favorites with the colored members; but they thought it better to support the native candidate, and their support secured his nomination and consequent election. This brought the negro into alliance with the largest group in the convention, and this alliance was maintained until the close of the convention. On this account the negro exercised an influence which otherwise would have been impossible. He was represented on every important committee.

The Constitution formed by this convention provided for a splendid system of public instruction, such as had hardly been dreamed of before, modeled after the best Northern systems. In fact, we are not to-day up to what was provided for in that Constitution, and through all these years very little change has been made. It required a four-months school in every school district.

The homestead exemption was a new feature. As an evidence of the negro's influence in the convention, I may here state the following incident. When the homestead measure was under consideration in committee the negro member of the committee offered an amendment which was defeated; but he carried it into the convention, and after a hard fought battle between the ablest lawyers the amendment was adopted.

The rights of women, especially mar-

ried women, were guaranteed under this Constitution as they had never been before. The foundation for the public improvements which have so greatly benefited the State generally was laid by that convention and encouraged by that Constitution.

For all of this which tended to the up-building of every State interest the negro vote was solid. There was a sentiment in the convention in favor of disfranchising a certain class of those who had participated in the Rebellion. The negro stood with the conservatives against this measure. They said the General Government might disfranchise those who had rebelled against it; but for a State which itself had been in rebellion to disfranchise its citizens would be highly inconsistent; that while new citizens had been added we needed all the old ones. On the proposition to petition Congress to relieve certain citizens from the political disabilities imposed by the Reconstruction measures the negro vote was nearly solid, and a negro was made chairman of the committee to carry it into effect, and many citizens were relieved and thus enabled to hold office.

After the adoption of this Constitution there was always a considerable number of negro members up to 1896, when their election was prevented by intimidation and violence. The highest number, I think, was twenty-four.

Through all of that period the negro could always be relied upon to support such measures as tended toward industrial development and public improvements. There have been occasions in which his vote was needed in support of measures affecting the white people alone. The State University has at times needed his aid. There have been some who charged that it was maintained for the benefit of rich men's sons, and sectarian influence has sometimes been against it; but these things had no effect upon the negro. Any provision made for Confederate soldiers received his hearty support. I will not assert that there was no exception to this rule, and yet I know of none. But I speak of the general conduct of the negro legislators.

I regret the disfranchisement because it deprives the State of a large conservative force which has stood for the best

development of all its interests. The radicals are now in the saddle, as was shown by the latest Senatorial contest, and the best white people have their misgivings as to the final outcome. My own impression is that many will wish they had not permitted it.

But I regret the disfranchisement because it has rudely and harmfully shaken the confidence of the negro in the white people. No man can estimate the damage that has been done on this line. There was a state of confidence and good will existing between the white and colored people of this State, which made North Carolina the black's man favorite habitation. Whatever the condition of his race elsewhere, he pointed to North Carolina with pride. It was the Massachusetts of this Southland. Here he felt that his rights were secure. Here he had nothing to complain of; he had the opportunity to work out his own destiny, encouraged by his white neighbors. If they were not able to give him much help they had led him to believe that nothing should be permitted to hinder him in his effort to help himself.

It is true that there was no social intercourse between him and the white people; but he wanted none. He had his own social circle, of which he was so proud that he cared not for any other.

Everybody here knows that the talk about social equality is the shallowest kind of clap-trap kept up for effect. A black man may be the social equal of a white man and yet not want to associate with him. So I presume social intercourse is what is meant, which is a thing not thought of here. While the upright and intelligent black man does not admit any inferiority, yet he does recognize the line long existing, and is as little inclined to cross it as the white man is to have him cross it. It has made him clanish, and he feels as independent of white society as it can possibly feel of him. Our schools are separate; they were made so, not by law under the Constitution of 1868, but by mutual agreement. And neither party has shown any desire to have them otherwise. There was, therefore, complete harmony here.

But this disfranchisement came upon the negro like the shock of an earthquake. It came suddenly and violently. He does not, as yet, know to what extent he is hurt. Some, feeling alarmed, and others feeling a deep sense of the great outrage, have left the State; and others by thousands would go if they thought they could better their condition by going. Some are only waiting to see just how greatly they are damaged before making a move.

FAYETTEVILLE, N. C.

Man's Place in the Universe

A REPLY TO CRITICISMS

By Alfred Russel Wallace

MY article on this subject in the issue of THE INDEPENDENT of February 26th having excited considerable interest, and several astronomers having done me the honor to criticise it, I gladly take the opportunity now offered me of making a brief reply to some of my critics, and also of defining my position somewhat more clearly.

I may at once admit that my former article, owing to the limited time then at my disposal, was written somewhat hastily; and that I made several suggestions and admissions which were of

little importance to my general subject, but which laid me open to adverse criticism. Such were a comparison of the stars of the Milky Way with the molecules of a gas, a comparison which I think I have seen made by some writer, but which was suggested to me by the repeated statements in all astronomical works that the proper motions of the stars are *in all directions* and at various velocities, which quite accords with those of gaseous molecules. I now see that there is probably no justification for this idea, and that the facts that suggested

it are *apparent* only. A similar unfounded notion (I now think) was that of a variation of gravity near the boundary of the universe, which, like the supposed loss of light in passing through the ether, had better be altogether left out of our calculations till some evidence has been adduced in support of them.

One other point to which several of my critics have referred, and as to which I think they have somewhat misrepresented me, no doubt quite unintentionally, is my supposed statement that our sun is placed at the exact center of the universe. On looking over my article I find that I have in most places when referring to this question used qualifying words, such as "at or near the very central point"—that we are "nearly equally distant from every part of" the Milky Way—"that our sun is one of the central orbs of a globular star cluster," which cluster occupies "a nearly central position"—that it is "very near to, if not actually at, the center of the whole visible universe"—and then, for once, I omit the qualification and use the words, "in all probability, in the *center* of the *whole material universe*."

But this one slip some of my critics appear to have had chiefly in mind. Professor Turner says that my argument is that life "is only possible at the exact center," and that, tho our sun is a mere unit of the solar cluster, I claim that it is "the central unit," whereas I say only "one of the central orbs." Professor Marcel Moye twice refers to me as saying that the sun is at "the very center" of the Galaxy and of the universe (*Knowledge*, June, p. 132). This, however, is a matter of detail hardly worth referring to. I will therefore pass at once to the more important criticisms, which are three in number: (1) That I have given no proof that the stars are not infinite; (2) that the sun's motion through space shows that our present central position can only be temporary, and (3) that there is no advantage whatever in a central position. Let us consider these points a little further.

(1) Is the evidence at our command for or against the infinite extension of the stellar universe? This is the real question, the only question we are able

to discuss rationally. As to proof or disproof, either is impossible as regards what exists or what does not exist in infinite space. And even as regards the probability of any particular form of existence being infinite we have and can have no evidence, and without evidence it is irrational to hold any definite opinion. What I urged in my article was that we *do* possess several distinct kinds of evidence, all pointing toward a limitation of our stellar universe; and I still think that this evidence is sufficient, because this universe being on the enormous scale we know it to be, it is the only kind of evidence we can possibly get. I also find that most students of general astronomy express themselves quite clearly on this point. Sir John Herschel says that in some parts of the Milky Way there are "spaces absolutely dark *and completely void of any star*, even of the smallest telescopic magnitude," and that, in other parts,

"extremely minute stars, tho never altogether wanting, occur in numbers so moderate as to lead us irresistibly to the conclusion that in these regions we see *fairly through* the starry stratum, since it is impossible otherwise (supposing their light not intercepted) that the numbers of the smaller magnitudes should not go on continually increasing *ad infinitum*. In such cases, moreover, the ground of the heavens, as seen between the stars, is for the most part perfectly dark, which again would not be the case if innumerable multitudes of stars, too minute to be individually discernible, existed beyond."

And again, after stating that throughout by far the larger portion of the Milky Way the background of the sky is generally black, and that there is also an absence of excessive crowding of minute stars, he concludes that we have "unequivocal indications that its dimensions *in directions where these conditions obtain* are not only not infinite, but that the space-penetrating power of our telescopes suffices fairly to pierce through and beyond it." *

These opinions of the man who had studied the whole sphere of the heavens most completely, and who had calmly and deliberately thought out most of the great problems of astronomy throughout a life devoted to the science, are certainly

* "Outlines of Astronomy," last edition, pp. 578-579.

worthy of our attention, and should outweigh the opinions or prejudices of those who ask for proofs of what cannot be proved.

Among modern astronomers Dr. Isaac Roberts tells us that eleven years ago he took photographs of the Great Nebula in Andromeda, and has recently taken photographs of the same object with the same instrument (his 20-inch reflector) and with the same exposures, but with more sensitive plates than were obtainable at the earlier period. But altho in the more recent plates both the nebulosity and the star-images are denser, they show no greater number of stars than the earlier ones. Exactly similar facts are recorded in the case of the Orion Nebula and the Pleiades.

Another modern astronomer, Mr. J. E. Gore, speaks very strongly on this question. He says:

"Those who do not give the subject sufficient consideration seem to think that the number of the stars is practically infinite, or, at least, that the number is so great that it cannot be estimated. But this idea is totally incorrect, and due to complete ignorance of telescopic revelations. It is certainly true that, to a certain extent, the larger the telescope the more the number of the stars seems to increase; but we now know that there is a limit to this increase of telescopic vision. And the evidence clearly shows that we are rapidly approaching this limit. Altho the number of stars visible in the Pleiades rapidly increases at first with increase in the size of the telescope used, and altho photography has still further increased the number of stars in this remarkable cluster, it has recently been found that an increased length of exposure—beyond three hours—adds very few stars to the number visible on the photograph taken at the Paris Observatory in 1885, on which over 2,000 stars can be counted. Even with this great number on so small an area of the heavens, comparatively large vacant places are visible between the stars, and a glance at the original photograph is sufficient to show that there would be ample room for many times the number actually visible."

And, referring to the fact that, near the North Pole of the Galaxy, Celoria, with a quite small telescope he was able to see almost exactly the same number of stars as Sir William Herschel, with his very powerful instruments, he remarks:

"Their absence, therefore, seems certain proof that very faint stars do not exist in that

direction, and that here, at least, the sidereal universe is limited in extent." *

These extracts are sufficient to show that astronomers of repute, and with a combination of practical and theoretical knowledge which I make no claim to possess, have arrived at the conclusion that the stellar universe is limited in extent; and I might have quoted Professor Newcomb, Miss Clerke and many others in a similar sense. But directly I, an outsider, venture to set forth the same view, and found it upon three distinct kinds of evidence, of which this is one, I am accused of "starting a myth," and it is asserted that my "attempted demonstration of the finite nature of the universe breaks down entirely." This statement is founded upon the possible and probable existence of dark stars and other cosmic matter to such an enormous amount that they would shut out the light from all stars beyond a certain distance. Of course, there probably are great numbers of dark stars, but what proportion they bear to the bright stars no one can tell at present. It is a point which cannot be determined from any general principles, because it must depend upon the whole series of causes which produce so many luminous stars. We must know what is the average life of a luminous star, and also what is the average dormant period of a dark star before it becomes luminous again, if it ever does so. Of these two groups of facts we know absolutely nothing, except that there has been very little change in the brighter stars during the historical period, and that our sun has certainly been giving out both light and heat to nearly its present amount for many millions of years. We may fairly suppose that the dark stars are at least equal in number to the bright ones, or, perhaps, that they are ten times or a hundred times as numerous; few probably would believe, without any evidence whatever, that they are a thousand times as numerous. But even if they were so abundant as this they would not materially diminish the light of the stars, as has been well shown by one of my less adverse critics, Mr. W. H. S. Monck, who on this point is on my side. In *Knowledge* (May, 1903), he shows that the differ-

* "Concise Science Astronomy," pp. 538-540.

ence between the light the stars actually give and what they would give if they extended to an infinite distance, and were distributed in anything approaching a similar density, is so enormous that, even if the dark stars were 150,000 times as numerous as the bright ones and both extended to infinity, every part of the heavens should be as bright as the face of the moon. Few persons, I presume, will claim that they are more numerous than this high proportion, while even if they are so numerous some one or more occultations of bright stars (not due to a dark companion) would almost certainly have been observed, since we must assume that all these dark stars have on the average an equal size and as great proper motions as the bright ones. A dark star with a diameter of a million miles and a velocity of ten miles a second would occult a star of the same size and double the distance for about fourteen hours, but with only a few minutes of total obscurity. If the dark star were larger and the bright one less distant from it the period of obscuration would be greater. As such occultations of lucid stars would be visible to the naked eye, and from what we know of the proper motions of the stars and their great diversity of size, might last for periods of from a few hours to a few days, *and not recur*, and as such a phenomenon has *never* been observed, we must conclude that the proportion of dark bodies is *not* so excessive as in the case supposed by Mr. Monck, and therefore that the stars as a whole—bright and dark—are not infinite in number.

My critics who put forward the hypothesis of dark stars partially obscuring the bright ones, and ultimately totally obscuring those beyond a certain distance, do not attempt to show what that hypothesis implies, or consider if it would explain the observed facts. They ignore the essential point in the evidence, which is, that the ratio of increase in the number of stars from magnitude to magnitude, as determined by the lucid stars, continues to be fairly accurate down to the ninth or tenth magnitude, and then, almost suddenly, ceases to be accurate, so that all minute stars down to the seventeenth magnitude are much less numerous than they ought to be. If we assume

dark stars to exist in any large proportion we have no right to assume that they are distributed very differently, on the average, from the bright ones. Consequently, the lucid stars and the telescopic stars down to the tenth magnitude ought to have their light diminished in the same proportion as the remainder down to the seventeenth magnitude. We must remember that there is no proof whatever of these very minute stars being on the average further off than the rest. If they are most abundant in the Milky Way, so are stars of the first magnitude. Professor Newcomb says:

"The smallest stars that we see with the most powerful telescopes are not, for the most part, more distant than those a grade brighter, but are mostly stars of less luminosity situated in the same regions."

Then we have the remarkable fact that the 31 bright stars, above 3.5 magnitude, whose parallax has been measured are twice as far from us on the average as the 41 stars from 3.5 down to 9.5, these being the whole of the stars whose distances Professor Newcomb considers to be fairly well determined. Mr. Thomas Lewis, of the Royal Observatory, Greenwich, announced the same fact in 1895, but dividing the stars somewhat differently. He found that stars from 2.70 down to about 8.40 magnitude had, on the average, double the parallaxes of the brighter stars above 2.70, and were therefore only half the distance from us. We thus see that there is no fixed relation between the apparent size and the nearness of the stars, and it follows that the rapid diminution in the number of stars below a certain magnitude cannot be explained by any amount of dark bodies unless we suppose also an exceedingly unequal distribution of those bodies. Hypothetically numerous dark stars, hypothetically distributed, do not form a very strong argument for rejecting direct inferences from the distribution of the stars. I therefore venture to think that the three converging lines of evidence which I have adduced, leading to the conclusion that the stellar universe is limited in extent, have not even been weakened by the arguments hitherto brought against them.

(2) The next point urged by my critics, and that on which they lay most

stress, is, that even if our sun is in a central position now, its known motion through space shows that the position is only temporary and can have no real significance. Professor Turner assures us that, without the tremendous inference I draw from it,

"the fact itself, if fact it be, can only invite our polite attention as a curious coincidence. Even as a coincidence it does not take high rank; for it can, in any case, only be temporary. If there is a center to the visible universe and if we occupy it to-day, we certainly did not do so yesterday, and shall not do so to-morrow. The solar system is known to be moving among the stars with a velocity which would carry us to Sirius in 100,000 years if we happened to be traveling in his direction, as we are not. In the 50 or 100 million years during which, according to geologists, this earth has been a habitable globe, we must have passed by thousands of stars on the right hand and on the left."

And he concludes that

"so far from our having tranquilly enjoyed a central position 'in unbroken continuity for scores or perhaps hundreds of millions of years,' we should in that time have traversed the Universe from boundary to boundary."*

Taking Professor Newcomb's estimate of the dimensions of the whole stellar universe, he finds that we should pass across it from boundary to boundary in forty-five million years. Thus lightly and confidently does Professor Turner dispose of the fact that we are, broadly speaking, in a central position with regard to the Milky Way.

Mr. E. Walter Maunder (in *Knowledge*, April, 1903) supports this view. He says, speaking of our sun's motion through space:

"If this pace has been maintained in a straight line, five million years ago we were deep in the actual stream of the Milky Way; five million years hence we shall have completely crossed the gulf which it encircles and again be a member of one of its constituent groups on the opposite side."

This statement begins with an "if," but it concludes so positively that no reader would imagine there was any reasonable doubt as to the conclusion arrived at.

Another astronomical critic, Prof. Marcel Moye, of Montpellier University, adopts the same view (in *Knowledge*, of June, 1903). He says:

"Further, if, by hypothesis, at a given instant, the sun were at the center of the universe, it would lose its position soon, and never return to it again. We must not forget the proper motion of our luminary, a motion of ten miles per second, at least."

The views here stated by three official astronomers have greatly surprised me, because they assume that the sun, and presumably most of the other stars, are alike moving in straight lines at various speeds and in various directions, and that these motions have been in the same straight lines for many millions of years past, and will be so for many million years to come, carrying us and them in various directions into or beyond the Milky Way. As regards our sun this view is put forth as a proof that its present nearly central position cannot have existed in the past and will not exist in the future; and, therefore, as a complete refutation of my view, that its present central position is a fact of great significance.

Now what surprises me is that all these gentlemen should have either forgotten or have purposely ignored the existence of gravitation. For within a system of hundreds of millions of suns, irregularly distributed, and supposed to be on the average much larger than ours, motion in a straight line, not only for millions of years, but for any one year, is impossible. This view of even approximately straight line motion of our sun—"traversing the universe from boundary to boundary"—implies that such motion was not acquired by gravitation within the universe, but was given to it by some outer force; and, therefore, if *all* the proper motions of the stars were acquired in the same way—that they were driven into the universe from without—then indeed the whole system would be more analogous to the molecules of a gas than to a universe in which gravitation was the chief or the only ruling force.

Still more surprising is the circumstance that my critics have ignored the fact that this determination of the sun's motion at a certain rate and in a certain direction is founded upon an *assumption*, which assumption is known to be partially and may be wholly erroneous. The assumption is that the proper motions of the stars are not systematic, have no re-

* *The Fortnightly Review*, April, 1903, p. 600.

lation to each other, but are wholly random motions. Now, in the first place, hardly any mathematical astronomers believe this to be really the case, and many are searching in every direction for *systematic* motions in some part or the whole of the heavens. And, in the second place, some such systematic motions do actually exist. By carefully charting all the proper motions known at the time, the late Mr. R. A. Proctor showed that in various parts of the heavens groups of stars were moving together in the same direction and at exactly or nearly the same speed. Five stars in the Great Bear, three in Cassiopeia, and almost all in the Pleiades thus move together. He termed these motions "star drift," and till such motions are carefully searched for and compared with each other we cannot say that the apparent motions of any stars are not systematic. M. Rancken and Mr. Maxwell Hall have both discovered what they believe to be very extensive systematic motions.

As to the effect of these facts and indications upon the determination of the direction and rate of motion of our sun, I will give the opinion of three astronomical writers of repute. Mr. W. H. S. Monck, of Dublin, says:

"The proof of this motion rests on the assumption that if we take a sufficient number of stars their real motions in all directions will be equal, and that, therefore, the apparent preponderances which we observe in particular directions result from the real motion of the sun. But there is no impossibility in a systematic motion of the majority of the stars used in these researches which might reconcile the observed facts with a motionless sun. And, in the second place, if the sun is not in the exact center of gravity of the universe, we might expect him to be moving in an orbit around this center of gravity, and our observations on his actual motion are not sufficiently numerous or accurate to enable us to affirm that he is moving in a right line rather than in such an orbit."

Again, Miss A. M. Clerke, the historian of modern astronomy, in her "System of the Stars," speaks still more strongly on the same question, as follows:

"For the assumption that the absolute movements of the stars have no preference for one direction over another forms the basis of all investigations hitherto conducted into

the translatory advance of the solar system. The little fabric of laboriously acquired knowledge regarding it at once crumbles if that basis has to be removed."

And quite recently Mr. W. W. Campbell, of the Lick Observatory, writes as follows:

"The motion of the Solar System is a purely relative quantity. It refers to specified groups of stars. The results for various groups may differ widely, and all be correct. It would be easy to select a group of stars with reference to which the solar motion would be reversed 180 degrees from the value assigned above."*

It appears, then, that whether we consider the effects of gravitation, which almost always lead to motions either in elliptical orbits or in some other allied curves, or whether we take into account the extreme uncertainty, if not total invalidity, of the data on which all determinations of the sun's motion through space depend, my chief astronomical critics have misled their readers by setting before them the supposed motion of the sun as if it were certainly in a straight line and not in some orbit around a center, and also as if both its direction and velocity were determined by methods of observation as secure as those by which the distances of the sun and of the nearest stars have been measured. So far, then, as the objections to my views depending upon the sun's motion through space are concerned, I submit that I have shown them to be wholly worthless.

(3) The third most confidently stated criticism of my article was that, even if we were in a central position in the stellar universe, and if that position were a permanent one, it would not be of the least use to us as an inhabited world. Professor H. H. Turner says:

"We have no reason for supposing that if the stars were blotted out of existence our sun would become dead and cold sensibly sooner than under present conditions. The accepted belief is that his slow contraction is sufficient to account for the energy radiated, and other observed phenomena; and it has never, so far as I am aware, been suggested that we are kept alive by the attractive powers of our neighbors, the fixed stars, or by their influence in any other form. We might wander into outer space without losing anything more

* *The Astrophysical Journal*, Vol. XIII, p. 87, 1901.

serious than we lose when the night is cloudy and we cannot see the stars." *

Now this way of looking at the question is a very one-sided and imperfect one. We are situated in a vast universe and are products of it. We cannot detach ourselves from it and say, "we do not want the rest of the universe; the stars are no good to us; so long as we have our sun all the rest may go." The universe is a mighty organism; its whole aspect and structure assure us of the fact. We are a portion of it, and owe our position, our surroundings, our very existence to it. Looking at it as an evolutionist, I believe that it is only by tracing it back to some necessary earlier state that we shall be able to form some rational conception of *how* it has evolved, *how* it has come to be what it is, *how* we have come to be where we are. Then, and then only, shall we be able to give any probable answer to the question, What advantages have we derived from our nearly central position?

On all these points I could find hardly any suggestions of enlightenment in astronomical literature, but, rather, what seem to me now to be unnecessary difficulties thrown in the way of the inquirer; and at the time I wrote my article I had no clear ideas on the subject myself. Hence my vague and weak suggestion of stellar radiations affecting us. But, having undertaken to write a book upon the same subject as my article, I have for some three or four months been almost daily more or less occupied with it, and have quite recently reached what is, to myself at all events, a satisfactory explanation.

Light first came to me through reading (so far as a nonmathematician can read such a work) Lord Kelvin's remarkable article in the *Philosophical Magazine* of January, 1902, "On the Clustering of Gravitational Matter in Any Part of the Universe." In the first place, this removed the difficulty, which almost all writers upon the stellar universe had dwelt upon, as to the proper motions of the stars being often so large that they *could not* have been produced by gravitation within the universe. By different, but yet quite probable assump-

tions as to the primitive extent of the universe and the mass of matter within it, Lord Kelvin shows that the average proper motions are such as *could be* produced by gravitation. But he does not, as I had hoped he would have done, go on to explain how his preliminary assumptions would or might lead to a universe constituted like that which we see around us.

Having arrived at the last chapter of my book I was for some weeks puzzling myself over this problem, *some* solution of which I felt to be essential to the completion of my work; and at last—as I usually find to be the case—the sought-for solution came to me, and brought with it, as I had expected it would bring, a very clear explanation of the extreme importance of our central position as the only one which could afford the conditions which are absolutely essential for the long processes of life development. This enabled me to complete my work, which is now ready for the press, and I hope will be published shortly after the appearance of this article.

The careful study of the whole subject during the preparation of this work has greatly strengthened the position I took in my first article. In the portion devoted to the biology and physics of the earth and solar system especially, I have found that such delicate adjustments and such numerous combinations of physical and chemical conditions are required for the development and maintenance of life as to render it in the highest degree improbable that they should all be again found combined in any planet; while within the solar system this improbability approaches very near indeed to a certainty. This part of my work contains so much novel and suggestive matter as to throw quite a new light on a subject which, so far as I know, has never before been so fully discussed.

In the astronomical portion of the volume also I have shown that a large body of facts due to recent researches have a direct bearing upon the question of there being other inhabited planets revolving around other suns. On this question of course there can be no direct evidence; but the facts that I adduce will, I think, satisfy those who come to

* *The Fortnightly Review*, April, 1903, p. 600.

the subject without prepossessions on one side or the other that the combination of probabilities against such an occurrence are so great as to lead to the

provisional conclusion that our earth is the only inhabited planet in the whole stellar universe.

LONDON, ENGLAND.

The Footstep of Fear

By L. H. Hammond

IT was Christine's friend, Tom, through whom Fear entered the child's life.

Before Tom began to spend his evenings in the kitchen Christine had been the most considerate of nurses. When she tucked the bedclothes about her small charge at night, and sat beside her until the little one fell asleep, her talk had been all of fairies, and hawthorn hedges, and the green English fields in which she had played as a child; but when Tom began to wait for her below stairs—to wait in the company of Ellen, the jolly cook, and Maggie, the blue-eyed housemaid, Christine had grown cross and impatient. She undressed the little girl almost roughly, and even hurried her through her prayers. When she tucked her in bed she refused to sit beside her; and in answer to the child's half-suppressed sob she paused in the act of turning out the gas to bend close above the small pillow and the suddenly widened eyes that stared at her in the dimmed light. Her voice itself was a threat as she opened the door in the child's soul by which Fear might enter in.

"As long as you are good nothing will hurt you," she concluded, more kindly. "Be quiet and don't tell and you're all right." She turned the gas quite out, and closed the door, leaving Fear to watch in her place by the bed.

Not that the child called it Fear; she knew no name for the vague, formless thing. But its formlessness was an added terror, which was heightened by the fact that to her strained imagination an audible footfall came from that void which was its presence, while above its awful shapelessness she felt, tho she never saw—a face. Beast, monster, devil—whether one or all of these she

could not say; and only because a thing spoken of must be designated by a word could one call the dark impersonal presence It.

Every night after this It came, a terrible black emptiness moving with slow, steady steps to the child's bed. The steps fell first in the long hall, when Christine turned out the nursery gas. As she went out she moved noiselessly over the thick carpet toward the door which led to the back hall, and the progress of her retreat was known to the cowering child only by the sound of the other's stealthy approach—a sound distinctly heard above the heavy beating of her own heart. It moved a step nearer for every step that Christine moved away; when she stood at the door of the back hall It stood at the nursery door, always; when she opened the door—softly, lest it should be known down stairs that she had left the nursery before sleep came to its small inmate—It entered; and when Christine closed the door behind her It sprang with a great leap to the child's bedside, and hung over her in the dark, mowing and gibing, with an awful threat behind its senseless leer. She could never see the face nor the leer; if she could have done that she might have borne it; she only felt them through the shuddering dark.

And It was not alone; the tiger under the bed belonged to It, and the ape in the closet, and the man with the black mask and the sword. These also were unseen enemies, but she knew all about them; Christine had told her, not only on that first dreadful night, but often since. They were friends of Christine's, in some mysterious way, and so long as the child obeyed her they were not to be feared; but if she ever cried, or

called her mother, or told any one that Christine did not stay with her until she was asleep—then they would spring at her in the dark and tear her limb from limb. If she obeyed she was safe; Christine said so, and Christine never told lies; she said she never did; and, besides, she would be afraid to tell lies, because liars were put in the fire and burned up. Her brother told her that the day she promised to let him play with her best doll in his own way, and then snatched her away and ran to Christine with her. She was a liar; she shivered as she thought of the lake of fire. But he was digging Miss Homer's eyes out of her head—her beautiful eyes—to see why they didn't shut faster. God would burn her up; but it wasn't fair when other people made you tell lies; perhaps God did something to them, too. But He wouldn't do anything to Christine; she was always good. That was why the tiger loved her, and the man, and the ape; they hated bad people—oh, did they know she was a liar? She shrank further down under the bedclothes. Christine said they wouldn't hurt her if she kept still; but Christine didn't know about It. It would not mind Christine; It would not mind anybody; and It was the tiger's friend, too! She dared not open her eyes, but she knew that in the dark It was bending down, and that the tiger had crawled to the edge of the bed to lick It's hand. The ape peered out of the closet grinning a welcome to It, and the man in the mask stood just behind. They were all It's friends, and It hated her. But it was so dark; perhaps they could not see her—tho she knew in the depths of her cowering little soul that they did. Perhaps she could spring out of bed on the other side, and reach the hall door before It or the tiger could catch her. But the closet! she would have to pass that. She felt the ape's skinny fingers, and the man's sword at her throat. It bent closer over the bed; did It know what she had been about to do?

Time dragged by. The door-bell rang, and company came in. Laughter floated up the stairs, and It grinned hideously at the thought of the company in the nursery. Once her mother sang, and that comforted her. Ages afterward her

mother came upstairs. The man and the ape drew back into the depths of the closet; the tiger crawled to the exact middle of the space under the bed and curled his tail up carefully; It passed noiselessly to the other side of the room, and hid in the shadows as the door opened, and her mother—her dearest mother—came in and bent down to kiss her cheek. She dared not stir, but she knew that It was gone. Her mother touched her forehead gently. "The child is in a perspiration," she said to herself; "but there doesn't seem to be too much cover; Christine is so careful. How fast asleep she is!" and with another kiss she went through into her own room, leaving the connecting door open. When she put out her light It slipped back, but the door was open, and It did not dare to come very close to the bed. The tiger had gone to sleep, and the ape and the man knew her mother was there; they were afraid—oho! The little body relaxed, the breath came freely, and out on the full tide of sleep she drifted beyond It's reach.

This happened many nights, through many years. At first It never dared to come in the daytime; but at dusk she knew the stealthy footfall was coming steadily to meet her, and that in the dark It would stand by her bed, with its horrible, unseen leer. She had, as she grew older, tried the effect of leaving her gas burning; but in the loneliness and silence of the night It was all-powerful, and could shroud itself in darkness and light alike. Every night her mother came to give her a last good-night kiss, but the child never told her that she was awake; she was afraid to speak of It at night, and in the daytime she was ashamed.

She no longer believed in the tiger or the ape, tho she looked for them under the bed and in the closet every night to make sure, and took off her slippers in the middle of the room to leap into the bed from a distance, feeling cold, sharp claws on her ankles as she did so, and tucking the covers about her with feverish haste. The man was no longer in the closet, and had lost his mask and his sword. He carried a knife now, and came with It. The two crept up the stairs together night after night. Some-

times they paused at her mother's door, or her brother's, instead of at her own, and she would spring out of bed to call them before it should be too late. But she was ashamed to give a false alarm, so she always lit the gas in the hall first, shaking with cold, her teeth chattering; and always, as she turned with wide eyes to face them, they were gone. She would rush to the head of the stairs after them, but they could not be seen, tho the stairs creaked, one by one, under their invisible tread. She could never understand why the sound did not rouse the world. Sometimes, in a frenzy of terror to which anything was better than uncertainty, she fled after them, barefooted and silent. It mattered little at such times that the man might turn in the darkness and plunge his knife into her heart, if only she could seize It by the throat and turn it to the light and look once full in its face. To do that meant death or freedom, she knew; and there were times when she cared little which it might be. At every point she strove to face the thing she feared; and at every point it eluded her, and stood, unseen, but felt, a little further down her path.

Years afterward, when she married, the footstep which had dogged her life began to track the man she loved; then it followed the child. The daytime ceased to protect her. Through the long summers in every lightning flash It's lean finger threatened them both; and when the wild Western winds shook the house It leered at her through the storm. Day and night It's power grew with her love, and tho she still struggled it was without hope.

But one night as she lay in her bed thinking a mother's thoughts about the child asleep in the crib beside her, the little one awoke, crying out in sudden fear. As she turned to soothe her It thrust itself with quick, noiseless step between her bed and the crib. She felt through her soul the horror of the unspoken threat, but she leaned toward the child and quieted it. Then something new and strong rose up within her, and through the darkness she looked full where she felt It's face.

"You shall never touch the child," she said. "I will fill her life so full of love and courage that there will be no room

in it for you to come. You may darken my life as you will, but the child shall never know that you exist."

It drew closer, and as she faced It's nearing presence she knew that It's face was distorted by a thousand passions; but the child's hand lay in hers, and tho she trembled, she smiled in the dark.

Often the man she loved was called from home, and through the long nights and stormy days of that wind-cursed country she fought with It for the child. When the boy came she had a double strength, and with the baby she knew herself invincible. They grew up happy and unafraid; for if terror threatened their childish hearts it vanished before love's magic touch. Love filled their days and nights, and ruled their world, and gave them wisdom for an impregnable defense. Absorbed in this struggle the woman fought her own fears no longer, and thought of them only when she must. Her consciousness of It became focused in a determination to keep a like consciousness out of her children's lives.

The years passed by. Never once had her old desire been granted to her—to see the vague terror take the tangible shape of danger before her eyes, that she might face her fear and find in its actual presence either the freedom for which she longed or the death to which she had once been indifferent.

But one morning when the man she loved was away from home and the children were at school she glanced up from her sewing and saw two men come in at the gate. Either of them might have been It made visible to the eyes of day, so evil were their faces. The old house was a detached one, set in a large yard, and there was no one on the place at the moment except herself and the housemaid. Accustomed to forestalling the fears of others rather than to thinking of her own, she went herself to the door; the maid, she knew, would be frightened. She opened the door a little way, and in answer to the younger man's demand for money replied that she had none to give him. The man swore a great oath, which was echoed by his companion. She had opened the door such a little way that they knew the house was empty save for women.

"We will come in and see what you have got," said the man, "and what we want we will take." He set his shoulder to the door.

A sudden rage rushed upon her and swept her out beyond all knowledge of herself. She flung the door wide and stepped up close to the man, her eyes blazing into his. She spoke in a new voice.

"I will give you ten seconds to get outside that gate," she said. "Now go."

They turned and fled. She stood and watched them as they ran down the walk, under the flickering shadows of the elms,

her anger still hot within her. Then she leaned against the doorway, trembling, for she caught suddenly the sound of a stealthy step, which fled before the men, and knew that three passed out at the gate. The men's shoes clattered on the brick walk; but the sound that rang to heaven was the hurrying tread of the silent footfall, whose terror had filled her life. She stood listening through the clear sunshine until it ceased, knowing that it ceased for all time. Then she turned and went into the house with the light of freedom on her face.

WHITESBURG, TENN.

Why Not Iceland?

By the Rev. Francis E. Clark, D.D.

PRESIDENT OF THE UNITED SOCIETY OF CHRISTIAN ENDEAVOR

NOW that Uncle Sam is reaching out his long and capacious arms to many parts of the world, I have often wondered why he did not cast an eye, not a covetous eye, but one in which there is at least a sparkle of acquisitiveness, on the great island of the Arctic Seas known to us by the unprepossessing name of Iceland. He has been haggling with the Danish Government for some little bits of her territory in the West Indies, and long before this, were it not for the stubborn opposition of the Danish Parliament, would have concluded a bargain, which would have been as fair and generous for Denmark and for the islands themselves as it would have been profitable to him. But all this time he has left out of account apparently an island many times larger than all of them, and in some particulars, at least, many times more important.

Iceland in point of size ranks fourteenth among the islands of the world, having an area of 39,740 square miles. It is larger than Ireland by one-sixth, and only a little smaller than Newfoundland. Our new possession of Luzon in the Philippines is larger by almost three thousand square miles, while Mindanao ranks next to Iceland in size, being only a little larger than Iceland. Tasmania,

Ceylon, Formosa, Sicily and other famous islands are far smaller, while Hawaii, Jamaica and Corsica are only about one-tenth of the size of Iceland.

In point of size, Iceland would indeed be a noble acquisition of territory, and tho, to be sure, it can boast no luxuriant vegetation, and has many thousand square miles of fire-scarred desert, or snow-covered jokull, it is by no means the utterly inhospitable and dreary land which the fancy of many people paints it.

A visit to this remote island last summer showed me that it had possibilities as yet largely undeveloped, and that in some ways it holds a strategic position between the continents.

It is now almost a treeless island, tho when the Northmen first discovered it, a thousand years ago, it is said there were trees of sufficient size for shipbuilding and house building. Now they are reduced to two lonely specimens in the northern part of the island, which are visited as great curiosities by the inhabitants, most of whom have never seen a tree in all their lives. Scanty shrubs and a brush growth, which rarely attain a height of more than three or four feet, take the place of the forests that greeted the eyes of the Northmen, but it is said

by well-informed people that forest fires and the nibbling teeth of innumerable sheep have kept down the growth of large trees, and that the island could be again reforested if sufficient pains were taken. Experiments are already under way in this direction with considerable hope of success.

The mineral resources of Iceland, too, are, so far as is now known, very meager, tho it is altogether probable that a more careful exploration of the island would reveal sources of wealth of this sort which are now undreamed of. But all the sources of productive wealth are not found in mines or forests or even in a varied agriculture. There are vast plains in Iceland that might support millions of cattle and tens of millions of sheep, and any number of the hardy little ponies that are so useful, and which provide in fact the only means of locomotion aside from that furnished by the old-fashioned, primitive form of "Foot, Walker & Co." Sheep, cattle and ponies all take care of themselves during the Icelandic summer, and sufficient hay can be raised to carry them through the long winter, even if their numbers were multiplied many fold.

A well-known lawyer in Reykjavik, a native of the island, and a man of wide observation and travel, tells me that one-third of the land of Iceland can be easily put into tillage or pasturage, but that less than one-hundredth of it is cultivated at the present time. I will not vouch for his estimate, but it is undoubtedly true, that with sufficient capital, and with modern enterprise infused into the business, the sheep and cattle trade might be greatly extended.

Another vast and incalculable source of wealth for Iceland comes from the all-encompassing seas. There are no such cod fisheries in the world to-day as in the waters that surround Iceland, while halibut, sole and a multitude of other edible fishes are also to be caught in the deep sea. The rivers swarm with salmon and trout of the finest quality and of the largest size, and every year attract many sportsmen, and others who do not claim that title, but confess themselves disciples of the gentle Izaak.

Whales abound, too, in these Northern waters as well as fish. In the summer time

one sees in every direction the black trail made by the smoke of the seiners from many lands, who are obliged by law to keep three miles off the shore, but yet do incalculable damage to the industry of the poor Icelanders by robbing the waters far and wide of their chief support, the codfish. Many are the complaints concerning these foreign trawlers, but the Danish Government is either unwilling or unable to secure the full rights of the Icelanders to their chief source of wealth.

The people of Iceland, tho comparatively few in numbers, form the most desirable class of citizens that could be annexed to the domains of a free republic, where universal education and a high moral standard are the first essentials. Tho there are only about 80,000 people in the whole island, every man and woman, and every child above ten years of age, can read and write. Education is practically universal. The peripatetic schoolmaster goes from farm house to farm house in the winter, teaching the young ideas how to shoot, and, tho villages are unknown, with the exception of a very few places on the sea coast, and public schools are out of the question when farm houses are from three to ten miles apart, yet the schoolmaster has done his business to such good purpose that there is probably less illiteracy in Iceland than in any nation in the world.

The people, too, are a sober, industrious, hard working, God fearing race. They love their country with an intense devotion, they respect the church, and are all communicants according to the Lutheran forms. They are not averse to innovations of modern civilization, but would welcome these benefits gladly if their means allowed them to indulge in such luxuries. They are progressive as well as intelligent, and would add a noble element to the varied and polyglot population of the United States.

Furthermore, they have, as is well known, a noble literature and hoary traditions, which would make them, in the latter respect, at least, the most noteworthy element in our cosmopolitan life. In the year 1000 Christianity was adopted by the Althing, and with it, we are told, "the Icelanders obtained pens, ink and parchment, and developed a marvelous

literary activity, producing the eddas and sagas which constitute the undying glory of this remarkable people." If we have no ancient ruins in America of civilized life, we could at least have a hoary literature, and a poetry older than Chaucer's, if Iceland were annexed as one of the sovereign States of the Union. These sagas were put in writing in the eleventh century, it is said, and are a typical and peculiar form of literature that begins with the story of the family when it first settled in the country, giving the life of the hero through childhood, youth and subsequent manhood, relating his battles, his prowess, and his final fate, while, if the hero happened to be a scald, a poet, as was often the case, the prose narrative is interspersed with his poems.

This acquisition of an ancient literature would, indeed, be but a sentimental advantage, but is worthy of consideration when we are annexing peoples and tribes which, when weighed in the balances all together, would not in intellectual ability and vigor balance a single Icelandic family, that can trace its history back to the early Vikings.

Furthermore, the Icelanders, by their very circumstances and geographical situation just beneath the Arctic Circle, have been obliged for many generations to live the strenuous life. They have had to battle with cold and hunger and privations of all kinds. A splendid national character is the result. No effeminate, tropical tribe do we find clustering around the snowy peaks of Mount Hecla. No race of weaklings could have lived for so many centuries at the very foot of the Aurora Borealis. Only the fittest have survived, and these fittest are worthy to live under more happy conditions than they have ever yet known, if physical, moral and intellectual worth are to be considered.

In picturesque and interesting landscape features Iceland has nothing to suffer in comparison with the most attractive countries in the world. The famous Thingvellir, where a thousand years ago the Althing met, and where it continued to meet until comparatively recent times, is one of the most picturesque and remarkable spots in the wide world. Thirty-five miles from Reykjavik

on the seashore, almost directly inland, lies this wonderful natural parliament house. Suddenly without warning the road enters a narrow defile. The ragged rocks tower on either hand for nearly a hundred feet with their black, precipitous walls, and we realize that we are in the famous Almannanagja, or "All-Men's-Rift," by which the Althing, or Icelandic parliament, a thousand years ago entered their unique meeting place under the open sky on the greensward, the grandest and most awful house of parliament in all the world.

Of special romantic interest is the Iclander himself, since his ancestors first discovered our own shores, a half century before Columbus sighted San Salvador. Wherever the ancient site of Norumbega is buried, and its grave will probably never be fully identified, Leif Ericsson and his comrades must have the honor and glory of first bringing Western civilization to our shores.

The strategic position of Iceland between the nations is well worthy of careful consideration. An examination of a map of the world will show how it lies almost exactly in the center of the North Atlantic Ocean, between Greenland and Scandinavia—a little nearer to Greenland, to be sure, and seeming to belong more to America than to Europe. Indeed, Iceland is largely in the Western Hemisphere, Reykjavik, the capital, and the larger part of the island belonging to our own half of the world. Should there ever be serious trouble between America and Europe, which may heaven forbid! Iceland would be of immense value to the naval power that owned it. Here could be established a magnificent base of supplies, and from this base the North Atlantic could be dominated. Tho it is so near to Greenland, it is not far from Europe, only five hundred miles from the north of Scotland to the south of Iceland, and about the same distance from the east coast of Iceland to the west-end of Norway.

The harbors are many and magnificent. Reykjavik lies at the end of an immense bay, the Saxafjord, as it is called, tho it has few of the characteristics which we usually associate with a Norwegian fjord, being a vast and generous expanse of water, partially inclosed by two jut-

ting points of land, on the end of which rises Sneaeffelljokull, three thousand feet in the air, clad perpetually with virgin snow. The harbors on the north of the island are far better than on the south, and in every respect it would make a splendid base of supplies.

All these suggestions concerning the possible acquisition of this "Lady of the Snows" by chivalrous Uncle Sam are based on the supposition that the United States would wish to offer a fair price, and that Denmark would be willing to sell this island of hers, which in her present condition she is unable adequately to develop, and would be utterly unable to protect in case of war. I would suggest, of course, no forcible acquisition and no expansion by might of arms, but it is altogether conceivable, and altogether probable, if not certain, that such an exchange of ownership would result in the happiness of both parties to the transaction.

But supposing "Barkis is willin'," it may be asked if Iceland herself desires to be wooed and won. There is no way of finding out perhaps unless Uncle Sam follows the example of other bashful men and "pops the question" for himself, but it is very certain that Iceland has no special regard for her mother country, or the country that now acts *in loco parentis*. The real mother country of Iceland is Norway, from which for many years she has been politically separated.

The Icelanders have very little love, evidently, for the Danes. Most of their ancient grievances have been redressed, to be sure, and they have a government as free as can be desired. They hold the same relation to Denmark that Canada does to Great Britain, and are practically a free and independent people, yet it is

a very slender tie that binds them to their suzerain power. There is little doubt that they would be very willing to change their allegiance if material improvements and advantages were assured. There are also few sentimental bonds that link them to Denmark, and they feel that the little kingdom in the North Seas is unable to give them much assistance or to develop their land.

Just now many Icelanders look, no doubt, to England, and would welcome, as some have told me, British intervention and ownership. Their communication is more direct with Great Britain than with any other country. A monthly line of steamers that starts from Copenhagen sails directly between Leith and Reykjavik, carrying British goods and British ideas every month, and many British sportsmen every summer. The only fuel available besides a little peat in the bogs near Reykjavik is coal from Newcastle, and in many ways Iceland is dependent commercially upon Great Britain.

However, there is no special attachment, so far as I could learn, to the British people or the British Government, and a kindred Power like ourselves which could develop the resources of Iceland and guarantee her liberties, her laws and her rights, especially a Power that could incorporate her territory into the Union as an integral part of the Republic, would, I have no doubt, be welcomed warmly by the people themselves. At any rate, if the genius of American expansion is seeking for new worlds to conquer or new lands to annex for his own advantage, or for the sake of benevolently assimilating, improving and advancing the interests of other peoples, he may well ask the question, "Why not Iceland?"

BOSTON, MASS.

The Achievement of Mr. Henley

By Lawrence Gilman

WITH the death of William Ernest Henley there passed quite the most robust and vivid figure in contemporary letters. Both in poetry and in prose, Mr. Henley's achievement was brilliant in a manner and degree without parallel in the literature of to-day. None had, in poetry, precisely his consuming intensity of expression, his emotional luxuriance, his riotous extremity of mood. In prose he was unique in audacity, in penetration, in a certain extraordinary and compelling alliance of distinction and gusto, of precision and virility.

No one, probably, in estimating his essential work—his verse—would claim for him the considerable virtues of balance, vision and width of range. He was pre-eminently a poet of wilful impulse. He looked upon life, not steadily and directly, but obliquely—as in a mirror which, while it often showed him a world where life wore such a veritable front of beauty as he saw, more often showed him a world distorted and obscured, filled with strange shapes of terror and despair, or grimmer presences of shuddering and bitter portent. And yet, for all the reservations that one must make in appraising the measure of his accomplishment, how admirable, how engrossing, how incomparable he was at his best! Where else, in any body of lyric writing, will you find just that commingling of exuberance and intensity, that prodigal and vibrant loveliness, that unconquerable vitality that were his? "How can we pass," wrote Walter Pater, in one of his most arresting passages—"how can we pass most swiftly from point to point, and be present always at the focus where the greatest number of vital forces unite in their purest energy?" Mr. Henley lived, as it seemed, continually at that burning focus. His utterances were quick and urgent with the joy of earth, the immediate, sensuous delight in bodily things. He had, in an obviously limited measure, the order of temperament which, in the fullness of its magnificence, was Wagner's. His sensibility was acute, his power of definite expression marvelously rich and strong. And he

was a master of moods; he traversed, with superb and astonishing impetuosity, the full emotional gamut. His verse has the pliancy and the textural richness of modern music; its responsiveness, its eloquent fluency, were, in his hands, astonishing and unique.

Read, for example, his *Præludium*—a hymn to Autumn—with its plangent tonal imagery:

"In sumptuous chords, and strange,
Through rich yet poignant harmonies:
Subtle and strong browns, reds
Magnificent with death and the pride of death,
Thin, clamant greens
And delicate yellows that exhaust
The exquisite chromatics of decay;
From ruining gardens, from reluctant woods—
Dear, multitudinously reluctant woods!—
And sere margents, forced
To be lean and bare and perished grace by
 grace,
And flower by flower discharmed,
Comes, to a purpose none,
Not even the Scornor, which is the Fool, can
 blink,
The dead-march of the year."

And, for a vivid contrast, how gravely poignant is he in this:

"Dear hands, so many times so much
When the spent year was green and prime,
Come, take your fill, and touch
This one poor time.

Dear lips, that could not leave unsaid
One sweet-souled syllable of delight,
Once more—and be as dead
In the dead night.

Dear eyes, so fond to read in mine
The message of our counted years,
Look your proud last, nor shine
Through tears—through tears."

He has left us, in collected form, his "Book of Verses," his "Song of the Sword," his "English Lyrics," his "Poems," "London Voluntaries" and "Hawthorn and Lavender." It is not a large output, in the mere matter of bulk, nor is it by any means consistent in excellence. For my part, I could wish that he might have spent the energy which went to the fusing of such things as the "London Types" and the series "In Hospital" in the evolution of another

such volume as his "Book of Verses." But it is in his last published collection of verse—his "Hawthorn and Laver" —that he is, perhaps, most persuasively and completely himself. Along with the old and accustomed note of passionate and piercing fervor, the old defiance and revolt, there is a new, a persistent note of serene and buoyant gayety, a finer insight, a deeper spiritual fortitude. Here, in his swan-song, there is more than one such lyric as this, not less lovely and matured:

"Your feet as glad
And light as a dove's homing wings, you
came—

Came with your sweets to fill my hands,
My sense with your perfume.

We closed with lips
Grown weary and fain with longing from
afar,

The while your grave, enamored eyes
Drank down the dream in mine.

Till the great need
So lovely and so instant grew, it seemed
The embodied Spirit of the Spring
Hung at me, heart on heart."

It is well that he was able to leave us this final and treasured legacy of his genius; it hightens, if it does not perfect, an achievement of superb and memorable consequence.

NEW YORK CITY.

Summer Clouds

By Thomas Pardon Wilson

THEY are ships without rudder or topmast or sail;
They are ships without captain or sailor or cook.
Their decks are not guarded by canvas or rail,
And there's no place to stand whence the watchman can look.
They are ships without chart, without compass or spar;
They are ships without capstan or anchor or chain;
And they sail without aid of a planet or star;
Nor reckon they aught or of loss or of gain.
They follow no well beaten paths through the sky,
O'er which they are seemingly sailing in sport;
And the prow from the stern is not easy to spy,
While the starboard is not to be told from the port.
They are built not of iron, or oak, or of pine;
Their sides are not sheeted with coatings of steel;
They've no log to mark with its unerring line
The knots as they fly from the nautical reel.
They are wanting in armament suited for war;
They are destitute quite of cannon and shell;
But when they do battle, they're heard from afar,
And their lightnings seem born in the bosom of hell.
They come from no country familiar to men;
Over mountain and ocean like spirits they rise;
And the port they are seeking—there's no mortal ken,
To tell where it is, or even surmise.
Their changeable color confuses the eye,
They have caught the chameleon's mystical art.
One moment with hues of the rainbow they vie
And while we are gazing their glories depart.
Oh, tenuous ships of the measureless air!
Sail on o'er the depths of the fathomless blue;
In beauty ye hail from the land of the fair,
And vanish from sight like the sweet morning dew.

DETROIT, MICH.

Italian Feeling on American Lynching

By Senator Augusto Pierantoni

[Senator Pierantoni is the greatest authority on international law in Italy, although his political career began, like that of other Italian politicians of his generation, as a volunteer with Garibaldi. He has been Professor of International Law since 1865, and has written many books on this subject, some of which are in regard to America, as his opinion was asked at the time of the famous Alabama question. He has also written a very remarkable study on the Hispano-American conflict.—EDITOR.]

I PRESENT in this short article the feelings and reasons which the Italian Government and Parliament express, to obtain from the great Federation of the United States, legislative measures sufficient to prevent the slaughter of the so-called lynchings, thus confirming the bonds of brotherhood between these two civilized nations. Public opinion, the true Queen of Humanity, must be illuminated by those who wish the triumph of law over violence, of constitutional order over anarchy.

The Italians, during their bondage, looked upon America as a cherished asylum of liberty, and there emigrated those persecuted by the several tyrannies against which the Monroe Doctrine was proclaimed. After the National Unity was formed Italian emigration became more frequent, owing to the easier means of navigation. Our country knew that the American Constitution recognizes the right of immigration, and promises full personal safety when it says that:

"The privilege of the writ of *habeas corpus* shall not be suspended, unless, when in cases of rebellion by invasion, the public safety may require it. No bill of attainder or *ex post facto* law shall be passed."

The treaty of February, 1871, between the United States and Italy stipulates that:

"The citizens of each of the high contracting parties shall receive in the States and Territories of the other most constant protection and security for their persons and property, and shall enjoy in this respect the same rights and privileges as are or shall be granted to the natives, on their submitting themselves to the conditions imposed upon the natives."

We must note that protection and security were promised in the States as well as in the Territories, as we know the difference between the two. Chief Justice Marshall described the Terri-

tories as being "in a state of infancy advancing to manhood, looking forward to complete equality as soon as that state of manhood shall be attained."

Up to 1891 Italians knew only confusedly the cases comprised under the word lynching. The popular instinct of revenge is understood, as when criminals guilty of rape, incendiarism, murder, are surprised *in flagrante delicto*; or lynch law can be understood in territories where law, judges, prison, police, are still lacking, and criminals commit all kinds of violence. The facts of California are well known. It is not allowable to regard as such lynching the deliberate slaughter of foreigners who submit themselves to the law, were or are in prison and were acquitted, or are waiting for a sentence. All the lynchings of Italians have been horrid massacres. In 1891, in New Orleans, some Sicilians, tried for the murder of the Chief of Police of the city, were taken from the prison and eleven were put to death. In March, 1895, in Colorado, three Italian prisoners were put to death. In August, 1896, at Hahnville, La., six Italians confined in the parish jail, charged with murder, were taken therefrom and three of them lynched. At Tallulah, La., in 1899, five Italians were removed from the prison and hanged by a mob. In each of these cases it was found impossible, on account of local sentiment, successfully to prosecute the perpetrators of these crimes in the local courts.

For each of these violations of international obligations the Italian Government protested to the President of the United States, as the Federal system cannot relieve America from international responsibility. In fact every State on entering the Union renounces its sovereignty and is subject to the Federal authority, as defined by the Constitution; and the powers vested in the Na-

tional Government must regulate foreign relations. The National Government has the judicial power in certain classes of cases which Congress must settle by law.

The diplomatic correspondence between Italy and the Government of the United States, presented to the Senate, proves that the then Italian Ambassador Baron Fava, following the instructions received from the Ministry of Foreign Affairs, declared, "that the entire solution of the difficulty is found in the treaty in force between the United States and Italy," and he asked measures "to prevent the repetition of such atrocious crimes and at the same time just and adequate compensation to the families of the victims."

The great agitation that these facts produced in the press of the Peninsula, arousing heated discussion in the Legislative Chambers, calmed down at once when the news circulated that President Harrison, in the yearly message to the two Houses, recalled that since December, 1890, he had said that Congress should be entirely competent to make offenses against the treaty rights of foreigners domiciled in the United States cognizable in the Federal Courts. Mr. Foraker presented a bill to provide for the punishment of violations of the treaty rights of aliens. A bill was introduced in the Senate, March 1st, 1892, and reported favorably March 30th. President McKinley recommended that the subject be taken up during the session.

The Presidential elections first, then the war with Spain, interrupted this legislative work.

I will not conceal the feeling dominating the popular classes, which were much displeased that the indemnities paid were very small, and given, not as a duty, but as a generous help. Public opinion learned with sorrow that the Italian working classes were the target of the hatred and violence of the mob, like the Chinese, as tho the Italians were an inferior race. The President of the United States said that lynching is sometimes committed even against American citizens. But who are they? Negroes. I will not discuss here the important question of the relations which should exist

between negroes and whites, in eight States, among which is Louisiana, the land where most Italian blood has been shed. Studying the progress toward civilization made by races originally barbarous, Italian feeling rebels on hearing that our peasants are compared to Asiatics or negroes, altho I say with Manzoni: "*Tutti fatti a sembianza di un altro.*" We are all made in the image of only One.

The Italian immigrants from the agriculturist and working classes have been despised as being not yet fitted to participate in the political life of the country where they settled, being considered incompetent to give an intelligent vote. Several writers have lamented the diminution in the immigration of those who are of the language and race of the Americans, and have deplored the increased number of immigrants lacking these affinities. Italian immigrants have been especially despised, because the majority from the south of the Peninsula do not know how to read and write, and are represented as the lowest Italian type of character and intelligence, because of their bringing little capital and because they do not immigrate to remain, but to return home. Even their sobriety of life and their virtue of resignation displeased. Senator Lodge, in the *North American Review*, deplored that they are a cause of the lowering of wages and that they export their savings. I understand how grave is the anxiety of the descendants of the ancient settlers who formed the first colonies and rendered them independent, because of the fact that the population of the United States has so immensely augmented with people of diverse languages, religions, races and customs. Among the early colonists there were elements of unity, but there were also elements of diversity. All spoke the same language, all belonged to the same race, except a few descendants of Dutchmen and Swedes in New York and Delaware, and some Germans in Pennsylvania. All professed the Protestant religion, except some Roman Catholics in Maryland; all were governed by the same English common law. In ideas and habits of life there was less similarity.

The elements which contributed first

to form the nationality may look with concern on immigration, now that her territory is comparatively occupied. However, recent statistics prove that Italian immigration has in the last ten years continually increased, gradually augmenting the number of those who stay permanently. In 1899-1900 the Italians who returned home from the States were 23,340; in 1898-99, 23,942; in 1897-98, 24,987, so that in 1900 it appears that those living in the States amounted to 665,000. The lynchings, and the crisis in work caused by the war with Spain were the principal causes of return to Italy. The last report of Commissioner Fischer states that Italian immigration is preferable to that of Poland, Roumania, Germany and Ireland.

The Italian Government and nation understood the delay suffered by the bill to provide for the punishment of violations of treaty rights of aliens, because of the war and the Presidential elections, and they greeted with applause the Message of the regretted President McKinley, which said:

"Lynching must not be tolerated in a great and civilized country like the United States; courts, not mobs, must execute the penalty of the law. The preservation of public order, the right of discussion, the integrity of the courts and the orderly administration of justice must continue forever."

The lynching of Erwin again agitated public opinion, provoking interrogations in Parliament to the Ministers of Foreign Affairs, Marquis Visconti Venosta and Signor Prinetti. One of the interrogations, discussed in the Senate on December 20th, 1901, was from Baron Fava, who urged the Government to ask President Roosevelt to exercise his legal authority to press the bill against lynching already presented several years before.

On May 7th last the Under Secretary of State for Foreign Affairs, answering in the Chamber an interpellation from Deputy Cirmeni, informed the House that the question is already pending; that President Roosevelt at Arlington denounced lynching most strongly; that Senator Hoar, in the Senate, and Congressman Crumpacker, in the House, had presented two bills to assign to the

Federal authorities the trial of such crimes, but that neither law had been enacted. The Under Secretary expressed the hope that the legislative powers of the United States will recognize that

"The North American nation, which, in so many aspects of social and economic life, is at the head of civilization, receives no honor from these facts, and must feel the duty of protecting the life of both her own citizens and foreigners."

I think that there are two principal obstacles that retard the desired bill. Many Americans think it their duty not to yield to the pressure of a foreign state, while Italy merely invokes what is established by international law and existing treaties; and the Italian *Juriconsults* know that those of America, as well as the Government and the Senate there, recognize the justice of this demand. The other obstacle is the struggle of each State to preserve its independence of the Federal power until now enjoyed.

The Italians more and more invoke justice from the Federal Legislative Assemblies, since the Parliament of the Peninsula has passed the Emigration bill, by which the emigration of dangerous or unhealthy people is forbidden, and passports and other means to prevent crises and conflicts are rendered obligatory, being in advance of America, which only last March approved the law rejecting unhealthy, ignorant and anarchist immigration. I might now quote the unanimous agreement of scholars on International Law who recognize the justice of the desired bill for the punishment of violation of treaty rights of aliens. I will, however, merely recall that Italy invokes the rule which the United States succeeded in having applied in the Alabama question, which ended with the Geneva arbitration. Then the arbitration verdict, not accepting the arguments of England, established that when the existing laws are not sufficient, and the Government has not enough means to oblige its people to respect international duties, it must take active steps.

May I soon see the claims of Italy satisfied in the name of humanity and of international justice.

ROME, ITALY

Home Occupations for Children

By Florence Pray

ALL little children need some occupation at home; and there are many things they can do, and love to do, that will keep them busy and happy, and help along the mental development at the same time. Most educators to-day recognize the close connection between manual and mental training, that the use of the hands surely helps to develop the brain; so the simple occupations of children assume a new importance in our eyes.

The simplest occupation is tearing. The child of two or three years of age can tear, and loves to tear, as mothers can testify. If he has nothing else he will tear books, pictures or anything tearable within his reach. Now, since he loves to tear, why not give him something that he may tear legitimately? He has given us a leading, why not accept Froebel's injunction and "Follow the child?" Give him a newspaper and let him tear it to his heart's content, and when he seems to have exhausted the occupation, suggest that he tear the pieces smaller and make snowflakes. He can amuse himself with the snowflakes a long time by lifting them high and letting them flutter down, and then he may shovel the snow all up (still another occupation) and put it in the scuttle. From the simple tearing of snowflakes he may be led to tear paper in the shape of a ball, an apple, a potato and as many round things as he knows, and as he gets a little older he will enjoy trying to tear a dog, a cow, a horse, etc.

Cutting is a similar occupation to tearing, and a child should begin by cutting from paper things with simple outline, using blunt scissors with which he cannot hurt himself. At first he will have but a vague idea of outline, and it is well to begin with some definite object. If the mother will take a sheet of square paper 4 x 4 or 5 x 5, and cut from it a small square and give it a name, call the small square a window, then cut an oblong and call it a door, and will draw the child's attention to the dif-

ference in shape of the two, the door having two long sides and two short sides, and the window four sides equal (get the child to count the sides), he will understand and will soon be able to cut many things, because he begins to observe the outline of objects. He can cut a flag, a boat, a soldier cap, a house, etc. The mother can help him, too, by giving a name to something he has cut aimlessly, and for which he has no name. If she says: "You don't know what that is? Why it looks to me like a rooster;" the child will gladly call it a rooster, and will observe a rooster more carefully the next time he sees one. He should always feel that picking up the scraps is a part of the occupation. Cutting means scraps, which can be shoveled up like snow or swept up like carpenters' chips.

The love of cutting and tearing, which is merely the instinctive desire of the child to use his hands and exercise his will, and which most parents regard as destructiveness, pure and simple, may thus be utilized to help develop the creative ability of the child; for when he tears paper to make snowflakes he is really transforming material, he is creating. If, on the other hand, he tears paper aimlessly, he is merely destructive. It is very important that he should always feel that he is making something, never that he is merely destroying.

Drawing is another occupation that children love, drawing either with chalk on a blackboard, with lead pencils, or with colored crayons. Of course, at first, with the little child the drawing is mere scribbling; but a mother, by judicious question and suggestions, can lead the child to make "pictures," to draw with an object. Painting, too, is a delight; the mere movement of the brush is a pleasure. After children have painted without restriction for a while it is well to give them an outlined square or circle to "fill in," warning them to be careful to keep within the line. Following this they might paint the pictures which are sold ready to be colored. Then

they can paint from a model "free hand." An orange or an apple is not difficult after having painted the outlined circle. Some of the simple flowers, too, they can paint. It is really wonderful what children can do with painting with the right kind of guidance.

A child likes to stick pins in a cushion; give him a cushion covered with checked linen, and let him find and mark with large headed black pins the points where the lines cross each other. There is no danger of his swallowing the pins when he has something else to do with them. Then he can make rows of soldiers by sticking the pins close together on the lines, short soldiers one check high, and tall soldiers two or three checks high.
